Soda lye, saturated with freshly-prepared silica, is mixed with pure alumina, obtained by precipitation from alum, in such proportions that to thirty-one parts of dry silica there will be twenty-six parts of dry alumina; the whole is evaporated to dryness, pulverized, and mixed with flowers of sulphur; to this is now added a mixture composed of equal parts of dry carbonate of soda and flowers of sulphur; the whole is thoroughly mixed, pressed into a crucible until the latter is full, when it is well covered and rapidly heated to glowing, so that fusion may take place before the sulphur is volatilized. It is then kept at a red heat for two hours. It is left covered until it is entirely cold, and again fused in porous crucibles. The blue mass is then pulverized, well leached, and washed.

The principal modifications of this method are the use of kaolin, of glauber salt, of sulphide of sodium, of alum, of charcoal powder, etc. The product from different manufactories, as exhibited at the Paris Exhibition of 1867, was far from being uniform. Some specimens of it were of a much finer shade of color than others. The simple crucible is now substituted by a reverberatory furnace, and the gigantic scale of its manufacture is one of the wonders of the age."

Graham on Hydrogen.—Prof. Graham, in his experiments on the occlusion of hydrogen by palladium and other metals, employed, besides the metallic cylinders of which we have before spoken, *wire* made of the same metals. This was, at least, the case in reference to palladium. The decrease of density in the cylinders which took place when they were charged, could not be easily measured. But a wire of the same was so markedly increased in length when charged, that the change was easily measured; and the density of the metal hydrogenium thence from calculated. The wire was stretched over a finely graduated surface and loaded with a moderate weight. It was then charged with hydrogen by making it the negative electrode of a small Bunsen's battery. The positive electrode was a thick platinum wire, placed by the side of the palladium wire, within a tall jar of dilute sulphuric acid. An exposure of an hour and a half charged it so that no farther addition to the amount afterwards took place. This was, in volume, 936 times that of the palladium. The increase in length, of the wire,—which was at the commencement nearly twenty-four inches long,—was about ⅜ inch. The density of hydrogenium was by this means found to be 1.708; and several experiments gave nearly similar results.

Secondary Batteries.—The *Journal of the Franklin Institute* condenses as follows such portion of a recent article by M. Gaston Planté, as is necessary to define what secondary batteries are:

"If two leaden plates, plunged into diluted sulphuric acid, are made terminals of a small galvanic battery, the one connected with the negative pole will have its surface rendered perfectly clean and metallic by the reducing action of the hydrogen there liberated, while the opposite plate, connected with the positive pole, will on the other hand be rapidly per-oxidized by the nascent oxygen set free at that point. If, then, the battery being disconnected, these two plates are put into communication, they will be in condition to develop a galvanic current opposite in its direction to that which was before passed through them by the battery. Thus the clean plate or former negative pole will tend to oxidize, decomposing the water of the pile and liberating hydrogen, while the per-oxidized plate will tend to absorb this hydrogen and suffer reduction. These actions are precisely such as are needed to produce a galvanic current, which experience proves to be of very intense character though short duration. Availing ourselves of this fact, it becomes possible to construct what, from its practical result, may be called a *condenser* for *dynamic electricity;* thus we may employ a small battery, during a notable time, to bring a number of connected lead plates into the condition above described, and then use for a few moments the intense current they are able to generate, thus obtaining a concentrated and intense momentary effect from a feeble but continued supply of force; not, as in the Leyden jar or other condenser of statical electricity, by an actual accumulation and storing up of the feeble force, but by the indirect method and through the intervention of the chemical reactions above described."

M. Planté used gutta percha troughs, each containing twenty plates of lead ten inches square, the odd numbers united by a copper strip at one end, and the even ones at the other; the trough being filled with a mixture of ten parts of water to one of sulphuric acid. Two such batteries could be so charged in a few minutes by three small Bunsen cells as to be capable of burning up a steel needle four inches long; and by placing each pair of plates in a separate trough, such intensity was secured that a steel wire six feet long could be instantly fused.

Photography and Fusil Oil.—The *Photographic News* speculates upon the light thrown by Prof. Tyndall's recent experiments upon certain phenomena in photography which have not heretofore been fully understood. The Professor says that actinic light decomposes the vapor of nitrate of amyl. Now fusil oil is the hydrated oxide of amyl. "Fusil oil is known to be a common impurity in ordinary alcohol, and its presence in collodion has long been regarded as conducive to fog, without any knowledge of the reason why. When fusil oil in collodion comes in contact with nitric acid, either free in the bath or liberated by action of free iodine in the collodion, a trace of nitrate of amyl may be formed, and this body, being present in the film when exposed to the action of light, and possibly decomposed, would, under some circumstances, yield as a product valerianic acid; or possibly intermediate bodies, analogous to acetone or aldehyde, might be formed, with a tendency to produce fog."

The Bursting of Water Bottles in Cold Weather.—When a bottle of water is frozen the bottle is usually burst. Hitherto this has been explained by the assertion that the water, on solidifying, suddenly expands. Mr. Barthélemy, one of the professors in the Lyceum of Pau, denies this explanation. In a memoir which he has written on the crystallization of water, he alleges that bursting of the bottle is caused by the disengagement of a large quantity of gas—hitherto in solution—by the water at the moment of its solidification. It is alleged, in support of this, that if a bottle of water be placed outside a window in frosty weather, it will be observed that the rupture takes place at the hottest side, viz., that next the window. *Scientific Opinion.*

New Patents Issued to Pacific Coast Inventors.

Especially reported by the U. S. Patent Office, Washington, D. C., to Dewey & Co., American and Foreign Patent Solicitors, and Publishers of the Mining and Scientific Press.

For the Week Ending March 30.

88,267.—Machine for Fitting Felloes to Wheels.—Frederick H. Brinkkotter, Callahan's Ranch, Cal.:

I claim, 1. The hands B B, secured together on each end of the hub A, for retaining the clamping-frame, substantially as and for the purpose described.

2. The clamping-frame, consisting of the block C, having the longitudinal openings *d d d'* and cap D, together with the block G, yoke F, and screw E, the whole arranged substantially as above described.

3. The clamp K, with its arms *f f*, spring *h*, and rack *i*, for securing the spokes, substantially as herein described.

This device consists, first, in securing to the hub of the wheels on each side of the spokes a circular hand or ring, to which the mechanism for fitting the felloes may be attached; and secondly, in an apparatus for forcing the felloes to the proper position, and retaining the spokes where desired, so that the felloes can be marked previous to having the mortise bored, and also to correct any irregularity in the felloes after it has been mortised and fitted to spokes. This apparatus may be placed opposite to any spoke in the wheel by merely changing its position in the rings or bands around the hub, so that the felloe may be operated upon at any point necessary on its circumference or rim.

88,277.—Dumping Wagon.—John Craig, San Francisco, Cal.:

I claim, 1. The two longitudinal boards C C, hinged to the reaches, and swinging vertically to the center, for depositing the load beneath the wagon, substantially as described.

2. The longitudinal rods E E, angular metal plates *b b*, cranks *e e*, slotted bars F F, and staple I, the whole arranged substantially as and for the purpose described.

The object of this invention is to provide an improved dump wagon for the purpose of quickly unloading the dirt or other substance or material which it may contain, and it consists in arranging the floor or bottom of the wagon on hinges, so that by removing the supports it will turn and deposit the contents of the wagon beneath it. The supports are operated by levers in front of the wagon, and by simply disengaging these levers, which can be done by the teamster without dismounting from the wagon, the supporters are relieved so as to allow the floor to turn.

88,280.—Gang Plow.—Artemas Davidson, San Leandro, Cal. (Antedated March 20, 1869):

I claim, 1. In combination with the arms D D' and axes *a a'*, on the bar C, the clutch, consisting of the jaws F and G, on the wheel and axle, respectively, substantially as and for the purpose described.

2. The pin, or arm H, and the spring M, with the lever E, or equivalent device, for engaging and disengaging the clutch, substantially as described.

3. The rack J, constructed with the lip K, together with the holding-projection L, on the lever E, for retaining the jaws F and G in contact until the plows are raised, substantially as described.

4. The slotted arm D, with its set-screws *c c*, to raise and lower the axle *a*, and adjust the plows, substantially as and for the purpose herein described.

This invention relates to an improvement in gang-plows, whereby the labor of raising the plows and lowering them into the ground is performed by the horses, instead of by hand in the usual way, thus relieving the driver of the necessity of lifting the weight of two or more plows when he wishes to raise or lower them. This is accomplished by means of a coupling, one section of which is fixed to the axle and the other attached to the hub of the wheel. The fixed section is so arranged as to be moved upon the axle from side to side by means of a lever, which will cause them to engage and thus turn the axle and raise the plows.

88,298. — Device for Securing Bed-Clothes.—George Inwood, San Francisco, Cal.:

I claim the clamping-bar D, when held and operated by rods *b*, sliding in or upon the fixed rail or rails of the bedstead, and secured at the proper point by the set-screws *e*, substantially as and for the purpose herein set forth.

This device consists in an improved method of confining bed clothes so that they may not be thrown off while the occupant of the bed is asleep, and is especially serviceable on cribs and children's beds, or for invalids. It consists in simply placing an additional adjustable rail above the permanent bed rail and so arranging it that the bed clothes may be drawn under it, after which it is bound so as to hold them firmly, and is fixed by set screws or other device.

88,300.—Flea Powder.—Charles E. Jaycox, San Francisco, Cal.:

I claim the above ingredients enumerated, mixed and compounded in the manner and in about the proportions specified, substantially as and for the purpose herein described.

This invention provides an improved flea or insect powder which is unusually effective without disagreeable results, as it does not stain or injure any fabric. It is effective for a long time when used in the ordinary manner, and possesses an additional value from the fact that it can be used in washing so that the clothing will be thoroughly impregnated, and the wearer will thus be rendered, as it were, flea proof.

88,324.—Aerial Car.—William Morrow, San Francisco, Cal.:

I claim the combination and arrangement of the supply-pipes E, blowers B, and discharge-pipes F, substantially as and for the purpose forth.

This invention relates to a new mode of propelling aerial vessels, and it consists in providing the machine with two large fans or blowers which are driven by a light engine. The sides of the cases which are ordinarily left open, are closed in these blowers, and are connected by pipes with the front of the vessel, so that the air is drawn in through these pipes. Similar pipes serve for the ejection of the air at the stern of the vessel, so that it is propelled both by drawing in the air and by forcing it out. The steering apparatus may be so arranged as to elevate or depress the machine, as well as to turn it to either side.

88,368.—Spading Machine.—Francis C. Cone, San Francisco, Cal.

I claim, 1. The above-described machine-spade, when provided with an adjustable arm, E, and a cutting-edge, F, projecting in front of the blade G, substantially as set forth.

2. The revolving flanges B, having the tangential slots D, for determining the angle of the spades, substantially as herein described.

3. The notches, or shoulders *a a* in the sides of the slots D, for holding the spades, substantially as herein described.

This device consists in a series of flanges turning loosely on a bearing shaft, and each having a number of arms extending outward from its periphery. At the end of each arm is a spade or knife extending across at right angles to the travel of the machine. These spades are placed at such an angle as to enter the ground vertically as the flanges revolve, and the arms are so placed in and attached to the flanges, that the depth to which the spade enters the ground may be varied, the distances between their edges always remaining equal to the distance from the edge of the flange however it may be varied. The arm is so formed as to give a peculiar cutting edge which is extremely effective in breaking up the turf and clods. The body of the machine is also arranged that the angle at which it stands with reference to the earth may be varied. Weights may also be used to increase the affectiveness of the spades. This machine is intended for very rapid work, and was exhibited with a degree of success, by the inventor, at the Santa Clara County Fair, last fall.

88,384. — Acoustic Stage. — Troutman Groh, San Francisco, Cal.

I claim, 1. The above described floor, consisting of radiating timbers B B, diagonal timbers C C and D, and boards *d d*, when constructed substantially in the manner and for the purposes set forth.

2. In combination with the above claimed floor, the posts *a a*, blocks *c c*, intervening glasses *b b*, and the sounding-post E, arranged to support said floor, substantially as described.

This stage is intended principally for orchestras, to strengthen the tone of instruments used upon it, giving a facility for small orchestras to produce loud and harmonious music, It is calculated to give every instrument its full power and sweetness of tone. The stage is built as nearly as possible in accordance with the principles of the sounding board of stringed instruments, and is arranged to accord with the nature of the instruments by placing each one on the particular part of the stage suited to its tone or gamut, so that the vibrations of the instrument will be taken up by the stage and given to the audience in a full clear tone. The stage stands elevated an inch or two above the floor, upon blocks of wood which rest on blocks of flint glass. The floor of the stage rests upon wooden rails which pass diagonally across the top (being nearer together at one end than the other) under which are placed braces at one corner and the center passing across at right angles to them. Passing downward to the floor from the middle of the center brace is a sounding post which is some two or three inches longer than the supporting posts on the sides, causing the center of the stage to be higher than any other part. The floor of the stage is made of thin strips of dry spruce or other suitable wood, which are placed across the top of the stage diagonal to the wooden rails directly beneath them.

88,404. — Bottle-Corking Apparatus. — Giacomo Migliavacca, Napa, Cal. (Antedated March 19, 1869.)

I claim, 1. The vertically-moving block C, with the inclined operating-gauge *b*, and the parallel retaining-bars *c c'*, the whole constructed and arranged substantially as herein described.

2. The block D, with its tapering passage *e*, with the plunger E, the bent arm *g*, and the hand-lever F, substantially as and for the purpose described.

This machine consists of base having an upright standard attached to it near one end; upon this standard at a convenient height is attached a semi-circular block having a tapering hole through it, sufficiently large to admit a cork. A block of wood or metal is placed under the semi-circular block at the foot of the standard upon which the bottle to be corked is placed, when the block is moved up by a bar which moves back and forth in a slot in the base, and which has in its upper side an inclined plane. By moving this sliding bar towards the block, the bottle is raised up until its mouth strikes the block directly under the hole in the semi-circular block, when the cork, which has been placed in the hole in the semi-circular block is forced down and compressed into the neck of the bottle by a cone shaped pin, attached to the lower end of a bent arm, which is operated by a lever at the back of the upright standard.

88,460.—Machine for Cutting Screws.—John Dougherty, San Francisco, Cal.

I claim, 1. Arranging together, a screw-threading machine, in the manner described, the feed-screw P, carriage D, worm-wheel H, and worm-chuck G, each being constructed as shown and described.

2. The arrangement, on the two rotating shafts, of the loose gears X V, fast gears W, and head-stock S, as and for the purpose specified.

88,329.—Grape-Crusher and Stem-Separator.—Turner C. Purington, Lincoln, Cal.:

I claim, 1. The half-oval crusher C, attached to the shaft D by the arms E E, and imparting to it a reciprocating, or to-and-fro movement, whereby the grapes are deprived of their stems, and crushed beneath upon the grated bottom of the machine, substantially as described.

2. The combination and arrangement of the grated bottom B B B' B', with the crusher C, substantially as and for the purpose specified.

The complete report upon the Precious Metals at the Paris Exposition has been issued from the government printing office, and received by us from the Commissioner for California, W. P. Blake. It makes an exceedingly valuable book of 360 pages octavo.

New Commissioner of Patents.—S. S. Fisher, of Ohio, has been appointed by the President as Commissioner of Patents, to supersede the Hon. Elisha Foote, the present incumbent. The Senate will have to approve of the appointment before it can take effect.

New Inventions.

A Washington Invention.—Among the patents issued on the 24th inst. was one to I. A. Heald, the leader of the Washington brass band, for a machine for the manufacture of cigars. Mr. Heald had devoted a great portion of his time for the past ten or twelve years to the study of this matter, and has at last perfected a machine which will turn out from 1,500 to 2,000 cigars daily, and requires but a child to attend it. When we consider that there are 40[illegible],000 cigars smoked daily in the city of New York alone, the value of this labor-saving machine will be readily appreciated. *Washington Chronicle.*

Having seen the above machine in the process of manufacture, we must say it is one of the most ingenious inventions we have ever seen. Mr. Heald is an indomitable mechanic and inventor, and worthy of marked success.

Important Invention for Boot and Shoe Manufacturers.—Evan T. Rogers, of San Francisco, has invented a new system for marking counters and straps, and for all ornamental marking, for machine or hand-sewing, whereby he does away with patterns, rules and lines. By his method the impressions are made with one or two blows of a hammer or some other hard substance of the desired shape. There is a pad made of india rubber or soft spongy leather to prevent danger of injuring the leather by hammering the marker. He also makes a channel for the stick to drop in, so that the friction of wear cannot rub the face of the stitches; which makes his method valuable in the use of light tension on the machine, doing away with all contention between marker and operator, as the lines are all perfect. One man can perform more work than three by the old method—says Mr. Rogers. Mr. Rogers sailed for the East by the last steamer, with the intention of introducing his patent there. Boot and shoe manufacturers on this coast desiring information in relation to the patent, can procure the same by addressing John F. Bughee, pier 12½ Stewart street, San Francisco.

New Quartz Screens.—The Nevada *Gazette* alludes as follows to a new description of quartz mill screens, which are now being introduced into the mills about Grass Valley: "The holes, though very fine, are about half an inch in length, and cut in such a manner that there is a space of about one-sixteenth of an inch between them. There is thus no danger of the iron between the holes breaking out, as is sometimes the case with the ordinary screen, while the new style has full as much opening for the pulverized quartz to pass through. They are cheaper than the kind in ordinary use—as the labor of punching is less—and we think they will be found an improvement. In any event, they are worth a trial."

The "Eureka Hair" Factory at Dutch Flat.—Mr. N. W. Blanchard, the superintendant of this establishment, has been in San Francisco lately, making arrangements for some new machinery, etc., the building, and all on the ground, having been burned down some time ago. Eureka hair is the interior of the California soap plant, or *amala*, with which all prospectors are familiar. It is gathered by the hands of Chinamen, packed down hill as may be most convenient,—picked, cleansed and *kinked*, so as to give a spring to it. Much ingenuity, on the part of the originator, (a young upholsterer,) and some very meritorious manufacturing enterprise, deserving of a first class medal at least, have been shown in the inaugration of this business in the foothills. The Eureka hair is said to be the best substitute for curled hair in the market, and it is sold for one-fourth the price of the latter. Last year the company worked up 300 tons of the material, employing constantly 20 to 30 men. The *amala* grows plentifully on the plains, and up to an elevation of 4,000 to 5,000 feet, Dutch Flat being 3,500 feet up. The new factory is 70x140 feet, in dimensions, 1½ story high, and it will be in operation in two weeks.

Weekly Stock Circular.

By Associated Brokers of the S F. Stock and Exchange Board

SAN FRANCISCO, April 17, 1869.

Financial.

Our local money market is very stringent; more so than at any period for years. Some of our Savings and Loans institutions have ceased loaning on any security, having only funds enough on hand to meet the possible demands of depositors, showing a healthful condition of affairs. For some time past their spare balances have been readily taken at 1¼ per cent. per month. Independent of local causes this market has been considerably influenced by the extreme pressure at the East. Gold has been in such unusual demand there that California funds have been retained in New York, and, in many cases, duplicated and triplicated remittances made to that city. Our refineries are hard at work to supply the Branch Mint, which is kept going to the full extent of the bullion offered for coining. Our quotations are as follows: Bullion is in fair supply, gold bars ranging from 890@900; silver bars remain steady from par to 1¼ per cent. premium; currency bills on Atlantic cities pay 2%@2½ per cent. premium on gold; coin drafts 1 per cent. premium. There is nothing doing in telegraphic transfers, which are quotable at 3½ per cent premium; sterling exchange, 48¾d; commercial exchange, 49¼; Mexican dollars, 6½@7¼ per cent. premium; gold in New York, April 16th, 132⅞; legal tenders with us, 76¼ @77.

We are called upon, in this issue, to chronicle the most distressing and disastrous mining event which has ever occurred on this coast. On the morning of April 7th a destructive fire broke out in the Yellow Jacket mine, Gold Hill, Nevada, and quickly communicated itself to the Kentuck and Crown Point mines, the three having subterranean communications with each other. At the present writing the conflagration still continues, but the apertures have all been closed and powerful jets of steam are steadily forced down the shafts to extinguish the flames. Thirty-seven persons are known to have perished in the mines. Nearly all the bodies have been recovered by the extraordinary efforts of as gallant and noble-hearted men as live. It is, of course, impossible now to determine the amount of injury done to these mines, which have heretofore furnished a regular monthly supply of above $250,000 worth of bullion; but we have no doubt it is very great. The heat was intense, destroying the heavy timber work, calcining the rocks, rendering it loose and friable, and causing them to cave in many places. We do not feel at liberty to make any estimates or indulge in any guesses which must necessarily be vague and unreliable, but there is no doubt a vast amount of pecuniary damage must have been suffered. We learn that it has been determined to keep the mines closed until Monday, the 19th instant. Much caution should be used in making explorations after they are opened, and sufficient time should be given for complete ventilation before persons are sent down to encounter the deadly mephitic gases, especially in the lower levels.

City Stocks.

During the past week we note sales of Spring Valley Water stock at $66 50; Omnibus Railroad at $74, and Front Street, Mission and Ocean Railroad (preferred) at $20 per share. The Omnibus Railroad Co. disbursed a dividend of ½ per cent. on the 15th inst. The last previous dividend was paid in October, 1868. The usual quarterly dividend of the California Insurance Co. ($6 per share) for the first three months of the current year, is now payable. The Directors of the company publish the following notice to stockholders: "A special meeting of the stockholders of the California Insurance Company will be holden at the office of the company, on Wednesday, May 12, 1869, at the hour of 2 o'clock P.M. The object of said meeting is to increase the capital stock of the company from $200,000 to $300,000 in United States gold coin." On the 15th instant the Fireman's Fund Insurance Company disbursed a dividend of 1 per cent., or $3 per share, for the first quarter of the present year. The California Steam Navigation announce a dividend of 1 per cent. for the past month, payable on and after the 15th.

The Bank of California paid its usual monthly dividend of 1 per cent., amounting to $50,000, on the 15th inst.

At the semi-annual meeting of the Sacramento Savings Bank, held on the evening of the 13th inst., the following statement was rendered by the Secretary, comprising the business of the institution from the date of its organization, April 18, 1867, a period of two years:

Total amount of deposits received	$1,926,066 51
Total amount of dividends re-deposited	43 144 00
Total amount of deposits repaid	885,148 58
Total amount due depositors	1,114,072 06
Total amount of loans made	1,080,120 19
Total amount of loans repaid	140,609 37
Total amount of loans outstanding	939,519 82
Total amount of interest received	53,635 82
Total amount of entrance fees received	4,372 00
Total amount in reserve fund	7,147 29
Total amount of expenses, including office fixtures, books, stationery, Federal and other taxes, fuel, light, office rent and salaries	10,475 67
Total amount invested in U. S. Bonds, which have appreciated in value since they were purchased, $2,903	41,037 00
Total amount invested in building, lot and materials	11,708 28
Cash on hand	162,547 48
Total number of depositors	2,186
Total number of borrowers	442

Mining Share Market.

The mining share market has been tolerably active during the period under review, if we take into consideration the stringency of our local money market, and the present condition of the three Gold Hill mines a Yellow Jacket, Kentuck and Crown Point—work having been totally suspended in them since the dreadful calamity by fire. As soon as practicable, however, efforts will be made to ascertain the damage done in the lower drifts, when a more steady and definite market for the stocks of those mines may be looked for. Other portions of the Comstock lode show strong indications of paying bodies of ore in their lower levels, imparting considerable strength to a number of claims. Of White Pine stocks, we note sales as follows during the past week: 75 shares Mammoth, at $10 per share; 20 Chloride Consolidated, at $15; 50 Phœnix, at $2 50@3; 200 North American, Base Range, at $5@6; 5 Featherstone, at $9. With regard to the bullion product of the White Pine region, the *News* of the 10th, says: "From carefully reported statistics we have ascertained the total production of silver of the White Pine mines, from the month of May, 1868, until the 1st of January, 1869, to be $968,813 17, and from the two mills at Shermantown, from January 1st to April 1st—the Oasis, and Moore & Barker's—$297,023 14, making a total of $1,265,836 31. Moore & Barker's mill only ran one month, and we have no returns from the two mills at Hamilton. In ten months, then, the mines of Treasure Hill have produced the large sum of upward of one million three hundred thousand dollars. This large sum, for a new district, is remarkable. What other district, within the first year of its discovery, ever produced so much? Some few gudgeons, who did not find a million in the wild-cat they bought, grumble at their loss, and lay it to the district; and also, many papers, in their inexcusable ignorance, ask, Where is the bullion, if the mines are so rich? 'The proof of the pudding,' etc. is in the reports of the facts and figures. No district but one of incomparable wealth could have furnished the amount this did in the first year of its discovery, and under the disadvantages of its situation. The report of the month of March shows a constant increase in production. Since January, we report $297,023 14, and could we add, which we will in a few days, the results from the other mills, we would have an aggregate exceeding three hundred thousand for the three winter months, of which the greatest amount would be from the last. The large shipments of bullion now made, are proof of the productiveness of our mines, and fully answer the interrogatories of the California press. Our district is sending off more bullion than any other on the Pacific coast, excepting Virginia, and bids fair to surpass even that."

CHOLLAR-POTOSI—sold within a range of $132@177, then at $187, and closed at $185. During the week ending April 9th, 890 tons of ore were extracted, 320 tons coming from the Blue Wing stope and 570 from the New Tunnel. Within the past week the New Tunnel yielded a larger quantity and a better quality than was obtained the previous week. On the 13th inst., the various faces in the stopes had better ore and more of it, and in the winze, forty feet below the track floor, a drift was run northeast, and at the above date the entire face was in fair ore. In the operations from the new shaft the ground through which they are working is reported to be softer, and they have encountered clay, quartz, etc., but no metal. Tho mills, so far, show better returns than the previous mouth.

HALE & NORCROSS—opened at $87, declined to $35, and at the close realized $90. On the 13th inst., they reached the west wall with cross-cut No. 2, running through fourteen feet of ore, and cross-cut No. 3 carried six feet of ore. The quality of the ore in this cut is reported to be good, the lowest assay showing $41 67 to the ton, and the highest $104 18. In cross-cut No. 4 they are of the opinion that they have reached the west wall, having passed through six feet of ore. This drift is now in heavy clay, which does not resemble their west wall, and the drift will be continued further west to determine the fact. They have commenced to raise up in cross-cut No. 2, and will have to raise and sink twenty-six feet to finish the connection of the winze from the fourth to the fifth level at that point. The 175 level is said to look well, and is yielding the usual quantity of ore.

GOULD & CURRY—has been more freely dealt in, rising to $130, falling to $109, and at the close selling at $112. A telegram of the 14th instant states that assays from material found in the north end of the shaft, at a depth of about 1,156 feet, give respectively $50 32, $24 87, $32 30 and $35 43 per ton, showing an average of $35 73. The whole bottom of the shaft is reported looking well.

OPHIR—declined from $34 50@31 50, and closed at $34. On the 13th inst., the drift was in a distance of 177 feet, showing no favorable change....IMPERIAL dropped from $36 to $35, and at the close sold at $32. No change in the drifts from the lower levels....SAVAGE sold quite largely at a decline, receding from $71 50 to $66 50, and closing at $68 25.

YELLOW JACKET—was quite active at $60 50@56, closing at $59.....KENTUCK was rather inactive, selling at $245@260, and at the close obtaining $254.....CROWN POINT was comparatively quiet at $59@51, closing at $54 50. These three mines are still closed, on account of the fire in the lower levels. Another attempt to explore the lower levels will be made next week. To date, thirty-seven dead bodies of miners, who were at work at the time the fire broke out, have been taken from these mines.

We herewith present a condensed tabular statement relative to the product of bullion and dividends paid by the various mines on the Comstock Lode during the first three months of 1869, together with the assessements levied during the same time.

COMPANY.	Bullion Product.	Dividends.	Assessments.
Belcher			$31,200
Bullion			25,000
Crowa Point	$ 93,130		
Confidence	18,889		
Chollar-Potosi	225,861		
Daney			36,000
Empire Mill & Mining Co.	47,619		
Gould & Curry	7,500		
Gold Hill Q. M. & M. Co.	17,701		
Hale & Norcross	60,463		
Imperial	123,689		
Kentuck	201,088	$40,000	
Occidental*	120,000	20,000	
Overman	72,170		61,000
Segregated Belcher	4,839		
Savage	524,817	168,000	
Sierra Nevada	33,026		
Yellow Jacket*	450,000	360,000	
In 1869	$2,040,885	$588,000	$156,200
In 1868	1,764,046	310,000	556,900
In 1867	2,765,531	850,000	236 780
In 1866	2,291,883	90,000	474,600

* Estimated.

THE new "California Stock Exchange" board has been fully organized, and the Bank Exchange billiard room is being fitted up for their use. The officers are S. Heydenfeldt, President; T. C. Sanborn, Caller, and W. V. Wells, Secretary. All the current mining stocks will be dealt in, but it is understood that the specialities will be the best known mining properties of White Pine. There are 80 members.

VISITORS in the city wishing spectacles, mathematical or optical instruments, will do well to call at Muller's Emporium, 205 Montgomery street. *

TAX RATES.—The rate of city and county taxes for San Francisco, for the coming fiscal year, have been fixed by the Board of Supervisors as follows: Rate of local tax $2.11½, State tax 97 cents; total for State, county and municipal, $3.08½ on each $100 of assessed valuation. The rate of taxation for the past four years has been as follows, beginning with 1865-6: $3.12; $3.10; $3.00; $3.05; coming year $3.08½. The State tax has been decreased in that time from $1.15 to 97 cents; while the city and county tax has been increased from $1.97 to $2.11½. A careful analysis of the apportionments of the city tax for the coming and ensuing year, as given in the *Bulletin*, shows that the tendency is to an increase of general expenses in a ratio greater than the increase of property values. This fact, taken in connection with the rapid increase in the value of real estate, and of wealth generally, in this city, makes a poor showing for the management of our municipal affairs.

FIFTY POUNDS OF NITRO-GLYCERINE.—The Titusville (Pa.) *Herald* says that the above quantity of this article was exploded in a single blast at one of the oil wells recently. The operation was a success.

THE INVENTOR'S AND MANUFACTURER'S GUIDE.—This is another New York inventor's journal, which comes to us enlarged and filled with interesting matter. It is published by Saltiel & Co., No. 37 Park Row.

LEXINGTON, April 3, 1869.

DEAR SIRS—The Letters Patent have just come to hand. For the prompt and business-like manner with which you have put the matter through, please accept my thanks. GEO. W. TEASDALE.

To DEWEY & Co., Publishers M. & S. Press.

THE PRESS is one of the most valuable and instructive papers published in the United States, and every miner, millman, machinist and foundryman should be a subscriber. The information to be derived from its columns is worth many fold times the subscription.—*Grass Valley National.*

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

From the *Chronicle*, April 3d:

The Pennsylvania.—The Peunsylvanians have been drifting alongside of their ledge, and have run in about 15 feet on both sides of the tunnel. The ledge appears to be widening and becoming more solid, and the ore is improving at every step.

Miner, April 3d:

Globe.—The mail brings uews of the success of Mr. Winchester in procuring means to prosecnte the work. Judge Clark, Superintendent, took an average sample of a feeder from the main lode, cut some distance back in the tunnel, and procured an assay resulting in $26.46 per ton. At the same time assays of ore selected from a tunnel went over $250 per ton.

AMADOR COUNTY.

Ledger, April 10th:

The Casco Mine.—The new hoisting works are now in operation. The new engine is a most excellent one, and the other machinery of the most substantial character.

Eureka.—For March, the Eureka mine, owned by the Amador Mining Co., at Sutter Creek, cleaned up a little over $64,000.

Coney & Bigelow.—The new shaft is now down nearly 50 feet, and tho rock is looking splendid. Work is being vigorously prosecuted.

Hinckley Mine.—Work has been commenced again. Heretofore, some very rich rock has been taken from this shaft.

CALAVERAS COUNTY.

Chronicle, April 10th:

Railroad Flat.—Since the sale of a half interest in the Petticoat, the utmost energy has been evinced in operations upon the mine. The new shaft has been sunk to the bottom of the old level, a distance of 100 ft., and will be continued to twice that. Ore is being extracted, keeping the mill constantly employed....Chapman, Hopper & Co. at 30 ft. found water in such abundance as to prevent further developments without the aid of machinery. As the ore taken from the prospect shaft paid $50 per ton, they commenced at the water level and are stoping out the entire lead to the surface. They now have out 160 tons of rock. It is the intention to erect machinery as soon as the rock in sight is crushed.... Sauderson, Gay & Co. are taking out ore which prospects exceedingly well. Their previous crushing yielded at the rate of $57 per ton, unassorted. The lead is narrow, but well defined....The Lewis Brothers, on Wet Gulch, have reached the water level and been compelled to suspend operations in their shaft. They have commenced a tunnel which will tap the vein at a depth of 150 ft....Gamble & Co. are urging operations with cheering prospects....The Balmoral and Chemisette are dormant.... Smart's mill will commence crushing within a few days.

Lower Rich Gulch.—The extensive hoisting in process of erection upon the Palomo mine, will be completed in about six weeks. Work is being pushed rapidly, and by the time the machinery arrives the buildings will be in readiness.

San Andreas correspondence of same:

Pioneer.—This company have 100 tons of rock out which will yield from $10 to $20 per ton. Thorn & Co. contemplate putting a 10-stamp mill on this mine to be run by water power.

Whisky Slide ditto: Things are going slowly here. Water is scarce; miners can only work part of the time. Some are doing well, others only making a living. Mr. Harper cleared $10 per day for the actual labor done on his claim at Wet Gulch; Jameson & Co., on Whisky Slide Gulch, work two hours per day, and realize small wages. The Soger Co., on Horse Power Gulch, have been making an average of $7 per day. The majority of the miners will ground sluice as long as the water holds out, and not lose time in cleaning up.

EL DORADO COUNTY.

Placerville *Democrat*, April 10th:

Reservoir Hill.—We have mentioned the sale of Judge Freyer's claim for $3,600. On the 6th inst. a two third interest in the same claim was sold to Slater & Hancock for $4,200.

Georgetown.—A correspondent sends us the following: Halls, Beebe & Co., of Jones' Hill, five miles from Georgetown, with a 5-stamp mill, in three weeks have taken out over $5,000. The Eureka, owned by Keefer & Co., will soon put up an 8-stamp mill. They have plenty of rock that prospects well. A. T. Wilton, of Mt. Gregory, picked up a piece the other day worth about $100, free gold. Mines are on the improve, with flattering prospects.

INYO COUNTY.

Los Angeles *News*, April 3d:

Lone Pine.—The Union mine, at a depth of 300 feet, has developed a lode 20 feet wide, of argentiferous galena, which yields $160 of pure silver per ton. The mill of Louis Wolfskill, of this city, which is to have five stamps, will be in running order by the 10th day of June, and have a crushing capacity of 15 tons daily. The Belcher mill is now crushing ore that yields about $500 in silver every 24 hours.

In the Cerro Gordo mines proper there are about 400 miners at work, all of whom appear to be well pleased with their prospects.

Mr. L. Laskie, of this city, who owns 1,000 feet in the San Bonita mine in Lone Pine District, has permitted us to make the following extract from a letter recently received by him:

"Enclosed I send the silver that I got out of twelve ounces of the San Bonita rock. All the lodes that have had work done on them since you left, improve as they go down, so I think you had better return as soon as you can. I had an assay of the Queen City rock made by Mr. Elder; it assayed $316 per ton, and is still getting better."

Mr. L. exhibited to us a piece of silver as large as a bullet, that came from twelve ounces of rock taken from the San Bonita lode, sixty feet from the surface, where the lode shows a width of four feet, and proves by assay to contain $2,140 to the ton. The Queen City, a short distance from the former, has a lode four feet three inches wide.

KERN COUNTY.

Havilah *Courier*, April 6th: The McKeadney mill is hammering away....The St John mine, at Sageland, owned by Thomas Walker and others, is in blast again. It pays as well as ever.

LOS ANGELES COUNTY.

News, April 3d:

Soledad.—By the arrival of stage from Soledad, we were the recipient of some ore from the new discovery of Dr. Columbo, made about two or three weeks ago. This ore is gold and extremely rich, the vein being about four feet wide, with well-defined casings.

NEVADA COUNTY.

Transcript, April 8th:

Rich Strike.—An old miner yesterday brought into town a specimen of quartz weighing three pounds, containing about $25 in fine gold. It was obtained from a ledge in this township, the location of which he refused to give.

Same of 9th:

Deer Creek.—A company of men are washing away the site of the Old Eagle sawmill on Deer Creek.

Same of 10th:

Little York.—The Little York Hydraulic Mining Co. are taking out, after every 10 days' run, from $3,000 to $4,000. Last month they cleaned a little over $10,000. At other places in Little York township the miners are doing well.

Gazette, April 6th:

Hunt's Hill.—Tucker & Williams, are doing a heavy hydraulic business, and also the McLeod Co. adjoining. The former company employ 10 men, and the latter six.

Quaker Hill.—Jacobs & Sargent are running their extensive hydraulic claims every day, having adopted the Monitor pipes, and are using 650 inches of water. The claims are paying on an average $300 a day with 14 men.

Sale of Claims.—John C. Cookerly has sold one-half of the claims on Woolsey Cañon, near Moore's Flat, to John Caldwell for $3,250.

Same of 7th:

There is a good demand for laboring men at $3 a day, gold coin. Good miners, who understand drifting and working hydraulic claims, can get steady work at Scott's Flat. Quaker Hill, Hunt's Hill and Gougeye. Fifty good men are wanted.

Same of 10th:

Red Diamond.—Oscar Maltman, who recently examined the Red Diamond claims, states that the surface of the entire claims will pay a good profit for hydraulicing, and that all the ground within ten feet of the bedrock will pay well for drifting and milling. As soon as the surface is worked off, the company will build a mill. From a pan of gravel 10 ft. from the bedrock Mr. M. realized $3.75. Strauahan, on Barrington Hill, near the above claims, cleaned up last week, from eight days' run, $1,300. The Stevens claims, on the opposite side of the ridge, are being worked with good results. The mining prospects from Scott's Flat to the Cascades are better than they have been before.

Grass Valley *Union*, April 4th:

Union Hill.—This mine is improving daily in appearance, in the new shaft. The clean up for last month was $6,000.

Same of 7th:

The Idaho.—The Idaho Mining Co. declare dividends on the first Monday of each month. For March the receipts in free gold, not including any from sulphurets, amounted to $30,428.35. For the month the company declared a dividend of $15,500 and carried over a surplus of $14,200.

Eureka.—Yesterday the mine made a shipment of $23,000 worth of gold bars. This was the result of two week's run, and is exclusive of gold contained in sulphurets. Taking the free gold yield and the sulphurets gold together, the two weeks' run shows about $30,000.

Same of 9th:

Harterey.—This mine, on Wolfe Creek, north of Allison Ranch, is being worked by John Ford & Co. under a lease. We yesterday saw a nice lot of gold just cleaned up. The value is about $3,000, the proceeds from 115 tons of rock.

William Penn.—This mine is now yielding excellent rock—recent crushings having paid as high as $60 per load.

Young Pines.—The Young Pines mine joins the Wm. Penn. Very fine quartz has been found on the croppings, and the company will commence taking out rock as soon as the rains are over.

Grass Valley *National*, April 6th:

North Star.—We are informed by J. H. Crossman, the Superintendent, that on Thursday the company will commence putting in their new 16-inch pump.

Howard Hill.—The Lucky mine, on Howard Hill, cleaned up yesterday $2,400, the result of eight days run with 10 stamps.

Jone's Bar.—Fogarty & Co. have purchased the 10-stamp mill of J. J. Collins, of Brown's Hill, and are moving it to Jones' Bar. The cement, which prospects well, lies in the bed of the river and is covered with five feet of tailings. The pay streak is from one to ten feet in thickness.

Black & Young have purchased one-half of the celebrated Barbary mine, at Eureka.

Same of 8th:

Empire Co.—The Empire Co. started work on Monday on the Rich Hill ledge, 1,500 ft. east of the present shaft of the Empire. They are cleaning out the old tunnel, and intend to sink a shaft, put up a pumping engine, and erect hoisting works.

PLUMAS COUNTY.

Quincy *National*, April 3d:

Mill Creek.—The miners are all busy at work, have plenty of water, and are doing well.

East Branch.—A gentleman informs us that the miners in that vicinity are all busy at work and have an abundance of water for mining purposes, but have made no clean-ups yet.

La Porte *Union*, April 3d: J. P. Denoon, in the Redding claims near the line of the Gem Co's ground at Gibsonville, has struck rich pay dirt. The Gem has not been worked for several years, and Denoon has purchased the claims for $1,000.

A company was organized in this town a few days since for the purpose of opening a set of claims in Bald Mountain. This company means business. Work will be commenced immediately.

SIERRA COUNTY.

Downieville *Messenger*, April 3d: The Fir Cap Co. last week struck rich pay. Messrs. Alleman and Burgess exhibited 28 ounces of gold taken from about five car loads of gravel, bedrock, etc. The largest, a piece of pure gold, weighed eight ounces.

SISKIYOU COUNTY.

Yreka *Union*, April 3d:

Brady & Co.—Brady & Smith have struck a stratum of cement in their claims, in the northwest suburb of Yreka, that is just "lousy" with gold.

Large Nugget.—Robert Pitt took from his claim on Portuguese Flat, recently, a nugget worth $300.

Lash & Co., of Humbug, commenced this week to crush a lot of rock from the Knapp ledge.

Cottonwood.—Frank Merritt and others own a quartz ledge near Cottonwood, which they are about to commence to prospect again. The ledge is about three feet in thickness, and gold can be seen with the naked eye in quartz from any part of it.

SHASTA COUNTY.

Courier, April 10th:

Fine Specimen.—Last Saturday, John Wilson exhibited a piece of gold weighing $75, found in his claim on Salt Creek.

Rich.—Blair & Banghart, after working four days in their newly-discovered claim on Brandy Creek, cleaned up twenty ounces of gold.

SONOMA COUNTY.

Petaluma *Journal and Argus*, April 8th:

Sonoma Mines.—The numerous claims are being diligently prospected, but the result has not shown any well-defined ledge. Some of the croppings show unmistakable signs of silver, but we must see more decided evidence before we pronounce the district rich in precious metal.

Since writing the above we are informed that the Buckeye, or Davis Co. have organized, have purchased mining tools, have broken ground for a shaft and tunnel, and intend pushing the work forward as rapidly as possible. Nature has already sunk a shaft to the depth of 100 feet. The ledge is over 40 feet wide, and nearly exposed by the action of the water. The casings on the north side of the ledge can be distinctly seen.

TUOLUMNE COUNTY.

The Golden Rule Co. have declared a dividend of 50 cents per share, aggregating $1,500. The ore has averaged from $5 to $10 per ton, and yet the company have run a tunnel 500 feet, erected a 15-stamp mill at a cost of $22,000, and accumulated a reserve fund of $13,000 in bank. New hoisting works are now being erected, and general repairs being made.

TRINITY COUNTY.

Journal, April 10th:

Sale of Mining Claim.—We are informed that last week B. Murphy sold his mining claim on Evan's Bar, to P McGrath, for the sum of $2,000.

Letter from "Pest House:" "McGillivray's ditch is full of water, night and day, and every drop in use. H. C. Wilt says his claim will pay better than last season, and then it was admitted to be the best claim in this section. He has not cleaned up yet. Below him, on the same bar, Brown & Barber are opening a new claim with fair prospects. The claim in which I am at work (the Humbug) is on Portuguese Flat. We have not done enough work as yet, to know how our diggings will pay. The Blow-hard claim, on Gas Point, is all that it has been represented—a run of eleven days paying $600. From what I hear there is not one claim in the Red Hill country but what is yielding largely."

YUBA COUNTY.

Appeal, April 13th:

The Pennsylvania.—This company has got its new 12-inch pump in place, and expects to commence crushing to-morrow. We are told that the mine now presents a flattering aspect. The stamps were in operation eight days in the month of March, and about $1,800 was the result.

COLORADO.

Central City *Herald*, March 31st:

Mill City.—The deepest shaft on the Young America is in poor ore, but the miners think the vein is improving in character In the vicinity of the Young America Mr. Cook has got a good lode which he has named the Capital. The crevice is three feet wide, and has a vein of quartz sulphurets and galena nearly as wide as the crevice. The galena is remarkably pure. Prof. Stewart has found it to contain 40 per cent. of lead. Select specimens assay as high as $700 per ton....Mr. Snyder has returned from the East. He kept two arastras running pretty constantly last summer, on ore from the Culbro lode, which yielded enough gold to pay all his mining expenses of the past summer.

Trail Creek.—Judge Colvin, agent for the Freeland Co., proposes to mine on the Freeland lode, and will use stamps and pans in treating the ore.

Hukell Gulch.—J. W. Thackaray, agent of the Fairmount G. M. Co., is going to work. He will use arastras.

Denver *News*, March 31st: We saw at the express office last evening a monster silver button, boxed and prepared for shipment to the East. Its length and width was about two feet by three, weight 535 pounds, troy, and value in currency $10,200. It was from the works of the Brown S. M. Co., the result of about 2½ weeks' run.

Georgetown *Miner*, March 25th: The building for the crushing and dressing works is being completed as rapidly as circumstances will permit. The machinery is on the route here, and will probably arrive by the time the building is ready.

Stewart has his amalgamating works in operation, and plenty of ore on hand. He is testing the same ore both by raw amalgamation and chloridizing.

We learn that several very fine lodes have been recently discovered on Sherman Mountain, below the Snowdrift.

A lot of Mendota ore is being taken to Stewart's works for smelting.

The mineral vein in the Chit lode has increased to six inches in width.

IDAHO.

Owyhee *Avalanche* April 3d:

Ida Ellmore.—This mill started up on

Thursday. The mill has never been in as good running conditiou, and the mine has never looked so well.

Silver City *Tidal Wave* April 2d:

Walsh & Warnker are making a good run of Astor ore in Black's mill, at Flint. The yield, as we are informed, is over $200 per ton.

The Golden Chariot mine, a short time since, was giving evidence of improvement in the 250 foot level. We now have the assurance that it has more than realized its most extravagant indications, the ledge is not only wider, but richer in the south drift than at any point yet explored. The workmen in the Ida Ellmore give similar encouraging accounts of the prospects of that mine.

Prof. Ashburner's recent report on the Golden Chariot mine is published in the same journal. The conclusion is as follows: "To conclude, therefore, I would give it as my opinion, that this property possesses great present and prospective value. That there are in sight, and thoroughly developed, about 1,200 tons of ore between the first and second levels, which it appears safe to assume will yield an average of $150 per ton, or $180,000. That between the second and third levels, the vein is developed on two sides, and partially on the third, by the shafts and drifts, and that so far as explored, there appears every indication that this portion of the mine will furnish at least 4,000 tons of ore, the average value of which there is now no reason to suppose will prove less than that taken from above."

The Boise City *Statesman* says: There is a scarcity of miners in Alturas County. The Wide West and other good paying mines are idle for want of men to take out the quartz. The Monarch Co. have bought the Farnham mill. South Boise is exhibiting some superior specimens in Boise City.

Salmon River Mines.—Leesburg correspondence of Montana *Post:* At the head of Nappias Creek, Mulky, Henady & Co. have a horse whim erected for hoisting gravel, and are doing a good business. Next below them Sanborn & Co. are drifting, hoisting, preparing sluices, drains, etc. Discovery Co's ground immediately below, which paid such handsome profits last year, will be worked by the same company this season. They have also two bars in other localities, which they will continue to work. It is a strong company and well managed. Below are the famous Douglass claims, which have paid well for two seasons and have as good promise for the future. These claims are near the mouth of Smith's Gulch. Heatle's flume, some distance down the creek, is ready for operation. Four miles below Leeshurg is Beers, Davis & Co's flume—an extensive affair. The work was done last winter, and the flume cost some $25,000 or $30,000. It is now ready for operation. All the indications are favorable.

MONTANA.

Helena *Post*, March 26th:

Silver Star.—We learn that there is great excitement in regard to the quartz prospects. The unprecedented success of the Green-Campbell and Stevens & Trevitt's mills, has aroused people. Every one owning quartz instead of being anxious to sell, experiences a desire to prospect, and developments are being made to a great extent.

Cave Gulch.—In this camp we learn that drifting has been going on all winter with very favorable results. Marshall's ditch, which conducts water from Magpie Gulch, will be open in about three weeks, and mining will then commence for the season in earnest.

Deer Lodge.—Charles Hendrie and Dr. Ray have commenced operations at Butte City. They are building a smelter, crusher and roaster, all of which they expect to have running within thirty days. Among other leads which they propose to work upon is the Gem. The prospects for placer mining on the Butte the coming season are flattering. It is expected there will be upwards of 500 men employed. In Gold Creek some new diggings have been discovered, which promise to be very rich.... Another rich and extensive discovery has been made in the Gold Creek region, at the head of Squaw Gulch. The pay ranges from 20 to 40 feet in depth, and pays from the grass roots down. Water will be used to work this ground from the Rock Creek ditch, and they will be mined by hydraulics.

Lincoln Gulch. — During the past winter considerable work has been done at the lower end. From present indications it will yield abundantly. The extent of pay ground is not large, but it is very rich.

Public Spirited.—Travis Bros., appreciating the energy and untiring perseverance of Capt. Robert Parkinson in developing his lode at Unionville, in the face of many obstacles, manifested that appreciation by presenting him with a handsome carriage valued at $550, and they agree to present to any man who during the present year shall develop a lode to the same extent as Mr. Parkinson has to the present time, a team worth $1,000.

Virginia City Items.—From the *Democrat* we learn that sluicing has commenced in Alder Gulch....At Nevada City the season is a month earlier than usual....A specimen of quartz from a new district called Silver Belt, shows it to be very rich. ....It is said that the Cork Co. will lease the ditch from E. Croighton & Co. this season. This ditch supplies water to Alder Gulch.

NEVADA.

PAHRANAGAT.

Austin *Riveille* April 8th:

We learned yesterday from Mr. Frank Clugage, who just returned from Pahranagat, that work was nearly stopped in that district for want of hands. Two companies were in want of miners, but they could not obtain them, so great was the rush to White Pine. Wages for miners was $6.50 in currency per day. On his way in Mr. Clugage stopped at Graut and Troy districts, where all was life and activity. In the former there was a considerable body of men at work in opening claims or prospecting.

REESE RIVER.

Austin *Reveille* April 3d:

Lander Hill.—Several of the mines are producing ore, both chloride and sulphurets, of unsurpassed excellence, and in considerable quantities. Lane and Fuller has developed a massive body of noble silver ore of the sulphuret variety. A liberal proportion of this ore will yield in the mill from $500 to $600 per ton; while the second class, of which the tons already extracted will number hundreds, will give from $150 to $200 per ton. In the works of the Manhattan Co. fine ore has been disclosed in mass at several points. The Florida is producing very valuable ore; and the ore in the Harding and Dickman is not at all inferior to that produced in its earlier days.

Same, of 6th:

The Manhattan mill would have been opened two weeks earlier but for the difficulty of procuring experieuced hands. White Pine is the great maelstrom which has drawn to its center the people of contiguous and remote districts. This is a fact, and a sufficient explanation of the closing of works in Silver Bend.

Same, of 7th:

As announced, the Manbattan was reopened this morning with the thunderiug chorus of its full battery of 20 stamps. The sound is cheering. There is a large supply of ore of a very high grade at the mill.

Same, of 8th:

Butte Mountain.—Miners and prospectors are busy. The Little Giant continues to produce large quantities of superior ore. The second class of this, about three-fourths of the whole, assays about $300 to the ton. The Atchison mill, where the ore is reduced, saves only a moderate proportion of the silver. There is no timber contiguous to the mill, and sage brush is the only fuel used. On or in the vicinity of Long Creek, there are 15 other ledges which produce excellent silver ore, some of which have many tons waiting reduction.

Belmont *Champion*, April 3d:

Peoria District.—A mining district, situated northwest of Reveille district, has been organized and called Peoria. The result of seven assays of the ore is given, the highest of which is $675, and the lowest $125 per ton.

Reveille.—A gentleman just in from Reveille informs us that the prospects were never so bright as at the present time. The population of the district is increasing daily, and the work of prospecting and opening the mines is being prosecuted vigorously.

Silver Peak.—We learn that, owing to the scarcity of laborers, the mill of the Silver Peak and Red Mountain Co. is able to run but half the time.

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

The Gold Hill *News*, of April 10th, says: "All yesterday afternoon and last night the shafts of the Yellow Jacket, Kentuck and Crown Point have been closed tightly as possible, to the exclusion of fresh air from the surface; and from the boilers of the hoisting works of all three mines, a strong volume of steam has continually been pouring down each shaft. Through the large blower tube of the Yellow Jacket and Crown Point shafts the steam passes to the lower levels of each mine, and down the Kentuck it is forced nearly 100 feet, through heavy iron pipes thrust down for the purpose."

Flags at Half-Mast.—The flags on the various mining works and engine houses throughout Gold Hill and Virginia have been at half-mast ever since last Wednesday.

After the injection of steam as above described had been kept up sufficiently long to insure the complete extinguishment of the fire, in the opinion of those best capable of judging, the shafts were opened. But it was found that the fire was yet burning; and after the recovery of two more bodies, the shafts were again closed. The injection of steam was renewed, and is still going on. The shafts will probably remain closed during the remainder of the week. The damage to the mines is believed to be, upon the whole, not very great.

Virginia *Enterprise*, April 6th:

Occidental.—Yesterday (Monday) this company struck into some very good ore at the bottom of the winze they have been sinking from their present lower level. The winze is 140 feet deep, and the ore was encountered 30 feet below the lower level. It will probably work about $50, though assays run as high as $150 and $200. The Co. sent to Gold Hill for melting and assay, about 350 pounds of crude bullion, of the estimated value of $10,000. We understand that the trustees of the Co. have decided to declare no more dividends at present. They are satisfied that their lower tunnel will tap the lead much sooner than was anticipated, and, instead of giving dividends, will retain the cash in the treasury, for the purpose of building a large mill at the mouth of the tunnel as soon as the vein has been cut.

Nevada Mill.—A new engine is being put up in the Nevada mill. The old one was not of sufficient power to do the work required.

Sierra Nevada.—The necessary repairs to the boiler and other machinery of the Sierra Nevada will have been completed, and it will start up again this morning, about 9 o'clock. The Co. have on hand an abundance of excellent ore.

Same, April 9th:

Dividend Recinded.—The Yellow Jacket dividend of $5 per share, payable on the 14th, has been recinded. It is doubtless intended to use the surplus funds of the Co. in re-timbering the mine, and repairing the damages caused by the recent fire.

Same of 10th:

Gould & Curry.—The Gould & Curry Co. are finding some very fair quartz in the bottom of their shaft. The pay occurs in bunches, and the best ore assays nearly $70. The indications are very favorable.

Bullion Shipment.—During the past week Wells, Fargo & Co. have shipped from their office, in this city, 7,180 pounds of bullion, worth $193,538 71, and the Pacific Union shipped 2,150 pounds, worth $55,721 42, making the total shipment for the week 9,330 pounds, worth $249,260 13.

WYOMING.

Sweetwater Mines, Feb. 24th: Work is progressing on the Mary Ellen, Calhoun and Gold Hunter ledges. The quartz from all three prospects from $75 to $100 per ton. ....P. Walsh informs us that his shaft on the Morning Star ledge is down 30 ft. exhibiting a 3-ft. crevice....Lem. Colbath had arrived at water level with his shaft, and the St. Lawrenco continued to hold its richness and size....Boyd and Sickler are busy at work on Cariso Hill, sinking a shaft on the Young America extension....Geo. Dixon is diving into the Nelly Morgan ledge as fast as powder and pick will carry him....An ounce per day is being taken out of Rock Creek by the rocker process. ...The last run of the Miner's Delight rock milled over $120 per ton....Claims are being prospected on Hermit Creek.... A company has been organized to develop Willow Creek....Fairfield and Smith have just started their shaft on the Norfolk.... Theall and Snider, on the Empire lode, are now at the depth of 22 ft., and their ledge is very rich....A rich ledge was discovered late in the winter, California district, half a mile below Atlantic City, and called the Golden Leaf. It assays—miners' process, hand mortar and horn—$263 per ton, a little over 13 cents per pound....Mr. Grace has taken out 500 tons of excellent ore from the Reedell claim, Cariso ledge, Robert's claim is being worked during the winter. Work will be resumed on all the Cariso claims in a short time.

Same of March 3d: Sage Miller and party are constructing an arastra below the mouth of Slate Creek on rock, for working ore from the eastern end of the Cariboo. Peas & Co. worked rock last summer from the western end by the same process, which paid $55 per ton....Morris, Moliter & Co. have driven their shaft of 22 ft. on the Garden City....The Miners' Delight rock is turning out over $150 per ton. In four days' run, $4,800 was taken off of the plates alone....Ramsey & Stark, of the Duncan ledge, have a shaft down 15 ft. with a 3 ft. crevice. Chris. Smith on the Barbary, has a shaft down about the same depth.

Minerva.—Erwin & Co. have a shaft down some 15 feet, and a crevice of 16 inches.

Same of 14th: We paid a visit to the Cariso ledge a few days since. On the dump is to be seen between 600 and 700 tons of the finest quality of ore, for easy milling, to be found in this or any other country, and of extraordinary richness. We were permitted to carry away our pockets and arms full of specimens, sticking full of gold. On Reedell's claim the ledge has a width of from 10 to 15 ft. along the drift.

Diamonds at the Cape of Good Hope. Mr. H. Emanuel, a resident of the Cape, has sent a suitable man to explore the reported diamond region,—in order that he might contradict or confirm the stories which have been set afloat upon the subject. This person "failed to find anywhere those geological and mineralogical signs which have hitherto been invariably seen wherever diamonds have been found, and nowhere does the formation of the country warrant the inference that diamonds could exist there. He is of opinion that no diamonds have nor ever will be found in the Cape Colony—saving such as are there deposited for a purpose; and he fully believes that all the reports that have been so industriously circulated on this subject and about gold fields owe their origin solely to interested parties who aim at enhancing the price of land and attracting a flow of immigration."

Japanese Dentists.—Dr. Alexander M. Vedder, for some time resident in Japan, in the *American Journal of Medical Science* for January, says: "The extraction of a tooth is regarded by the Japanese as a capital operation; and not without reason, if the information given me be reliable, that death (from tetanus, I presume) is not unfrequently the result. The tooth is extracted by the operator's fingers, but not until it has been well loosened by means of a stick and a mallet vigorously wielded. The operation is seldom performed; but I saw some teeth in the possession of these charlatans that had large portions of the alveolar process attached. In the face of these facts it can scarcely be credited that artificial teeth, sustained by *atmospheric pressure*, have been in use from time immemorial. These teeth are carved out of sea-horse ivory."

Something More than a Toy.—Now that the irrepressible Yankee has got hold of the velocipede, he is not likely to let go of it until he has perfected it. He will make "something useful" out of it, for it has "possibilities." The papers are full of descriptions of new improvements upon it. We see that a Detroit man has made one which has been run a mile in two minutes and a quarter, upon a common road. We are quite prepared to learn that some genius has leaped his four-wheeled machine upon the rail track in front of an approaching locomotive, and, with thumb to nose and fingers impudently gyrating, has bid defiance to the engine driver, challenging him to catch him if he can!

The Darien Canal Business is still in a muddle, although its friends continue to think that it will come out all right, so far as governmental negotiations are concerned. In the meantime a resolution has been offered in Congress to authorize the President to appoint a commission "to examine into the practicability and best method of establishing a ship canal at the Isthmus of Darien."

The St. Louis Artesian Well is now down something over 3,000 feet, and still going down at the rate of about three feet a day. This rate of descent has been kept up for over two years. We are not informed as to the depth at which they expect to find water. This well is being sunk at the expense of the county.

San Francisco:
Saturday Morning, April 17, 1869

Notices to Correspondents.

S. P.—Antbelia is the name given to the pbenomena you allude to, and, according to Sir J. Emerson Tennent, is frequently to be seen in Ceylon in great beauty at early morning, when the light happens to be intense and shadows consequently are proportiouably dark. On such occasions when the sun is near the horizon, and the shadow of a person walking is thrown on the *dewy* grass, each particle of dew furnishes a double reflection; one from its concave and a second from its convex surface. From these causes the spectator perceives his figure, but more particularly the head, surrounded by a halo as vivid as though it were radiated from diamonds. Scoresby has described a similar occurrence as taking place in the Arctic Seas, when fogs rest upon calm water. Something similar has also been witnessed in India in the Khasia Hills, and by Vigue in Cashmere. Remond mentions a still more striking phenomenon as being occasionally observed in the Pyrenees, viz: that of the reflection of the human body with a halo round it, on the surface of a cloud, lying level with the spectator.

Interesting contributions for our cabinet have been received from Dr. L. G. Yates, of Alemada; from W. F. Stewart, of San José; Henry Kohlong, of Napa, and J. H. C. Bennett, of Santa Clara.

The Giant Powder is now undergoing a pretty thorough practical trial in the quartz mines at Grass Valley. The *Union* says it has been employed over a month in the Empire mine, where it is regarded with much favor by the superintendent, Captain Lee, and by the men who are using it. Whatever doubts or prejudices existed previous to its introduction there, have now been quite effectually dispelled, even to the serious question of injury to health from the fumes of its explosion. The great saving in its use is found in the fact that a three-quarter inch hole, which can be drilled by one man, when charged with this powder, will do more execution than an inch and a quarter hole, which must be drilled slower and with two men, can do when charged with ordinary powder. The North Star mine and the Eureka mine have also commenced experimenting with this powder. Mr. Watt, the superintendent of the latter mine, is determined to give it a practical trial, and become thoroughly convinced of its merits or demerits. His opinion will doubtless have much influence with miners throughout the State.

Wooden Hams.—The Chinese made wooden hams, covered with hogskin and smoked, five hundred years before a Yankee was ever thought of.

San Francisco Manufacturing Notes.

A ride to the suburbs on any of the railroad routes of San Francisco, discloses unexpectedly to the observer so great a number of new manufacturing establishments, that it is beginning to be quite impossible for even an old citizen to keep the track of them, otherwise than by devoting several days or weeks especially to the business. Many of these manufacturing processes are of great interest and importance to the State; all their doings are certainly of interest to the capitalists and specialists who thus occupy vacant fields, and derive splendid and permanently flowing profits from them, or who in consequence of their own miscalculations, lose. We shall refer to some of the salient points, at random, as our attention may be directed to particular establishments in our excursions. Manufacturing is especially active around Mission Bay. There are several score at least of smoking chimneys or high walled manufacturing enclosures to be met with on a walk, the object and detailed operations of which reach the cognizance of the public only over the tradesman's counter.

Another favorite locality is along the roads or the water between North Beach and Fort Point. The variety is too great to admit of specification in classes. In general it may be stated that about everything can now be manufactured here to profit, that is done in the Eastern States, only that is under modified circumstances. Very many of the establishments are small, or temporary looking—of redwood boards—but none the less promising on that account.

Samuel's Wood Preserving Establishment,

which has been noticed in the papers, is one of those which does not appear to have fairly commenced in its career of boped-for success, though there are large heaps of Nicholson pavement blocks that have been treated by it, lying in the vicinity of the works on Berry street, between Third and Fourth. It has a collossal iron cylinder extending from the wharf's edge through a small redwood engine building, to the loading place for wagons in the rear; the dimensions being seventy-four feet in length and four feet in diameter, and a railroad track running through its entire length for trucks to carry in and out the timber to be treated. A 15-horse power engine first exhausts the air, then forces the solution sulphate of iron and lime out of the tanks into the cylinder, to a pressure of 130 pounds to the square inch. This is kept up from three to eight hours, according to the kind of timber. One set of cars admits of curing 12,000 feet of lumber in twelve hours; two sets nearly double the quantity. The charges are about $8 per thousand feet, or one-fourth the price of the wood. Piles exposed to the attacks of borers, and wood in general liable to rot, is preserved, according to the representations, for fifty years. Mr. Gray is the Superintendent.

Asphaltum Drain Pipe Factory.

On Berry street, between Second and Third, there is a new drain pipe factory, which has been started by Mr. Christian Wise. This article is very superior for acid and alkaline waters, lasting indefinitely, at the same time that it is the cheapest in the market except common clay pipe. It is made of San Bernardino asphaltum, clay, and lime saturated with the impurities of coal gas, from the gas works. These are ground fine, mixed in melted asphaltum, and worked into pipe of 6, 8, and 12 inches diameter, in upright molds of the kind invented by Mr. Carlyle, of the Golden State Iron Works; a revolving weight packing the matter in firmly as it is fed, and a jet of water from below cooling it off. The asphaltum used costs $16 a ton, and contains about 20 per cent. of oil. Where there is no great pressure or head of water, asphaltum pipe is excellent. It is used for sewers and salt water drains especially, where iron would corrode, and cement pipe would soften.

A joint of pipe three feet in length is made in about five minutes. Mr. Richard Gaines, the foreman, has invented a new machine, however, by the use of which the same can be done in one minute; steam pressure and suitable cylinders being the agency employed,

A New Crushing and Grinding Mill,

on a principle entirely original, is employed at this establishment, the invention of Mr. John Doherty, a poor and decrepid old shoemaker, who hit upon the idea while lying disabled upon his couch in the hospital. It is highly spoken of by the foreman as performing successfully the functions both of a crusher and grinder, and as possessing the merit of being remarkably cheap, and requiring little power. It is very simple. There is a stationary disk, thick and indented on one side, and a revolving one, similarly indented so as to open a space between it and the stationary one. As the movable one revolves, this opening gradually closes, and grinds up the rock, reöpening and closing in succession. Blocks of granite the size of a fist were instantaneously reduced to powder. The cost is $100 or less, while any other machine to do the work would cost the factory $400 or $500. An old coffee mill grinder has been discarded as worthless. Doherty thinks that his mill will do the work of a 10-stamp quartz mill. It is estimated to crush a ton an hour, and is intended to work wet as well as dry.

Improvements and Developments,

along the newly piled and leveled water front beyond Rincon Hill, are rife at every hand. Pope & Talbot have opened a lumber yard at the foot of Third street. The Napa and the San Francisco Wood and Fuel companies occupy wharves, and are running steam cutting and splitting machinery, both doing an active and growing business. Granite stone yards occupy many vacant lots. The Pacific Linseed Oil and Lead Works are finely "fixed" for a career of prosperity, the buildings being substantial, of brick, and ample. The linseed oil of the market is refined, and metallic lead is transformed into carbonate or white lead, by fumes of acetic and carbonic acid. The gas works in this vicinity are extensive, and very substantial and neatly kept. The entire hill to the rear, of solid rock, and about 200 feet in hight, is coming down. The Oakland Ferry Slip and other improvements in prospective, are biding their time. Passing the Marine Hospital we may note Reichling's Gold and Silver Refinery. Brodie is here erecting a large foundry, at the corner of Harrison street, the building being a frame, and of redwood.

On the second page will be found an article of some importance to millmen, by Charles H. Aaron, on the amalgamation of silver ores without roasting. Mr. Aaron depends on the proper use adapted to the chemical ingredients of the ores, mainly of the sulphates of iron and copper, and endeavors to explain the chemical operation under various circumstances, presenting at the same time an ample array of facts, from experience. The words "cuprie" and "ferrie" should in every case read "cupric" and "ferric," etc.

The article on "A new Method for Treating Sulphuret Ores," describes in detail a process for chloridizing roasting, in which Plattner's gold chlorination is made to precede amalgamation. In regard to the practical operation or economical value of this method of procedure we must be permitted to express a doubt.

Mineral Phosphates.—Seven companies are engaged in working the mineral phosphates near Charleston, South Carolina.

The Pacific Railroad Celebration.—A special meeting of the Mechanic's Institute was held at the Institute rooms, on Saturday evening last, to take some initiatory measures to secure a proper celebration, in this city, of the opening of the Pacific Railroad. After considering several resolutions, and carefully canvassing the whole matter, the following resolution, offered by Gen. A. M. Winn, was finally adopted:

Resolved, That the President and Board of Directors are hereby requested to issue circulars to every association in this city, and to advertise the same in the daily papers, requesting their attendance by delegates to a Convention, for the purpose of taking measures to celebrate the opening of the Pacific Railroad, and to fix the time and place for the Convention.

The President and Board of Directors were then selected by the meeting to attend the proposed convention as delegates from the Institute.

At a subsequent meeting of the Directors, the President of the Institute was instructed to to communicate with the Mayor and Board of Supervisors, of San Francisco, asking that they extend invitations, in the name of the city authorities, to such other cities, towns, societies and organizations as they might deem expedient, to join in the celebration of the completion of the Pacific Railroad, and to tender the free use of the Pavilion for such purpose.

It is to be hoped that our citizens, and the people generally, throughout the State, will take hold of this matter in earnest, and secure such a celebration as shall be fitting to the completion of the greatest engineering enterprise ever undertaken in the history of the world.

The Gold Hill Disaster.—When we went to press, last week, telegraphic dispatches had just been received in this city, to the effect that all hopes of rescuing any more lives from the burning mines had been abandoned, and that the mouths of the shafts leading to the mines had just been closed with the view of injecting steam to smother the fire. The steam from some six or eight boilers, under heavy pressure, was thus forced into the mines from Friday evening until Monday noon; when, under the supposition that the fire had been extinguished, the shafts were again opened, the foul gases pumped and forced out, and exploring parties sent down to examine into the condition of things. Three more dead bodies were brought up; but the fire was found to be still raging, so that no others could be recovered. The shafts were once more closed, after some two days ineffectual effort to subdue the fire with water, and steam again forced into the chambers of the mine, until it was supposed every part thereof had been reached by the vapor. They will not be opened again until next Monday, when it is hoped the fires will be effectually subdued, and the balance of the bodies removed, preparatory to the resumption of work. Some eight or ten thousand dollars have already been raised for the benefit of the sufferers, and money is still coming in to the committee appointed by the citizens for the proper disbursement of the same.

Cyclops Engine and Machine Works, is the name of a new establishment just opened at 113 Beale street, by Messrs. Hugh H. Lamont and Wm. Caldwell, as will be seen by reference to their card which appears to-day. It is the intention of this firm to engage in constructing and repairing stationary and marine engines of every description, together with mill and mining machinery, and all other work in their line. The building is new and sufficiently commodious, and as their machinery is also new, the establishment presents altogether a very pleasing and tidy appearance.

Continental Life Insurance Company, 203 Montgomery street, corner of Pine.

White Pine Summary.

Continued bad weather during the past few weeks has given idle people and correspondents ample occasion to see the future of White Pine in its most unfavorable light; the results being visible in a still larger proportion of unfavorable editorials this week, in our exchanges from this State, as well as from Nevada. Rumors are circulating in this city that the half dozen leading chloride mines have been sacking their rich ores, to send below, and to New York, with a view to selling the mines on the strength of what has been found near the surface. In certain quarters a growing confidence in the base metal range is also noticeable. White Pine stock has been selling very slowly, in San Francisco as well as in New York; so that there is no danger of the White Pine mines being valued for much more than they will prove to be worth, except by those who have gone into mining as they would into gaming. Travel on the Central Pacific Railroad has fallen off twenty per cent., and the tent makers in this city,—who are furnishing the housing for the summer's army of occupation in our great interior—report a marked decrease in their orders. Freight to Hamilton has been reduced from 30 to 20 cents per pound. All kinds of goods, and especially stores, are very cheap at White Pine. No very marked increase is shown in the shipments of bullion, the total to date, from White Pine district, being about a million and a quarter.

Rich Developments—The California. The White Pine *News* of April 7th, says the California mine rivals the Eberhardt in extent and the quality of its ore. The California is situated on a low bench of Treasure Hill, half a mile east of Shermantown. The ledge is stripped for 100 feet, and is about forty-five feet in width. The ore was covered by four or five inches of dirt, which being removed leaves the whole surface of the ledge exposed, and the entire mass is good milling ore, running by assay from $100 to $8,000 per ton. * * *Inland Empire*. April 2d, says of the California: Some idea of the wonderful richness of this mine may be gathered from the fact that the ore—a mass of argillaceous matter, resembling amalgam—after stripping off the surface dirt, is shoveled into sacks, and that much of it, by the simple process of smelting, yields from $3 to $4 per pound. A ball of this ore submitted to the blowpipe is almost instantly covered over with globules of pure silver. The most wonderful feature of the mine, however, is the vast quantity of this rich ore now in sight.

Black Hornet.—This claim at the southern point of Treasure Hill, was recently, says the *Empire*, the scene of some excitement in consequence of the development of a mass of chloride ore four feet wide "which is fully equal to the richest of the Eberhardt or California." * * Same of 4th says: We understand that the owners of the California mine have put men to work to ascertain whether the Black Hornet is a spur of the California or a distinct lead. The owners of the Black Hornet are perfectly satisfied with the arrangement, as they know that there are 50 feet of solid limestone between the two leads, similar in character and rich beyond computation.

Standing Stone.—*Empire* of 2d, says: "Dr. S. A. McMeans has taken the superintendency of the Standing Stone mine, at Mahogany Grove or Eberhardt City." * * Same of 4th: "We understand that Dr. McMeans has struck the pure stuff in his Standing Stone mine at Eberhardt City. For the workmen have taken out considerable quantities of metallic silver, and the Doctor has extended an invitation to a number of friends to visit the mine to-day and see the curiosity.

Minor Items—Little Monitor.—This mine, which is located on the California belt, presents very encouraging prospects, and ere long may fully equal in richness the California or Black Hornet. * * Recently the Great Union Tunneling Co. advertised for sealed proposals to drive a tunnel in a distance of 200 feet, with the privilege on the part of the bidder to continue the tunnel to 500 feet. Over forty bids were put in.

Lady Washington, No. 3.—Col. John Kerr, Superintendent and one of the principal owners of this mine, situated near Eberhardt City, is pushing work upon it with vigor and with the most flattering success. A large body of very fine chloride has been developed.

Bullion.—Wells, Fargo & Co. dispatched from the Hamilton office, yesterday, six bars of bullion, valued at $12,000.

Struck Water.—T. M. Luther and Jerry Huey have been engaged in driving a tunnel in the ravine below Shermantown for the purpose of procuring a supply of water for milling. We learn from the *News* of the 7th that their efforts have been successful. * * The quartz mill at Shermantown, built by L. B. Mooro and C. O. Barker—formerly the Butte of New York Cañon, north of Austin—has recently been purchased by Drake & Applegarth for the sum of $40 000.

New Tunneling Co.—The California State Tunneling and Mining Co. have undertaken to penetrate Treasure Hill from a point about 1,000 feet south of the Eberhardt, running nearly north for a distance of 2,400 feet, and terminating beneath Pogonip Flat. It will make a slight deflection to the west, in order to pass the main Eberhardt ground, but will pierce the west extension of that mine at a depth of 400 feet from the surface. There are a great number of good mines along the line of the proposed tunnel. Work has already been commenced and the discovery of a promising ledge was made at the start. They claim the exclusive right of tunnelway for a width of 100 feet on each side of their line, and will claim 2,400 feet on each ledge they may discover. The members of this company chiefly hail from the valley of San José, Cal.

Black Cloud.—White Pine *News*, April 7th: The Black Cloud is situated on the southern slope of Treasure Hill, a short distance south of the Eberhardt. Yesterday we learned that a rich strike had been made in the Black Cloud at a depth of but fifteen feet, and another nearer the surface.

Biggs.—In the Biggs' mine, about half a mile from here, rock has been blasted out which is pronounced good by experts. On the Treasure Street Range blasting is continuous, and the exhibitions are such as to encourage those engaged in its exploration. We have heard of some fine discoveries near the Argyle claim at Treasure, but the particulars are, for the nonce, withheld.—*Inland Empire, 9th.*

"Vein" vs. "Deposit."—The *White Pine News* of April 3d says: Those who contend that the silver ores of Treasure Hill are only in small deposits, and not in fissure veins, would do well to examine the vein containing the Phœnix, Parker and Featherstone mines. On the grade leading to the Hamilton is seen the opening of the Phœnix, which attracts attention from the regularity of its formation and the richness of its ores. The opening is not very extensive, but some forty or fifty tons of very valuable ore is walled up by the side of the road. The foot wall seems the only one found, and from appearances we should judge the main ledge to be about 50 feet in thickness. Tracing the vein northerly, the Parker, which is an extension of the Phœnix, is found. Still further to the north is the Featherstone. Here the vein is more thoroughly opened. Any one examining it will not hesitate to pronounce it a true vein of great size and value. Its casings are as distinctly marked as the leaves of a book, and its strike and pitch regular.

Robinson District.—A private letter of date March 30th, describes this district and its advantageous situation. It is seven miles from Steptoe Valley, one of the finest in the State. It is 30 miles east of Hamilton, although it is 45 miles travel from that place. Among its ledges, the Elijah is 18 feet wide, and assays from $300 to $400 per ton. The City of London, the Rio Grande, and the Flying Cloud, all have croppings from 10 to 50 feet high. The writer goes on to say: "there is more metal in sight here than I ever saw in the Savage, Curry, and all the mines put together; plenty of wood and water, good roads and grass, and also a salt mine, and ores can be reduced as cheap here as in Washoe."

Systematic Exploration.—On Monday last there left Sacramento, says the *Union*, for White Pine district, a scientific expedition composed of Lieutenant-Colonel C. S. Drew and J. W. Drew, late of the United States Army; Frank E. Brown, geologist; Willie Brown, Hermann Richter, surveyor and topographer, and S. M. Holdredge, artist. They will remain in the field about three months, and probably extend their explorations as far south as the Colorado river. They have a complete outfit, including a thorough-brace Concord wagon and harness, etc., for two or four animals, saddles and equipments; portable furnace, chronometer, surveying instruments, barometer, thermometers, chemicals, etc.

Treasure City correspondent of the San Francisco *Herald*:

New developments are being made daily. Yesterday I visited the Rogers mine, which is situated about 2,000 feet below the Eberhardt, on what is known as East Eberhardt Hill. Recent developments have shown it to be one of the richest mines in the district, and so far as it has been developed, it shows a well defined fissure vein. It can be traced about 500 feet. Three assays of the ore have been made, ranging from $382 to $1,000 per ton. The shaft is about five feet deep, and the opening about nine feet wide, which is the width of the ledge.

The Bucklin mine is situated about 400 feet northeast of the Eberhardt, and is coming into notoriety rapidly. They have a shaft down about 25 feet. They are now in good milling ore, and there is every appearance of its becoming a second Eberhardt. It is, moreover, easy of access.

Seymour District.—*Inland Empire*, of April 9th, says this district was discovered about two months ago by John Centers. The locality is in a line nearly due south from Hamilton, and distant about 80 miles. It is not far from Patterson District. The ledges of Seymour are from ten feet upward, the Black Warrior being about 80 feet wide, so far as prospected. We were shown samples of the rock of the district yesterday, and have no hesitation in saying that what we saw is exceedingly rich. The Black Warrior lode has produced specimens which yielded over $5,000 to the ton. John Centers says he kept his discoveries a secret as long as he could, and until he procured all the locations he wanted. He describes the country as being well wooded and watered.

California Patents Issued.—We give, to-day, quite a large list and description of patents issued to California inventors, for the week ending March 30th, and reported to us, especially, by our Washington agent. The entire number issued was twelve—ten of which were obtained through the Mining and Scientific Press Patent Agency.

Returned.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

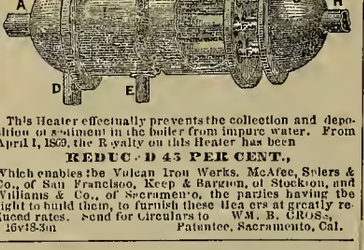
Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18-6m B. F. Howland.

Co-Operative Union Store.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 6v18-3m

PAIN KILLER!

The Great Family Medicine of the Age. Taken internally, it cures
Dysentery, Cholera, Diarrhœa,
Cramps and Pain in the stomach,
Bowel Complaints, Painters' Colic,
Liver Complaint; Dyspepsia and Indigestion,
Sore Throat, Sudden Colds,
Coughs, etc., etc.
Used externally, it cures
Boils, Felons, Cuts,
Bruises, Burns, Scalds,
Old Sores, Sprains, Toothache,
Pain in the Face, Neuralgia,
Rheumatism, Frost-bites, etc., etc., etc.
The Pain-Killer is sold by all Druggists and dealers in Family Medicines.
REDINGTON & CO., and HOSTETTER & SMITH, San Francisco Cal., General Wholesale Agents. aplm

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been
REDUCED 45 PER CENT.,
Which enables the Vulcan Iron Works, McAfee, Sulers & Co., of San Francisco, Keep & Barston, of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to WM. B. CROSS,
16v18-3m Patentee, Sacramento, Cal.

Crucibles.

The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces.
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.
On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,
1v18-3m9p 519 Front street, San Francisco

A GOOD INVESTMENT.

THE MOUNT MORIAH
Silver Mining Company,
OF ARGYLE MOUNTAIN,
White Pine District,
NEVADA.
Capital. - - - $300,000.
6,000 Shares, $50 Each.
FULL PAID AND NOT LIABLE TO ASSESSMENT.

President.....A. De LAND

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continuat working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Scamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first-class work, and we intend to do no other.

And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the *Mining and Scientific Press.*

Resources and Developments.

GROWING NUT TREES.

It is somewhat surprising,—says the *American Agriculturist,*—that with all our nation's love of gain, and the general appreciative admiration of beautiful trees for shade and ornament, we have so few instances where nut-bearing trees have been adopted for planting in the place of maple, elm, or linden. The chestnut, butternut, black walnut, and Madeira nut, where the climate will admit, are all beautiful as shade or ornamental trees; they grow very rapidly, and come into bearing usually from the seventh to the tenth year from seed. The hickory is more difficult of transplanting; but even that may be moved with success by digging deep and obtaining entire, the tap-root. This tap-root is a feature of importance with all the nut-bearing trees, its loss often resulting in the death of the tree, while, if fully retained, a tree rarely dies. It is however, more certain, and probably most economical, to plant the nuts where trees are designed to stand. This may be done and the ground yearly cropped to corn, potatoes, or small fruits, and at the end of five years or so it may be left in grass if desired.

As a paying productive crop, as a permanent investment, attended with little or no labor in the cultivation or pruning, etc., we know of nothing more reliable than that of an orchard of nut-bearing trees. The chestnut commands a ready sale at from eight to twelve dollars a bushel in the Eastern States, while the hickory nut sells freely at from two to three dollars; and these prices are being enhanced rather than reduced.

The *Agriculturist* speaks of an orchard of nut-bearing trees of sixty acres, twenty-five years old, from which the owner, last year, gathered fruit which netted him over $600. These trees stand in an open pasture, the cropping from which is scarcely diminished a dollar in consequence of its partial appropriation as above.

If such results can be obtained in the Atlantic States, where the fruit sells for a small price, what might not such culture do here, where extraordinarily high prices prevail, where the timber would be worth twice what it is at the East, and where the trees come into bearing condition in one-half the time required there? Twenty acres of ground planted to-day with nut-bearing trees, in this State, will be worth a small fortune in fifteen or twenty years hence. What better legacy could be left to a child, or what more profitable enterprise could be undertaken by a young farmer just setting out in life? The cost would be mere nothing—as the labor could all be done in the leisure time of two or three years. Perhaps no better soil in the world could be found for such culture than that of the foot-hills of this State, and on land which is lying in waste, in tracts of hundreds of acres in extent.

THE CORK OAK.—The Cork Oak appears to have been successfully introduced into Florida. A gentlemen in that State planted a number of the cork oak acorns, in 1860. Some of the trees from these acorns are now eighteen inches in circumference and from sixteen to eighteen feet high. They are said to stand the climate well. Quite a number of these trees were planted a short time since in Los Angeles County, and the fact of their successful growth in Florida may be taken as a full assurance that even better results may be anticipated on this coast, where the extremes of heat and cold are less than on even the most southern portion of the Atlantic border.

CHICORY.—Although large amounts of chicory are raised in California, it would seem that there is yet an abundance of room for an increase of the home product, as there are at least 250 tons of the root imported annually. So long as our people are determined to be humbugged, it is better perhaps, that the profits of such traffic should accrue to ourselves, rather than that they should be transferred to strangers. In this connection it may be interesting to coffee drinkers to learn the fact that

chicory can be purchased in this market for eight cents per pound, while, after it is mixed with coffee, consumers have to pay for it at the rate of from twenty-five to thirty cents.

WOOLEN MANUFACTURES.—There are in Illinois some 123 woolen manufactories, besides eighty-seven wool carding machines, which consume annually about 7,000,000 pounds of wool, clipped from not less than 2,500,000 sheep. There is no reason why California may not even exceed Illinois in this branch of industry, and it is one of the most promising signs of the times to notice that investments of capital in this direction are both increasing and prosperous. California is destined to become one of the greatest wool-producing and wool-manufacturing States in the Union.

THE LIME BUSINESS.—The manufacture of lime forms quite an important feature in the industrial resources of many portions of the State, particularly in the county of Santa Cruz, where, from the proximity to this city, it must eventually grow to mammoth proportions, if the supply is sufficient. With regard to this the *Sentinel* says: "The supply of lime rock is inexhaustible, of the blue, grey, and crystallized varieties; in most localities where the rock is found, the land is covered with timber, to be used in burning. The shipping point is from one and a half to three miles distant, with a gradual descent nearly the whole way, an ordinary team hauling five tons at a load, on wagons built for that purpose. These natural advantages bid defiance to competition from any other portion of the State. The business was first started on a small scale by parties without means except their own labor, but their success soon attracted the attention of men of capital." The shipments made by one firm in this county, reaches sixteen hundred barrels per month, which amount can be readily increased four or five fold whenever the demand will warrant the same.

THE SEAL FISHERY, on our northern coast, promises to be very lively the coming season. Quite a number of vessels are already at the Seal Islands, or on their way thither. Special agent, Charles Bryant, is on the ground, by this time, with full powers and means to enforce the law relative to these fisheries.

CALIFORNIA
Marine Metallic Paint.

This Composition, the result of scientific and chemical research, after having been thoroughly tested for the past twelve months, is now offered for sale by the "California Marine Paint Co" incorporated March 25, 1869. The experiments to which it has been submitted, have proved that it is one of the most valuable discoveries of this wonderful age of invention. It has been extensively used in painting the bottoms of all kinds of sailing vessels, wood, iron and copper, and with invariable success. Wooden bottoms, piles, etc., are thoroughly protected from the destruction of the *teredo navalis*, or sea worm; and iron vessels effectually preserved from the adhesion of barnacles, grass and all descriptions of zoophytes, no injury whatever resulting to the plates, as frequently occurs from the use of copper, and other pernicious paints; but, on the contrary, its known properties will preserve them.

By the use of this Paint, coppering vessels is rendered unnecessary; but where a vessel has been coppered it will not only keep it from fouling, but preserve the copper from the ordinary wear and tear, amounting to 10 per cent. per annum, and render it almost indestructible.

It is also invaluable for the preservation of all wooden structures, especially railroad timbers, bridges, floor beams in houses, telegraph posts, and is a certain preventive against the action of the white ant and cemugen of Mexico, China, and India.

The company are now prepared to supply all orders, and enter into contracts for the application of this Paint.

Orders and communications in regard to terms, addressed to Capt. R. H. Waterman, President; James Pollock, Superintendent Dry Dock; or L. L. Bullock, Tide Land Commissioner, will receive prompt attention.

ILLINOIS
SILVER MINING COMPANY
White Pine District.

Trustees:
JAS. H. CUTTER, R. H. FREEMAN,
E. H. SHAW, JAS. R. GARNISS,
DAVID BUSH.

The Company's Mine adjoins the celebrated "Silver Glance," and is in close proximity to the "Argyle," and other prominent mines of the District.

From developments already made, the Trustees feel justified in saying to their friends that this is one of the best opportunities ever offered for investment in this State.

For the purpose of further developing the mine, the Company has set aside a limited amount of stock, to be sold as a working capital, of which they now offer 1000 shares, at the nominal price of $2 50 per share, unassessable—the entire proceeds of which will be devoted to developing the mine.

The books of the Company are now open for subscription at the office of the Company, No. 432 Montgomery street, Room No 1, first floor. By order.

JAS. H. CUTTER, President.
G. W. STEWART, Secretary.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skilful application of their soluble principle and elaborate machinery, produced what is undoubtedly the perfection of Prepared Cocoa, that it has not only secured the preference of home spaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

Agricultural.

Cultivation of Dry Land.

The idea that the dry plains of California are utterly useless for cultivation, without irrigation, is fast becoming exploded. True, irrigation of such land to a certain extent, if it can be obtained, cheaply, is advantageous; hut farmers who till only small portions of moist lands, or such as they can readily irrigate, and suffer large tracts of adjoining dry land to lie idle, are making a great mistake. Experience has proven that much of this dry land will produce good crops of grain, clover, the mulberry, grapes and other products, without irrigation. The secret of the auccessful cultivation of dry land lies in deep plowing aud fallowing. Plow *deep* and fallow when necessary—fallowing is always advantageous. Plow in early spring, and do not put it off till summer, especially on clayey soils. Subsoiling will generally, nay always pay.

It is useless to argue that dry land cau he put iu order for crops hy shallow plowing. The Belgians, who are the best farmers in the world, assert that it is advantageous to stir the ground, if possihle, three feet deep. The roots of all plants will go down for moisture, till they fiud it, if the ground is iu proper condition. That is the reason why the vine, in this State, stands the drouth hetter after the second year,—the roots have got down where they can find moisture. It is much hetter to cultivate a little land well, than to merely run over a large surface superficially. It is too apt to be the case that less attention is paid to the cultivation of poor soil, than rich; the reverse *should* be the rule—if either is to be slighted. If land is worth plowing at all, it is worth plowing well.

Experiments on dry lands have been made in various parts of this State, which have surprised all who have become acquainted with them. Mr. G. N. Sweezy, Esq., late, if not now, President of the Northern District Agricultural Society, among others, has made important and successful experiments in this direction, on the dry plains near Marysville. Those lands, he says, yield well in grain and are good orchard lands; the grape and mulberry also do well upon them.

Deep plowing and thorough cultivation retains the rains of winter, and retards the rapid evaporation of summer. The red hills of the mountains, that were considered worthless a few years since, it is now known will produce good crops, if properly cultivated. Scratching land, however, it should he borne in mind, is not proper cultivation. These facts, if our farmers will only consider and act upon them, will be worth, in a few years, millions of dollars to the State. Small experiments cost hut little; if those interested, who are doubtful of these sayings, will only hegin slow, select a small tract, work it thoroughly and note the result,—our word for it, they will not fail to put money in their pockets at the end of two years.

BLEEDING OF GRAPE VINES—HOW TO STOP IT.—The excessive hleeding of grape vines over that of other plants, when pruned late, is due to the larger size of the vessels through which the sap is propelled, at the periods of early growth. The vessels of the vine lack the power possessed hy those of most other plants to collapse sufficiently to prevent any excessive flow of the sap, as it is received from the roots. The consequence is the plant becomes unhealthy and unproductive for the scason, and sometimes flows itself to death. The reason why there is less flow when the vine is wounded in the full of the leaf, is hecause at that time the demand upon the system by the leaves is so great that there is no surplus sap in the vine to fiud its way out through the wound.

It often hecomes necessary, however, to remove a portion of a vine when the sap is in full flow; or it may be accidentally wounded at such a time, and various expedients are adopted to prevent the consequent flow. Gum shellac paste is often used, but generally with very little effect; raw potatoes are also used with less effect. Shoemaker's wax is sometimes used. Probably the most perfect remedy, which is given by a correspondent of the *American Agriculturist*, is the following: Take four parts of scraped cheese to one part of calcined oyster shells or other pure calcareous earth. If this preparation, without any admixture with water, be pressed strongly into the pores of the wood, and the wound be closely covered with it, and bound in place, if necessary, the sap will cease to flow, so that the largest grape vine hranch may he safely taken off at any season of the year.

TO OBTAIN FRUIT FROM BARREN TREES. This may almost always he done, especially when the growth of the tree is vigorous, by windiug and tying a small cord or stout string two or three times tightly around some of the principal limhs, or if a young tree is to be operated npon, around the body of the same. This should be done in early or middle summer, and the effect will he seen in the ahundant blossoms of the next spring. The cord prevents the sap from returning so freely as it otherwise would to the roots; consequently it performs its legitimate office of forming fruit buds. This plan is similar in effect to "ringing the grape vine," and is frequeutly made use of by fruit-growers iu the Eastern States, to hasten the bearing of young trees. That, however, is a matter seldom required in this State. Our trees are naturally inclined to bear quite too young, for their after usefulness. Yet it not unfrequently happens in our older trees, that, from some cause or other, the sap descends too freely or too early in the season for the proper formation of fruit buds, and the consequence is, a lack of fruit the next year. Wire is sometimes used for this purpose; but if either wire or cord is used, they must be carefully removed before the next year's growth, or they will cut into and deform the tree or limh. Lead wire has been used to some extent; and it is decidedly preferable for the reason that it compresses the bark sufficiently to accomplish the result, while it gradually yields in length with the growth of the branch, until it finally breaks and drops off.

CALIFORNIA SEEDS AT THE EAST.—Nursery men at the East are giving earnest heed to the wonderfully productive growth of California, aud are taking active measures to secure seeds, trees, shrubs, and plants from this State. Large amounts of garden and other seeds have already found their way to Easteru farms aud gardens, where they have fully established their superiority over those grown upon the worn out soils of older lands. An interchange of seeds is always advantageous; and especially so when they are transferred from new to old soils. There seems to be an invigorating influeuce infused into almost everything of California growth which tells most unmistakahly when transferred to other soils. Europeau nurserymen have not been nnmindful of these facts, and are seeking to improve the products of their farms and gardens, also, by the same means. If nurserymen, seedmen, florists and others, in the Eastern States and Europe, would pay still more attention to the agricultural and horticultural productions of our State, they and the world at large would be decided gaiuers.

GOOD CROPS AT THE EAST.—Intelligence from the great wheat-fields of Ohio, Indiana and Illinois, are to the effect that the appearance of the fields promises an unusual large crop for the present season. Good crops and general prosperity aro so clearly allied that the latter is quite certain to follow the former, and become general throughout the country at large.

A BEECHERISM.—Some one recently suggested to Beecher that he might accomplish much good by traveling ahout the country and preaching to the people of various sections. His reply was, "It is better for the United States to go through my church than for me to go through the United States."

New Mining Advertisements.

North American Wood Preserving Company.
Location of Works: San Francisco, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the twelfth day of March, 1869, the several amounts set opposite the names of tho respective shareholders, as follows:

Names.	No. Certificate.	No. snares	Amount.
Geo W Cent	1	400	$400 00

Office, 430 Montgomery street, San Francisco ap17

Siempre Viva Silver Mining Company, District of Zarigossa, Sinaloa, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of April, 1869, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 318 California street.

Any stock upon which said assessment shall remain unpaid on the twenty-first day of May, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the seventh day of June, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.
Office, 318 California street, San Francisco. ap17

The Annual Meeting of Stockholders of the Daniel Webster Silver Mining Company, will be held on MONDAY EVENING, May 10th, at 7½ o'clock, at the office of the Company, No. 418 California street.

ap17-4w C. A. UHRIG, Secretary.

The Annual Meeting of Stockholders of the Williamantic Silver Mining Company, will be held on TUESDAY EVENING, May 18th, at 7½ o'clock, at the office of the Company, No. 418 California street.

ap17-4w C. A. UHRIG, Secretary.

Mining Notices--Continued.

Cordillera Gold and Silver Mining Company.— Morelos District, Chihuahua, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of March, 1869, an assessment of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 321 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twentieth (20th) day of April, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the tenth day of May, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY R. REED, Secretary.
Office, 321 Washington street, San Francisco. mar20

Daniel Webster Mining Company.— Location of Works: White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventh day of April, 1869, an assessment of ten cents (10c) per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on the tenth day of May, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirty-first day of May, 1869, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Trustees.

C. A. UHRIG, Secretary.
Office, No 418 California street, San Francisco.

Golden Rule Mining Company, Tuolumne County, California.—Regular Bi-monthly dividend (No. 19) of the Golden Rule Mining Company, of Tuolumne County, Cal., of 2½ per cent. per month, or fifty cents per share, is now declared, and will be paid to the Stockholders on and after the 26th inst. Office, 432 Montgomery street, Room No. 5.

J. B. RUSSELL, Secretary.
W. T. BOSWORTH, President.
A. S. PHIFER, Superintendent of Mine. ap10

Lyon Mill and Mining Company, Kelsey District, El Dorado County, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the sixth (6th) day of March, 1869, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
John Amos	58	1	$1 00
A Birrell	17	10	10 00
A C Teitman	16	82 11-13	82 84
A C Teitman, Trustee	51	11 6-13	11 46
A C Teitman	59	64 8-13	61 61

And in accordance with law, and an order of the Board of Trustees, made on the sixth (6th) day of March, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., auctioneers, No. 426 Montgomery street, on Monday, the twenty sixth day of April, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.
Office, Room 37 New Merchants' Exchange, California street, San Francisco. ap10

Mount Tenabo Silver Mining Company.—Location of Works: Cortez District, Lander County, State of Nevada.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-third day of January, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Baum, Charles	2	20	$15 10
Baum, Charles	63	50	37 50
Borel, F A	79	200	150 00
Borel, F A	81	100	75 00
Borel, F A	81	50	37 50
Borel, F A	84	50	37 50
Borel, F A	122	207	155 25
Durning, Charles	60	100	75 00
Gordon, John	18	75	56 25
Gallagher, James	50	100	75 00
Hardy, Thomas	21	300	225 00
Lehman, Chr	24	5	3 75
Leavitt, John	25	250	187 50
Murdock, C A	105	100	75 10
Murdock, C A	106	150	112 50
Murdock, C A	120	39	29 25
Probst, Kruse	117	3	2 25
Vanderwoort, J E	28	50	37 50
Wentzell, Justus	123	2	1 50
Wilson, E	96	50	37 50

And in accordance with law, and an order of the Board of Trustees, made on the twenty-third day of January, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Boro & Co., auctioneers, No. 327 Montgomery street, San Francisco, Califo nia, on the twenty-seventh day of April, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. N VAN BRUNT, Secretary.
Office 426 Montgomery street, San Francisco. p

Pacific Coal Mining Company, Contra Costa County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth day of March, 1869, an assessment of four dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the twenty-seventh day of April, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the seventeenth day of May, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

S. LACHMAN, Secretary.
Office, southeast corner Market and First streets, San Francisco. mar27

Star Creek Mining Company.—Location: Star District, Humboldt County, State of Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the twenty-sixth day of February, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Babb, L H	unissued	6	$0 60
Bates, A B, Att'y	unissued	10	214 50
Davis, Erwin	unissued	2	776
Davison, R S, Att'y	unissued	9	200 00
Faulkner, George	unissued	12	1000 00
Kent, Wm M	unissued	1	530
Levingston, Isaac	unissued	8	108
Minturn, Charles	unissued	7	100
Morrison, S A	unissued	5	100
Phelan, James	unissued	11	72

And in accordance with law, and an order of the Board of Trustees, made on the twenty-sixth day of February, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by J. Middleton & Son, 310 Montgomery street, San Francisco, on Monday, the nineteenth day of April, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

HORACE MORRISON, Secretary,
Office, N. E. cor. Front and Jackson streets, ap3

Senator Silver Mining Company.—Location of Mine: Virginia City, Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-sixth day of March, 1869, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 408 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the first (1st) day of May, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday, the twenty-eighth day of May, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.
Office, 408 California street, San Francisco mar27

Silver Sprout Mining Company.—Location of Works and Mines: Kearsarge District, Inyo county, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fifth day of March, 1869, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 408 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the first (1st) day of May, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-eighth day of May, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.
Office, 408 California street, San Francisco. mar27

Troy Ledge Mining Company, White Pine District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of March, 1869, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Friday, the twenty-third day of April, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fourth day of May, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.
Office, 37 New Merchants' Exchange, California street, San Francisco. mar20

MORNING NAUSEA.—To be sick at the stomach at the hour when healthy people are hungry for breakfast, is a very unpleasent thing. Yet there are thousands of both sexes who "feel just so" every morning of their lives. Persons who suffer from morning nausea—or from nausea at any time of the day—ought to know that their organs of digestion are in a bad state, and overloaded with crude bile. The remedy—an absolute specific in all such cases—is a course of DRAKE'S PLANTATION BITTERS. Their effect will be to tone the liver and stomach and gently relax the bowels, and before the invalid has taken this pleasant yet potent medicated stimulant for a week, he or she will have no occasion for a physician, but urgent need for the services of a cook. *

Work at the Foundries.

MINERS' FOUNDRY.

Three of Paul's dry amalgamation barrels have been made in all at the Miners' Foundry—the first one (already noticed) for Silver City, Nevada, another for Arizona, which has been shipped, and one just completed for Kearsarge District, Inyo County; severally of the size to work half a ton.

Two additional Howland's Rotary Stamp Mills have been made; one for Georgetown, El Dorado County, and one for Silver Peak, Southern Nevada. A fine wooden model of this mill may be seen at the Miners' Foundry.

The newly-invented rotary valve engine of Mr. Howland, seems to be well thought of, a strong point claimed in its favor being its economy. A 24-horse-power engine costs $1,500. One of these has just been made for Georgetown, and another for White Pine.

The artesian well borers at this establishment have struck bedrock at 220 feet depth. A pump is put down 150 feet, and water enough is gradually drawn to the spot by it, from surrounding moist earth, to answer every purpose.

A patent portable cupola smelting furnace for a Mr. McCormick, who is understood to be a practical smelter, is about to be constructed here with a view to smelting rich base metal ores in different localities in Nevada. Mr. Stewart, the ore worker at the Miners' Foundry, has recently been working thirty-five pounds of White Pine ore raw, with thirty-two pounds of amalgam as the result. Mr. Strong, on Stevenson street, generally roasts his White Pine test lots; a matter which should depend, of course, upon the mineral ingredients.

FULTON FOUNDRY.

A rotary engine of the Reichart patent, and a Poppet engine for a steamboat, are being made here.

VULCAN FOUNDRY.

The White Pine Water Company's machinery is rapidly progressing, viz., four boilers sixteen feet long, fifty-four feet in diameter, and four check valves for the air chambers of the pipe line. The engines and pumps (four) are being made at Stoddart's; and the pipe, 9,000 feet in length and twelve inches in diameter, of 1-16, 1-8, and 3-16 inch thickness, at Risdon's.

Extensive jobs have been done for the California Sugar Refinery, on Brannan street, viz: two "blowers" have been made, to blow up impurities, (somewhat on the Bessemer principle), in the refining process; one vacuum pan ten feet in diameter; a 24-inch engine, four foot stroke; two water pumps, 12x36; two air pumps, 12x36; one large hoist; four boilers sixteen feet by sixty inches; and multitudinous appurtenances.

Some interesting experiments have been made in this establishment in regard to the economy of grinding ores fine, after attaining a certain grain, in the Hepburn pan grinder; showing unexpectedly favorable results in favor of that method, as we are informed. Hepburn uses disks of iron, three inches in diameter and an inch in thickness, in his pan, which are shoved around on the bottom in such a manner as to grind against each other. Comparative figures with other methods as to economy of grinding, are promised us.

There are besides a 54x16 boiler for the Mission Woolen Mills; several small engines and boilers for La Trinidad mine, back of Guaymas, and other mines in Mexico; a 30-inch turbine for a 35 horse-power sawmill near Red Bluffs; and a 6-inch force pump for the Eureka mine, Grass Valley.

PACIFIC FOUNDRY.

A 20-stamp quartz mill; a heavy hydraulic press for the Santa Cruz Powder Mills; another hydraulic press for hay-packing; four 10-inch double-acting pumps or Von Schmidt's White Pine Water Works; a locomotive for the City Grading Company, a corporation organized for grading lots in the suburbs; and a number of miscellaneous jobs, are keeping this establishment in the usual state of activity.

GOLDEN STATE FOUNDRY.

Palmer, Knox & Co. have been making velocipedes by the hundred. A portable self-moving engine, having its wheels connected with the machinery by chain gearing, and carrying the thresher on a frame in front of the engine, is being made for a Mr. Jackson. A similar engine for a Blake's rock-breaker, is being made for T. L. Walker & Co., to be used for macadamizing streets in Oakland. Some small mills are in hand. A number of very large centrifugal grinding pans and separators, of the Hurdy pattern, are on the sidewalk, ready to take their departure for the Stephenson mill, Gold Hill.

Railroad Items.

STOCKTON AND TULARE RAILROAD.—It is rumored that the project of raising $300,000 to build the Stockton and Tulare Railroad is hanging fire, under the plea that the amount named is not enough to complete it. This objection is met by the friends of the project, with the assertion that the same is quite sufficient to *commence* it, and that when once commenced, and a short section put in working order, the advantages of the road will become so apparent that no difficulty will be found in getting whatever further amount will be needed to complete the same. The people of Stockton will be false to their own interests if they suffer the project to fall through.

WHAT RAILROADS DO FOR FARMS.—We commend the following suggestions from the *American Agriculturist* to our Stockton friends who are hesitating to come down with the necessary funds to start the proposed railroad out into the rich agricultural district to the south of that city. The calculations here submitted will apply with greater force in California where the cost of ordinary transportation is higher than it is in the Eastern States. The *Agriculturist* says:

To haul forty bushels of corn fifty miles on a wagon would cost at least $12 for team, driver and expenses. A railroad would transport for $4 at the most. Allowing an average of forty bushels per acre, the crop would be worth $8 per acre. As the relative advantage is about the same for other crops, it is clear that a railroad passing through a town would add $100 per acre to the value of the farms. A town ten miles square contains 64,000 acres. An increase of $100 per acre is equal to $6,400,000, or enough to build 200 miles of railroad, even if it costs $32,000 per mile. But 200 miles of road would extend through twenty towns ten miles square, and costs but $10 per acre, if taxed upon the land! These figures are given merely as an illustration. If the farmers had taxed themselves to build all the railroads in this country, and given them away to any companies that would stock and run them, the present increased value of their land would have well repaid all the outlay.

INCREASED PATENT FACILITIES.—A bill has been introduced into Congress to allow an increase in the number of examiners in the Patent Office. This is a matter which is greatly needed, and we trust the bill will speedily become a law. It is no more than right that inventors should have a more prompt and efficient examination of their cases. As it is, there is not only oftentimes a most vexatious delay in the examination of applications for patents; but, through the crowd of business that is forced upon the examiners, their work is not done with that care and discrimination which is desirable.

STOCKTON, April 8th, 2869.

MESSRS. DEWEY & CO.:—Your favor of the 6th inst., accompanying patent for improvement in horse shoes, is received. I beg you will accept the earnest assurance of my gratitude for your kind assistance and valuable services. Very truly yours, W. R. WATSON.

New Incorporations.

Much activity is shown this week in the formation of companies for the undertaking of fresh enterprises in mining and manufacturing, etc. No better evidence could possibly be adduced of the inviting resources of our extensive undeveloped domains, so long as the objects set forth are real; a point which can best be determined by the names and antecedents of the parties concerned, when the genuineness of the project is not of itself apparent.

As a new and promising field for the extension of the usefulness of the joint stock idea, the *Bulletin* of the 16th suggests that the homestead principle, which has worked so well when applied to city and suburban lots, might be used with good effect in dissolving some of the large land grants, which by being held so long beyond the reach of all improvements, have greatly retarded the prosperity of the State.

Parties associating on the homestead plan, says the *Bulletin*, could buy and manage one of these grants to great advantage, when the aggregate cost would be beyond the reach of a single individual of moderate means. An additional value would be given by concerted improvements as to roads and other facilities; and small farms might be readily secured in this way notwithstanding the general advance in prices, at moderate cost to the purchasers.

Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

MINING.

LEE S. M. Co.—White Pine, Nev. April 9th. Capital stock, $1,000,000; 10,000 shares, $100 each.

EASTERN ENTERPRISE S. M. Co.—White Pine, Nev. April 9th. Capital stock, $1,000,000; 10,000 shares, $100 each.

EVENING STAR, No. 1, S. M. Co.—White Pine. April 10th. Capital stock, $1,800,000; 8,000 shares, $100 each. Trustees: G. W. Beaver, H. G. Brown, M. J. McDonald, J. S. Kennedy and W. R. Wheaton.

MADDEN M. Co.—White Pine. April 10th. Capital stock, $4,000,000: 40,000 shares, $100 each. Trustees: W. R. Maurice, Henry Baker, B. B. Minor, James Kellogg and W. Wilson.

ENOCH ARDEN S. M. Co.—White Pine, Nev. April 10th. Capital stock, $1,000,000; 10,000 shares, $100 each. Trustees; Wm. B. Lake, Oliver S. Hateh and P. H. Boggs.

TEVIS S. M. Co.—White Pine, Nevada. April 12th. Capital stock, $800,000; 8,000 shares, $100 each.

WYOMING S. M. Co.—White Pine, Nev. April 13th. Capital stock, $1,400,000; 14,000 shares, $100 each.

STOCKTON M. Co.—April 13th. Capital stock, $720,000; 7,200 shares $100 each.

EMANUEL M. Co.—White Pine, Nevada. April 18th. Capital stock, $1,000,000; 10,000 shares, $100 each. Trustees: A. G. Stiles, J. McMahon, E. B. Wilder, N. C. Fassett and J. C. Wilmerding.

LUDLOW M. Co.—White Pine, Nevada. April 18th. Capital stock, $1,200,000; 12,000 shares, $100 each. Trustees: Jacob Rommel, Geo. H. Eggers, M. D. Hyneman, H. Bruns and J. H. Gardner.

ANGOSTURA S. M. Co.—White Pine, Nev. April 18th. Capital stock, $1,000,000; 10,000 shares, $100 each. Trustees: J. Preston Moore, Henry C. Swain, J. R. Garniss, Wm. J. Stringer and R. N. Van Brunt.

GREEN MOUNTAIN S. M. Co.—White Pine, Nev. April 18th. Capital stock, $1,400,000; 14,000 shares, $100 each. Trustees: J. T. Hoyt, A. J. Gove, A. T. Fletcher, D. B. Stacy and Frederick Medue.

LAND AND HOMESTEAD ASSOCIATIONS.

FLINT TRACT HOMESTEAD ASSOCIATION. San Francisco. April 10th. Capital stock, $324,000; 5,600 shares, $600 each. Trustees: J. DeForest, J. W. Jordan, H. N. Tilden, Jas. Palache, Gilbert Palache, Wm. Hollis, Edward Barry, J. L. Jonos and Wm. Sutton.

SCHOOL HOUSE EXTENSION HOMESTEAD ASSOCIATION.—San Francisco. April 10th. Capital stock, $31,500; 105 shares, $300 each. Trustees: J. W. Shaffer, John Kurtz, W. J. Gunn, Jos. Naphtaly, Charles T. Brown, D. S. Bachman and B. L. Brandt.

PIEDMONT LAND CO.—Alameda County. April 13th. Capital stock, $800,000; 8,000 shares, $100 each. Trustees: Lucius A. Booth, G. W. Beaver, Jas. Gamble, Henry S. Hudson and Geo. H. Mumford.

SAN MATEO LAND ASSOCIATION.—Redwood City. April 14th. President, John Kurtz; Secretary, I. T. Milliken; Treasurer, A. Seligman; Trustees, W. B. Cummings, George Platt, B. H. Ramsdell, Frank Soule and B. H. Freeman.

CITY HALL HOMESTEAD ASSOCIATION.—San Francisco. April 14th. Capital stock, $76,800; 128 shares, $600 each. Trustees: Wm. Monahan, T. P. Riordon, John Regan, B. B. McAllister, M. Meagher, J. C. Maynard and Owen McMahon.

SAVINGS.

MARYSVILLE SAVINGS BANK.—Secretary and Treasurer, Frank W. Aaron; Trustees, J. S. Belcher, Chas. M. Patterson, R. G. Stanwood, M. Marcuse and D. E. Knight.

ELECTION OF OFFICERS.

STOCKTON GAS CO.—Trustees, Henry H. Haight, C. E. McLane and Joseph G. Eastland.

AURORA CONSOLIDATED S. M. Co.—April 12th. President, J. D. Fry; Secretary, Joel F. Lightner; Superintendent, Frank Drake; Trustees, Thos. Bell, H. G. Blasdel, Frank Drake, J. D. Fry and Frank Livingstone.

S. F. S. & B. ASSOCIATION.—April 12th. President, M. Waterman; Vice-President, H. Steinhoff; Treasurer, M. Sichel; Secretary, P. N. Feldtman.

PACIFIC GLASS WORKS.—April 12th. Trustees, John Taylor, D. N. Hawley, J. A. Folger, John Andersou and Edmund Marks.

DOUGLAS S. M. Co.—April 13th. President, J. L. Blaikie; Secretary, J. M. Buffington; Trustees, J. E. Douglas, Robert Riddle and C. W. Randall.

BULLION M. Co.—Trustees, Thomas H. Williams, D. W. Bixley, John Mackay, F. A. Tritle and H. H. Flagg.

A. JOHNSON IN A NEW CHARACTER.—It is reported that President Johnson will, immediately after his term of office ceases, go to Europe, for the purpose of negotiating the bonds of the El Paso and Pacific Railroad Company, if that company should get its joint resolution through the Senate, now on its table, giving it the right of way through the public land from El Paso to the Pacific. The resolution gives the company a perpetual right of way through the Territories; also incorporates it. On its face it appears to be very simple, but it gives the most valuable franchise which as yet has been asked of Congress. The company can in all time forbid any other company from constructing a road from El Paso to the Pacific on the 23d parallel. The franchise, some one estimates, will be worth five or ten millions of dollars. Mr. Johnson, they propose, shall become its President.—*N. Y. Stockholder, March 9th.*

Machinery.

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

All kinds of Edge or other Tools made to order. Particular attention paid to putting in order AGRICULTURAL MACHINERY. Job Grinding and Polishing by steam. Orders from the Country promptly attended to. ☞ All work warranted.

21v17-6y **J. WEICHHART, Proprietor.**

PATENT
Boiler Scraper and Tube-Cleaner.

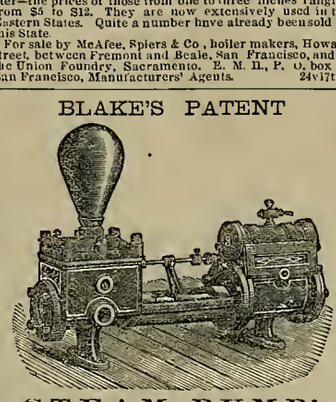
IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.

A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.

For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. H., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

BLAKE'S PATENT



STEAM PUMP!

This Pump is warranted superior to any in the market, for Breweries, Sugar Houses, Tanneries, Boiler-Feeders, Steamboats, Mining and Fire purposes, etc. It throws a full stream of the thickest beer mash without clogging, and sugar syrup boiling hot without difficulty.

Warranted a positive Pump under ALL circumstances; it never stops nor gets out of order, and by reason of the patent device in the valves, is kept clear and always ready for action. It is SIMPLE, COMPACT and POWERFUL, and needs no expert to run it.

☞ If one fails to do the work for which it is sold, it may be returned and the money will be refunded. May be seen in operation at Risdon's, or Union Iron Works, or at

Keep constantly on hand a large stock of best Bar and Bundle Iron, Boiler Tubes, Plate and Sheet Iron, Gas and Water Pipe, Anvils, Cast Steel, Gas and Water Fittings which they offer to the trade on liberal terms.

21v16-3m W. McCRINDLE, Manage.

Avery Pump and Tube Well.
Complete for Use.

The TUBE WELL is formed by driving prepared iron piping into the ground with a sledge. Although of comparatively recent invention, these wells have won a world-wide reputation, and are proven to be superior to the ordinary dug well, costing sometimes less than one-fourth that of others, and at the same time excluding the surface water and dirt. The tubing is coupled together in lengths of about six feet, as they are being driven into the earth; the valves are then dropped in and the Pump screwed down on top.

FORCE AND LIFT PUMPS

Always on hand. For ease of Working, durability and force, the Avery Pump has no superior. For circulars, etc., address Post Office box 17.

ASSESSMENT OF MINING CLAIMS.—A mass meeting of the miners of Alpine County was recently held to take action in regard to the assessment of mining claims. Their object was to suggest some mode that would secure uniformity and equality throughout the county, and at the same time satisfy the Assessor that his work had been legally and effectually done. Resolutions were adopted which expressed the opinion that undeveloped mining claims are not legally assessable; but in order to avoid litigation, they recommend that such claims, which are non-producing, and their value unknown, shall be assessed at the rate of $5 for each 200 feet of ground claimed, whether by an incorporated company or individual. They further recommended that mining claims which are developed to such an extent as to be producing, and so having an ascertained legitimate value, should be assessed on the same principle as real estate; and that all personal property belonging to claims or to mining companies should be assessed the same as other personal property in the county. In addition to the resolutions relating to the assessment, the meeting recommended the miners of the different districts in the county to pass an abandonment law to the following effect: That any undeveloped claim on which taxes have not been paid for one or more years shall be regarded as forfeited and abandoned, and liable to relocation; and that the payment of taxes shall be deemed evidence of title.

Commenting on the above, the Nevada *Gazette* says: "The action of the meeting, in our judgment, was wise and judicious. The assessment of undeveloped claims at a nominal rate, is the plan adopted in this county, while paying claims have been assessed as near as their value could be arrived at, taking into account the liability of mining property to depreciate. The recommendation that the payment of taxes should be held as evidence of title, and failure to pay evidence of abandonment, would be a good rule to adopt in all the mining districts. If a man holds a claim with the intention of ever working it, he certainly would not object to pay a yearly tax of $1 or $2, while with the rule in force, men could go to work to develop abandoned ledges, with confidence that they would not be interfered with by old claimants."

OLD FOGY MECHANICS.—"There are some engineers and mechanics that seem profoundly impressed with the belief that no new thing, no new device, can be an improvement, and they look with an unkindly or careless eye upon everything that indicates a variance with their present knowledge or practice. After they arrive at a certain age and experience, improvement, according to their exhausted ideas of the possible, is impossible. The positively perfect theory is reached by men at different ages; if it happens to a mechanic when he is in middle life, or some thirty-five or forty years old, there is no hope for his future usefulness except in a very subordinate situation. We have known two marked instances of the ill results of the belief that no change can be an improvement in the managers of locomotive shops. In one case no change of patterns, no new devices or methods were allowed, all proposed innovations were rejected, and the result was that in some fifteen years, the concern was out of date and failed. In the other case the result was nearly as bad; but before utter failure the manager was made to perceive his incapacity, and resigned, his place being taken by a "theorist" from the draughtsman's office, under whose management the works now take a leading position. There are many railway shops that are cursed by just such conservative mechanics. It does not necessarily follow that these are elderly men, as one of the best and most successful master-mechanics we know is on the wrong side of sixty-five; and no man in his profession is more alive to all improvements than he."—*Railway Times.*

HEATING CARS.—The New Haven *Journal* thus describes a new method of heating passenger cars: "A bonnet is placed on the top of the car at each end, to catch the wind while the car is in motion, and the air rushes down a pipe in a corner inside, close to a stove, which is made with a bot air jacket. On the floor of the car stands a closed box, partly filled with water. The air rushes directly into this water box, where it is thoroughly washed, and passing into the beater, is forced into pipes that run near the floor, the whole length of the car, on each side and under the seats. At proper intervals these pipes are perforated with small holes, through which the heated air then escapes. The arrangement gives satisfaction."

COPPER FROM ALASKA.—The *Oregonian*, of the 27th ult., contains the following paragraph: "We yesterday saw a boulder of metal brought down from Sitka by Captain Langdon, of the steamer Geo. S. Wright. It is heavy and has almost the appearance of genuine gold, though an expert would not mistake it. There was among those who saw it a diversity of opinion as to what it really was, some believing it to be merely copper, while others thought it might be a compound containing gold, silver and copper, or silver and copper alone. Accordingly, the nugget was yesterday taken to Charles F. Kenhn, jeweller, for test. Upon applying the acid test, copper was found to be in large proportion. No silver test had been applied when we visited Mr. Kenhn's place, but he thinks there may be a small per cent. of silver in the metal. It is soft as pure copper, and the nugget may be readily sawed or cut. The specimen was brought to Sitka by the Indians, who say they procured it on what is called Copper Creek, and that it came from a burning mountain in a fused state. It seems to have been once fused and to have been run into a crevice in the rocks. Whether or not it contains any metal more precious than copper, the locality from which it was taken must be immensely rich, if the stories of the Indians be true."

Of course the idea that this "boulder" was thrown out of a "burning mountain, in a fused state," is all moonshine. Volcanoes never throw out metals of any kind at least not in any appreciable quantity. It is more than probable that it may contain a very little silver, as native copper always does; and there is no improbability in the supposition that valuable copper mines may exist at or near the locality which this boulder was found.

THE NEW COLORING PROCESS.—The new method of permanently coloring stone, mentioned in our last, is, it seems, equally applicable to the coloring of wood. The New York *Stockholder* says: "The cheapest woods subjected to the process, take on the same hues and become as susceptible of polish as the most costly woods brought from India and Brazil. We have seen the spruce and hemlock of Maine and New Brunswick, cheap and common woods, treated by this process, assume the glittering surface of polished rosewood, apparently with all the hardness of that wood and with even superior brightness of tint. In the case of wood as of stone, the material is thoroughly permeated with the tint which it is determined to give it, and consequently the treatment is good for all time."

It is easy to see that the applications of this invention are endless. For the inside decoration of buildings and steam vessels, and for cabinet work, it will be invaluable.

NEW MANUFACTURE.—The Lenox (Mass.) Plate Glass Works are experimenting with a new article resembling porcelain, for table-tops and mantels. It is made from cryolite, a mineral brought from Greenland, which name the manufactured article will take. They are also turning glass to the novel use of mold-boards for plows, for the Western prairie lands, where the soil is very destructive to iron.

STEERING BY HYDROSTATICS.—Capt. Englefield, of the Royal Navy, has invented a mode of steering ships by hydrostatic pressure—the pressure of the water in which the vessel floats. The apparatus is, of course, below the water line, and it can be controlled from any part of the vessel. The Captain, sitting in the cabin of the largest iron clad, with a compass beside him, can steer her with his thumb and finger.—*Iron Age.*

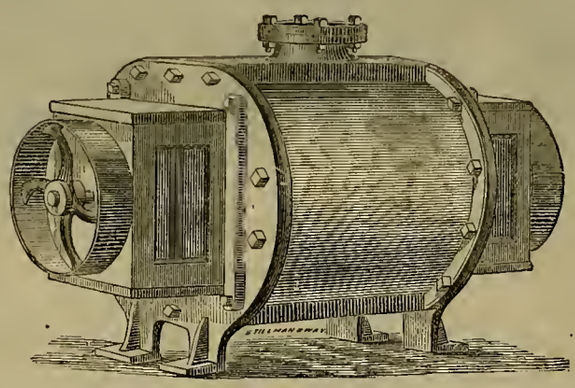
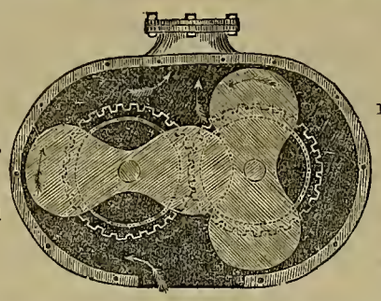
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.
Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.
Awarded the First Premium at the Paris Exposition.



ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.
CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.
For circulars and further information, address
KEEP & BARGION,

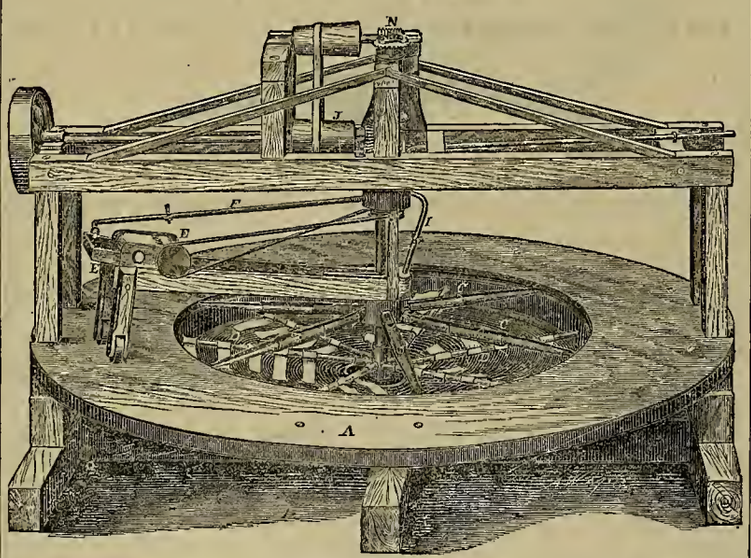
PAINE & STEPHENS'
IMPROVED CONCENTRATOR,
For Saving Gold and Silver Sulphurets.



One Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps,
Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Banner Co's mill near Nevada, and see for themselves.

CERTIFICATES:

GRASS VALLEY, Jan. 4th, 1869.—This is to certify, that we have used the Paine, Stephens & Harry Concentrators for over twelve months. They have given us entire satisfaction, and are the best we ever used. WILLIAM WATT, Supt. Eureka Mine.

This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphuret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets.
WM. L. TISDALE, Supt. Star Spangled Banner Mine.

NEVADA CITY, Oct. 26, 1868.

Any one wishing to purchase one of these useful machines, can do so by applying to THOS. N. PAINE, at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.

With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 21v15tf

White Cloud Mining District, Nevada.

In 1862-3 a party of prospectors, including Robert Truein, discovered some rich ledges in the Humboldt silver range, which they soon abandoned on account of the remoteness from civilization and difficult communication. Now the cars of the C. P. R. R. run only about thirty miles west of these mines, which are some 100 miles northwesterly from White Pine District. Oreana, in Humboldt County, Nevada, is the nearest railroad station.

J. H. Adams, Charles Silent, Col. Bee, and Frederick Smith, and one of the original discoverers, recently left San José on a trip to the locality above named, and according to the San José *Mercury*, made some twenty-two locations, including the White Cloud, Ralston, Hurricane, Republic, Lake View, Mountain View, Editors', Black Ledge, Loyal, Grant & Colfax, United States, and Buckeye. They located a town site and several mill sites, and organized the "White Cloud District," electing H. Bassett, Recorder.

A collection of rich and massive specimens were shown us lately at San José, which we are assured assay remarkably well, carrying gold, silver and copper.

The gentlemen engaged in this undertaking are well-known citizens, and are confident and energetic, and we expect to hear remarkable results from these mines at an early day. The San José *Patriot* alludes to their prospects as follows:

"A cut of four feet horizontal into the White Cloud ledge exposed a solid mass of ore richer than the croppings had indicated it to be. Five tons of ore were taken out of the cut, specimens of which may be seen at Waltenfel's book store in this city. The company are now running a tunnel to intercept the ledge about thirty feet below the croppings.

The ore is a mixture of the blue carbonate of copper, chloride of silver and streaks of rotten gold-bearing clay, very soft and easy to work. The ledges are, to all outward appearances, extensive and well defined, having mineral-stained granite for the wall-rock. The connecting rock is granite, commencing with the rotten or decayed granite at the foot-hills next to the plains, and following in regular succession towards the backbone of the ridge are the new granite, the mineral belt of precious metals, a belt of black rock having the appearance of being greased and burned, a belt of iron ore looking as if the foundries of the whole world had deposited their molten mass of metal in one grand heap; and next to the summit, or on the summit, is the timber land, well wooded with nut pine and scrub cedar. The country also contains plenty of good spring water. The claims located by the gentlemen that started from this city are situated within a circle of about one mile, and as they prospected no further than in the immediate vicinity of their claims, and the mineral belt being to all appearances very extensive, richer discoveries in that district than any yet made may reasonably be expected."

HOTEL BAGGAGE.—The proprietor of the Planters' House, in St. Louis, has been ordered by the courts to pay $2,389, the value of the contents of a trunk left there in 1865, and sold at auction with other unclaimed baggage.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

Quartz Mill Amalgamating

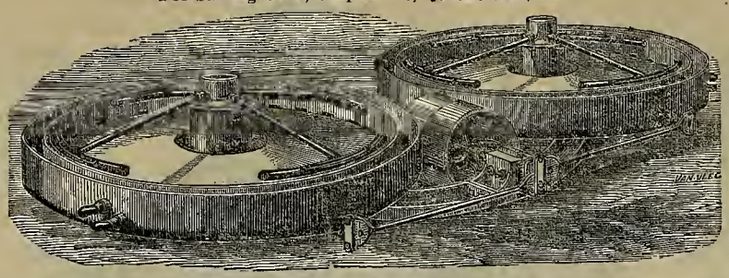
HUNGERFORD'S IMPROVED CONCENTRATOR,
For Saving Gold, Sulphurets, Quicksilver, etc.



There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well knewn Hungerford & Prater Concentrator, with which his name is already so familiar.

RECOMMENDATIONS:

SAN FRANCISCO, October 19th, 1868.

MR. M. HUNGERFORD—*Dear Sir:*—We have had twelve of your Concentrators at work at the Oneida Mine, Amador County, for about six months. They give entire satisfaction. They are strong and substantial, requiring, thus far, no repairs, and do their work thoroughly and effectively. At a recent clean-up of four of them, I found that in four weeks' time we saved about $500 in free gold, besides the sulphurets, or not far from one dollar per ton on the entire crushing of the ten stamps connected with them. In my opinion, it is for the interest of every quartz mill to have your machines. Yours, respectfully, GEORGE PRINGLE, Supt. Oneida Mine.

OFFICE OF THE ONEIDA MINING COMPANY, Jackson, May 13th 1868

MR. MORGAN HUNGERFORD—*Dear Sir:*—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any others I have used. I have ordered Messrs. Goss & Lambard to make eight more for me as soon as possible. Very truly yours, JAMES MORGAN.

BIG OAK FLAT, May 25th, 1868.—*Mr. T. W. Mulford*—DearSir:—I have used two of M. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

The Hungerford Concentrator has only to be seen to be appreciated. No millman will use any other kind after he has tried that. They are in active operation in mills throughout the State, and give perfect satisfaction.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

In future these Pans will be manufactured by GODDARD & Co., at the Pacific Iron Works, San Francisco, which is a guarantee that they will be built in the most substantial manner.

These Pans may be seen at the Pacific Iron Works, First street, near Howard, San Francisco.

Address.

GODDARD & CO., San Francisco.

Or M. HUNGERFORD, at the Pacific Iron Works.

Jennings' Improved Mining Sluice.

Whatever presents a reasonable prospect of improvement in mining operations, is worthy of attentive consideration. It is so seldom that we are enabled to give anything new in the direction of sluice building, that we are especially pleased to be able, to-day, to give a brief description of a newly-invented sluice for use either in quartz or placer mining, the invention of Mr. Orlando Jennings, of North San Juan, Nevada County, a well-known and thorough-going practical miner. Mr. J. first applied the device to the separation of gold and sulphurets from the sands issuing from a quartz mill battery; its success there attracted the attention of a neighboring placer miner who solicited and obtained the privilege of trying the principle at his hydraulic diggings, where it is now giving the highest satisfaction.

A proper working of this sluice, whether attached to a quartz mill or operated in placer diggings, requires a previous sizing of the material to be put through, and Mr. Jennings is now engaged in perfecting a convenient apparatus for this work—that for quartz mill purposes will be constructed on the principle of Rittinger's Pointed Boxes, while for placer diggings a modified "grizzly" or series of grate bars will be employed.

The annexed engraving represents a short section of the bottom of the sluice. C C represents the bottom or floor. A series of grooves and riffles will be observed at E E, running from either side to a central channel, slightly depressed in the bottom of the sluice. Such is the simple construction of the device. The principle of its working is as follows: When the ore or sand, with the water, is received into the upper end of the sluice, at A, the action of the grooves and riffles is to deflect the water, mixed with the earthy particles, from the sides to the center, until the same becomes piled up, in a longitudinal ridge, along the center of the sluice. From the top of this ridge, again, there is a tendency of the water to flow off towards the sides. This gives two currents—one towards the center on the bottom, and the other away from the center and towards the sides, on the top. The result is that the particles of the greatest specific gravity tend to the bottom central groove, while the lighter and coarser sand rises towards the surface, is rolled outwards and passes down the sluice in two separate currents, parallel to the central groove, and between it and the sides of the sluice, as shown by the waving current lines.

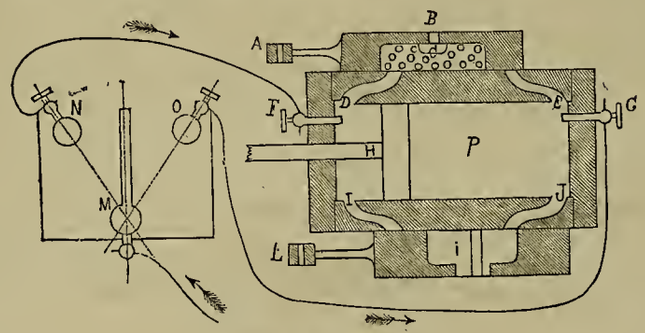
By the establishment of these concentrating and separating currents, the heavier particles are more readily and effectually separated from the lighter, than when the latter is allowed to rest directly upon the former; while at the same time the escape of the waste sands is more readily brought about and with less admixture with the metalliferous particles, than when both are allowed to pass down the sluice by the same current—the one superimposed upon the other. Application for a patent for this invention has been made through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. See advertisement in its appropriate column.

THE FIRES NOT YET EXTINGUISHED.—The latest telegraphic reports from Gold Hill report that the fire in the mines is not yet extinguished, and that the smoke is so dense in the shafts and drifts that but little effective work can be done towards their direct extinguishment. Since the accident on Monday last, by which one of the men engaged in the work of extinguishment lost his life, nothing special has occurred. Workmen are still engaged in forcing water upon the fire, wherever it can be reached; but apparently with very little effect. The injury to the mines will probably be far more serious than has heretofore been apprehended. Aside from the direct loss to stockholders, and the terrible bereavement, by loss of life, much distress is produced by the great number of people who have been thus temporarily thrown out of employment by the stoppage of work at the mines and mills. The monetary public will also feel, to a greater or less extent, the suppression of the usual yield from these mines of some $850,000 worth of bullion per month.

Lenoir's Gas Engine.

To furish an idea of the principle and method of operation of this most convenient invention, the accompanying diagram will sufficiently serve. It is necessary only to premise that one of Lenoir's machines of one half horse-power French, or nearly one horse-power English, may be seen daily at work in the office of the *Courrier de San Francisco*, on Jackson street a few doors above Montgomery.

The diagram represents a single cylinder, and all that there is of the machine except the crank-wheel which transmits the power from the piston rod H, after changing it into rotary motion, to the printing press, or any other machine, in the parlor, cellar, or garret, requiring power. Common lighting gas is the agent, in place of steam; it is mixed with atmospheric air, in a very simple manner, automatically, in the proportion of nine of air to one of gas, which makes an explosive carbureted hydrogen compound similar to the explosive gas in coal mines, or marsh gas, —the same thing. Common coal gas, or the olefiant gas of the laboratory, is CH, the explosive mine gas CH^2. Mixture of air with the former 9:1, imparts the extra equivalent of hydrogen to make it explosive.



LENOIR'S GAS ENGINE.

The gas-pipe connects with the machine at B, where, by means of an inverted cup it is measured off, at every stroke of the rod, with the proper quantity of air, and distributed evenly through the holes C, for entrance into the cylinder, alternately through the openings D and E regulated by the slide valve rod A, which shuts the one while it opens the other. On the opposite side there are similar openings I and J, and a similar slide valve arrangement L, to let out the exploded or burnt gases, ($C O_2$ and HO) carbonic acid and vapor, through I.

The moment that the space (P) in the cylinder is filled with gas, the automatic connections are such that an electric spark touches it off by the wire G, driving the piston H from a little distance on the P side of the middle, towards the other end of the cylinder, by a pressure of 5 to 6 atmospheres. But at the instant that the piston reaches a certain point a little beyond the middle, on the other side, an explosion takes place on the opposite side of the piston by a spark from F, which drives it back again. This repeats itself perpetually; the only preliminary, in the place of "steaming up" or engineering necessary being the turning on of gas, and making of the wire connection. The device by which electricity is made to touch off opposite volumes of gas alternately, is shown at M, —a piece of iron connecting with a pole of the battery, which swings by automatic connection, once to N, and then to O.

A one horse-power engine consumes about 40 cubic feet of gas per hour; which, at $6 per 1,000 feet, would amount to 24 cents an hour. The *Courrier* engine, a half horse-power, says Mr. Derbec, costs him not over 15 cents an hour. The cost for nitric acid in the battery is scarcely worth mentioning. The only trouble that has been experienced in the use of the engine thus far, has arisen from the impurity of our city gas, necessitating cleaning of the passages D and E about once a month.

These engines cost in Paris: ¼ horse-power, 800 fr.; 1 horse-power, 1,300 fr.; 2 horse-power, 2,000 fr.; 3 horse-power, 2,500 fr.

GOLD AND SILVER CHLORINATION IN MEXICO.—A valuable article by Ottocar Hoffman, on the second page, serves as an example of the definite kind of writing which is necessary on metallurgical subjects to enable others to profit by the description of a process—our real road to progress in that very important specialty—and at the same time calls for a word or two from us, of discrimination.

Chlorides of the base metals and of gold are soluble in water, while chloride of silver is not, being soluble only in salt water, or in water containing hyposulphate of soda in solution. In the Plattner gold chlorination, silver, accordingly, is lost.

If the base metal sulphurets are roasted to oxides, they cannot afterwards be chlorinated with chlorine gas; therefore if copper is to be gained, as, for example, at La Dura, salt must be added during the roasting; which chlorinates the several metals at different temperatures, but silver last, the base metal chlorides being ordinarily re-decomposed by the time that the silver becomes a chloride. In order to get both silver and gold into a state of chloride without decomposing CuCl, etc., Plattner's gas generation process is taken advantage of; and gold, copper, etc.—all but silver chloride—are leached out with water, and precipitated separately. Then the hyposulphite of soda, or the salt water leaching process, may follow, to obtain the silver.

Kustel's silver chlorination differs from the Patera process simply in the method of chloriuating silver; avoiding, by the use of chlorine gas, the necessity for a very costly and complicated double roasting, with salt, steam, and sulphate of iron.

ALL THE GOLD in the world might be put into a cube of 26 feet.

Communications.

Written for the Mining and Scientific Press.

Chlorination of Silver Ores at La Dura, Sonora, Mexico.

BY OTTOCAR HOFMANN.

The favorable result obtained by the chlorination process of Kustel & Hofman on a small quantity of ore in San Francisco, induced Mr. E. B. Smith, the Superintendent of La Dura, to engage me for the purpose of introducing that process at the La Dura mines.

These mines are situated on the Yaqui river, about 140 miles east of Guaymas. On our arrival, in consequence of a freshet, we found the Yaqui sixty feet above the normal stand, the Hacienda with all appertaining buildings swept away, leaving only the foundation and the battery. The furnaces, Varney's pans, boiler, etc., were buried in the river. The energy of Mr. Smith, however, replaced the old works in a comparatively short time, only substituting chlorination for amalgamation.

The complete property of the Pittsburg-Sonora Mining Co. consists of three veins, La Dura, Kamona and Gaxiola. From each of them ore is treated, but principally from the Kamona, which is the more favorably situated, and also better opened. Ore is abundant, and consists of light and dark fahl ore, argentiferous zinc-blende, galena and some iron pyrites. The amount of silver varies from $60 to $130 per ton. Of zinc-blende there is about eight or nine, and of copper three to four per cent. in the ore. Galena and the other base metals formerly caused a great loss of silver in amalgamating, destroying at the same time the pans, and quicksilver to a considerable degree.

The present manipulation at La Dura is executed in the following way:

1. *The Roasting.*—The ore, crushed dry through a sieve of 35 meshes, in charges of 800 pounds, is introduced in a furnace thirty feet long, in three compartments ten feet each by eight feet width. The bottom of each compartment is two and a half inches above the preceding. The charging is effected through the roof of the last hearth, where the ore is prepared by a moderate heat. After three hours the charge is removed to the second hearth, and a new one introduced in the former. On the second hearth the ore comes soon into a dark red-hot condition, requiring more stirring than in the preparatory compartment. The ore gets rid of the greater part of its sulphur, and it is necessary to change sometimes the ore from the end of the hearth to the front, nearer the fire-place. After a lapse of another three hours, the ore is moved again, now to the first hearth, nearest to the fire-place. First, an oxidizing roasting is applied to the ore for two hours, after which the firing is stopped, three to four per cent. of salt is introduced, and the ore chloridized at a low temperature for one hour. A low heat is here required on account of the volatility of the chlorides of copper and zinc, by which more silver would be carried off. Ten minutes before the discharge, half of each compartment is cleared by shoveling the ore towards the fire-place, and moved over on the next hearth as soon as the discharge of the roasted ore begins in the first compartment, so that when the discharge of 800 pounds is finished, each hearth appears already charged.

These furnaces have the advantage of not only saving fuel, but requiring a less skillful roaster to do good work. A chloridizing roasting is not necessary, unless for the purpose of gaining the copper.

The are two roasting furnaces at La Dura, capable of roasting five tons of ore.

2.—*Moistening of Ore—The Tanks.*—The roasted ore, after being cooled down somewhat, is first moistened, only so much as to prevent dusting in the next operation of throwing it through an inclined sieve. The lumps separated hereby are pulverized and returned to the roasting furnaces. What fell through the sieve is moistened by further addition of water to such a degree as to allow it to be pressed into a ball without adhering to the hand. It is mixed by two workmen, by means of shovels, and then introduced into the chlorinating tanks. Carefully charged, the ore lies loose enough to permit the gas to have an easy passage.

The tanks are 9 feet by 2½ feet deep, made of 1½ inch plants, lined with a hot mixture of pitch and tar inside. The bottom is somewhat inclined from both of the long sides towards the middle, forming a flat channel length ways. Above this there is a false bottom formed of wooden staves, partable in segments, and covered with a piece of coarse canvas, for a filter. These tanks are placed parallel with the long sides of the building, having as front one of the short sides, which stands 1½ inches lower than the opposite end. Below the false bottom in front, each tank has a leaden cock, which, by means of an india rubber hose may be connected with the chlorine gas generator when the ore is ready to be chloridized. The same cock will also serve for dischargiug the leach. On the opposite side, also below the false bottom, two pipes are inserted, one provided with a lead cock, communicating with another chlorine gas-pipe, the other leading to the water-reservoir.

The upper rim of the tank is lined with india rubber, on which the cover is fastened airtight by means of screws. This mode of shutting up the chlorinating vat air-tight is much preferable to the old way of pasting the cover with dough or clay, as is done in gold chlorination. It is cheaper, cleaner, quicker, and more perfect.

3.—*The Chlorination.*—The silver contained in the ore is found after roasting to consist of chloride, sulphate, and sulphide of silver. Exposed to the action of chlorine gas for several hours, all is converted into chloride of silver.

The chlorine is generated in the usual way, by peroxide of manganese, sulphuric acid and salt. It is conveyed through a lead pipe into the washing apparatus, and from thence through two pipes along both sides of the chlorinating tanks. Salt and manganese are cheap in Sonora; the sulphuric acid, however, is expensive. Under such circumstances the object is less the utilizing of every particle of salt, than to produce the largest quantity of gas in the shortest time. For this reason I use more manganese and salt than are required by the chemical proportion; viz: 32 pounds of sulphuric acid, 16 pounds of manganese, 16 salt, and 16 pounds of water, which proportions are sufficient to chloridize 2½ tons of ore. The chlorine enters the tanks from two sides. After 2½ or 3 hours, the gas will be observed to come out through a pips fixed above the ore, showing that the chlorination is fiuished. All pipes are shut off now, and the gas is allowed to act on the ore for five or six hours. After this time the upper pipe is brought in connection with the lead cock below the false bottom of the next prepared tank, by means of a rubber hose, and the surplus of chlorine forced over by the water entering below the false bottom from the reservoir. Using over the surplus of chlorine, the expense of chlorination is considerably reduced, and the workmen are not at all molested by the gas. The next tank is now partly filled with chlorine and the lacking part must be replaced by fresh generation. Generally 20 pounds of acid are here sufficient in place of the above 32, taking the ingredients in the proportion before stated.

4.—*Leaching out of the Base Metals with Water.*—After all the chlorine has been displaced by the entering of water, the latter is now shut off, the tank uncovered, the cock in front opened and water conveyed on the top of the ore, which must be kept submerged several inches; regulating the inflow of the water so as to be equal to the outflow. The leach is led into a tank of masonry, coated inside with pitch, (12 feet by 6 and 2 feet deep,) so long as it appears colored green from the chloride of copper. The copper is precipitated in metallic condition by means of old iron. The leaching continues till a solution of sulphide of sodium shows no precipitate of base metals. In this case the leaching with water is finished and the next process follows.

5.—*Leaching out Chloride of Silver with Hyposulphite of Soda.*—This salt, possessing the power of forming a soluble compound with the chloride of silver, must be used in a diluted condition, dissolved in water. The leach, containing silver, is conducted into two tanks, each 5 feet by 3, and 4½ feet deep, coated with pitch and tar. The silver is now precipitated by a solution of sulphide of sodium as a brownish black substance. A vigorous stirring accelerates the precipitation. A surplus of of the precipitant is injurious. The liquor must appear clear, and be neutral, that is, an addition of some more sulphide of sodium should not darken the liquid, neither should this occur by adding an argentiferous solution. The clear liquid including the sulphide of sodium used, is now again in the form of hyposulphite of soda, and ready to be used over.

The lixiviation is stopped when, in the clear liquor, taken in a glass tube with addition of some sulphide of sodium, no precipitate is obtained.

6.—*Treatment of the precipitated Sulphide of Silver.*—A few minutes after stirring the liquor appears clear above the precipitated sulphide of silver, and is drawn off by means of a syphon into a reservoir, for the purpose of using it again as a solvent. The sulphide of silver is conveyed into canvas bags, filtered, washed with warm water, pressed, dried and retorted in earthen pots connected with like vessels, kept cool in order to concentrate the silver, and to regain the sulphur, which serves for the preparation of fresh sulphide of sodium.

The retorted silver is melted in blacklead crucibles with the addition of some iron. In this operation some iron matte is obtained which contains from 4 to 5 per cent. of silver and is thrown into the battery with the ore.

7.—*General statement of results.*—The extraction of silver, in this manner, is very close, tailings assaying from 4 to 5 dollars per ton. The silver is 900 fine.

Compared with amalgamation this process offers so many advantages, locally, that its general adoption in Sonora is certain. There is no difficulty in extracting the silver within 90 per cent. of the fire assay. The working is easy, no power being required except for stamping. The process is cheap, and the capital required for the erection of such works comparatively small, so that companies with small means are enabled to beneficiate their ores, having besides the advantage of gaining the copper and gold separately, if present in the ore.

The silver ore from La Dura is known as the most refractory in Sonora. Its successful treatment induced Mr. M. Alsna, one of the most prominent and industrious mining operators of Sonora, to call upon me to introduce this chlorination process in his Hacienda at Trinidad, which is being done in the manner and with results similar to those above described.

THE RECENT EXPERIMENTS WITH THE TELEGRAPH.—In the telegraphing recently performed for the purpose of determining the mean time between Boston and San Francisco, the wires were so connected with a chronometer at Harvard University in Cambridge, that the circuit was broken and reclosed at every tick. Thus the ticks of the Cambridge time-piece may be almost said to have been heard in San Francisco. A repeater was added, and signals were sent from that city to San Francisco and back to Boston,—some six thousand miles,—in less than one minute.

INSULATION OF THE ATLANTIC CABLE.—It is found that there is a steady improvement in the cable, as regards perfect insulation,—from month to month. The first cable, laid four years since, "leaks" less than the other, from the fact that the cable can be manipulated with a much weaker battery than that originally employed, and that such diminution has now reached a surprisingly low point, it has been supposed, inexplicable as it may seem, that the electricity in the cable is gradually becoming static.

TO DISTINGUISH EDIBLE FROM POISONOUS MUSHROOMS.—Sprinkle a little salt on the spongy part or gills of the mushroom; if it turns yellow, it is poisonous, but if black, it is wholesome.

LARGE PRODUCT OF A MISSOURI IRON FURNACE.—A hot-blast charcoal furnace, 40 feet high, 9½ feet bosh, made in January 784 tons of pig-iron, of 2,268 pounds to the ton.

NATIONAL DEBTS.—The national debt of France is $58.65 to each inhabitant; that of the United States is $63, while the debt of Great Britain reaches the high figure of $130.70 to each inhabitant.

[Written for the Mining and Scientific Press.]

"Why Don't Boys Learn Trades?"

A mechanic of thirty-five years will endeavor to answer the above question, recently asked by the Philadelphia *Ledger*.

Because the education boys receive nowadays enables them to perceive where the tradesmen stand in society, and their parents also perceive and know in what grade any particular calling will place them. When the avenues to distinction are open to all, then all will take venture; consequently a boy prefers to sweep out a lawyer's office, with a hope-venture of some day becoming a lawyer; and even if he has not so high aspirations, he knows that his acquaintance, both male and female, regard his position there as higher than to be an apprentice to a trade.

Though the minister or the doctor do not take boys, yet there have been cases where their places have been filled and trades left by men who felt the pressure of their position and stepped up into them. A boy will tramp with a civil engineer's chain, flag staff, or pole, over the most ragged hillsides, for days, without murmur, because his employer, as an engineer, stands in society with other professors, and his pay corresponds to that station. Hope gives the boy courage to withstand hardships, which, as an apprentice to a trade, would break him down, spirit and body.

He sees, and his parents and guardians see, that the high places in the courts, in the pulpit, in the legislature, or executive branches of government, are very seldom filled by mechanics; and the parents know that the average of political judgment would be quite as likely to be in favor of the mechanic, as otherwise. The same may be said of the errand boy, "counter-jumper," cash boy or even porters in mercantile establishments. The social position, from the first and the material chances for the future, are infinitely better than from a trade; though the mere fact of a *living* be against the merchant boy, as a thousand to one. Very few start in life for a *living*. All start for fame and fortune, or rather it should be put now, for fortune, and fame comes with that. The fault is not with the boys, nor with their parents, as individuals; but with the state into which society has crystallized.

There is no other standard of respectability but *wealth;* consequently that is the aim of all. It comes less frequent to the mechanic, than to any other calling except the farmer. Though the farmer and mechanic are the founders and producers of all wealth; yet in the present state of society, they receive but the very smallest share of the value of their own productions.

Though money is gathered rapidly and easily in the ordinary exchange of products, it is not *made;* and when we say the merchant has made so much, in such a time, we do not express the matter in a proper manner. He has not produced a dollar. The *value* of the farmer's or mechanic's product has enabled him to place it where it was needed, and he has charged three times as much for that service as the original producer received, he consequently wears fine clothes, lives in more splendid houses, feasts on finer viands, and takes a higher place in the social scale. Boys see all this, and, consequently, won't learn trades. How far and how long the world can go on swapping knives, is a question for POLITICAL ECONOMISTS.

A RIVER UNDER THE ROCKY MOUNTAINS. Catlin, the prairie traveler, thinks that a great river, "larger than the Mississippi," flows under the Rocky Mountains. Mr. Catlin is about to submit the evidence which he has collected in favor of this startling hypothesis to the world.

IMMIGRATION INCREASE.—There was an excess of passenger arrivals at this port from Panama, for the first quarter of the present year, of 5,200 over the same time for last year.

A CURIOUS SWORD.—A sword made from a piece of meteoric iron, which fell near Santa Fe de Bogota, was once presented to Simon Bolivar.

Mechanical.

Runaway Engines.

The running away of a locomotive is, thanks to the telegraph, of no great consequence, for the alarm may be flashed past the truant, and the track kept clear until another engine can effect the capture of the runaway. A marine engine can easily be brought to reason if it make an attempt to run. But the running away of a stationary engine is a serious matter. *The Engineer* gives two instances of such an occurrence, both caused by the giving way of a governor wheel. One of these we copy in brief:

"The pace of the engine was steady and majestic, rendered so by the control of an excellent governor, which kept the throttle valve more than three parts shut. This governor was driven, by a pair of light cog wheels, from the main shaft, and it unfortunately happened on the day in question one of those wheels broke, the governor ceased rotating, the balls dropped, the throttle valve flew open, and the engines ran away. The engine driver rushed to the door of the engine-house, but a glance showed him that to enter would be to risk his life. He then ran to the stop valve on the main steam pipe in the boiler-house, but before he could close it the engines were a complete wreck; the fly-wheel was split, the entablatures and columns torn up, and the ends knocked out of the cylinders. The ruin was complete, and an entirely new pair of engines had to be put down in their place. The breakage of the governor wheel thus entailed an outlay of some thousands of pounds, besides throwing several hundred hands out of work."

How is such an accident to be prevented? "Simply,"—says the journal aforesaid,—"by so constructing the governor that when the balls are close down to the central spindle the throttle valve shall be closed. There is no difficulty whatever in effecting this. The throttle valve may be a double-beat equilibrium valve, closing when raised too high and closing when dropped too low; or the ordinary throttle valve may be so adjusted that when free from the governor it will close of itself. Then the gear must be so contrived that when the governor balls fall down to the spindle, they shall break the connection between themselves and the throttle valve. In either case it will be necessary to open the throttle by hand to start the engine, but this is a matter of small moment. When very heavy balls are used, it will be well to fix some brake arrangement to the governor in order that it may be arrested very quickly, otherwise it might continue to revolve under the influence of its own momentum, more and more slowly, opening the throttle wider and wider each moment, so that by the time the balls had fallen so far in that the throttle was allowed to close, mischief might have been done; but in very few cases indeed will this precaution be required."

ANOTHER "STEAM MAN."—The Newark *Journal* thus describes a new steam man which was first publicly exhibited, February 22d: "The "man" portion resembles in outline a human being, weighs about five hundred pounds, and is connected with a two-seated "rockaway," attached behind it by iron bands.

"Each breast of the figure contains an oscillating engine. A steam chest is placed between these, and the throttle valves are just below. The legs are composed of intricate machinery, and present an appearance, when walking, similar to that of an ordinary mortal. When in the act of stepping the feet are raised about five inches from the ground. The steam passes into the chest by means of a rubber hose, and when exhausted is carried to the smoke-stack at the rear of the carriage, through another tube. A four-horse power is placed under and at the rear of the carriage, and is provided with water by a steam pump which communicates with a water-tank under the front seat of the vehicle. The movements of the machine are controlled and regulated by two handles that rest on the dashboard. The whole apparatus, including carriage, weighs about a ton, and cost $3,000.

BOILER BUTT-JOINTS AND RIVETS.—A properly proportioned single-riveted butt-joint, with any given thickness of plates, and with covering strips on each side, possesses nearly the same strength as a properly proportioned double-riveted lap-joint or butt-joint with a covering strip on one side only. In a properly proportioned double-riveted joint the spaces between the rivet holes (measured along each line of rivets, not zigzag) should be twice as great as that required in single-riveted joints having rivets of the same diameter; and the same rule applies to single-riveted butt-joints with double-covering strips.

The proportion which the strength of a riveted joint bears to the solid plate, increases with an increase in the diameter of the rivets used. The reason for this is self-evident. The area of rivet increases as the square of the diameter, whereas the length of plate (measured along the line of the joint) removed to make room for the rivet varies as the diameter of the latter only. *The Engineer.*

WATER FOR STEEL HARDENING.—The following is an extract from a new manual on the "management of steel" by George Ede, a practical mechanic employed at Woolwich Arsenal:

"The more the water is used for hardening steel the softer it becomes, and has a tendency to act less suddenly upon the steel; consequently the less frequently the water used for the purpose is changed, the better—that is, providing the water has not by continual use become greasy. The water is not made better for giving the steel a greater degree of hardness by being long in use, but it is made better for the purpose because it is less likely to crack the steel than fresh water; therefore, as the water wastes, fresh water should be added to it. Brinish liquids, such as aquafortis, urine, or water changed with common salt, etc., produce rather more hardness than plain water; but, for most articles, plain water with the chill off gives sufficient hardness to the steel. Water at about sixty degrees, measured by the thermometer, is the most suitable temperature to prevent steel cracking in hardening. Water holding soap in solution prevents the steel from hardening.

ROLLING WIDE PLATES OF IRON.—Formerly very few armor plates were made more than five feet wide, and none, we believe, have been made exceeding six feet, in consequence of the practical difficulty of heating a mass of iron so wide as eight feet in any one furnace without burning the edges in obtaining a welding heat in the middle. This difficulty has now been overcome by a plan which consists of rolling a pile of iron lengthways, until the width required is attained, and then while hot turning it round and rolling it crossways. The first plate made by this plan was rolled on Friday. The pile was 6 feet wide, 7 feet long, and about 16 inches thick, and was first rolled to 8 feet 6 inches long, and then turned half round and rolled into a plate 8 feet 6 inches wide, 16 feet long and 5 inches thick. This is certainly the widest plate of iron of anything like this thickness that has ever been rolled."—*Sheffield Independent.*

ARE AMERICAN WATCHES ABSOLUTELY PERFECT?—The very highest priced European watches have *sometimes* a slight superiority over those of American manufacture in this single respect, viz: the greater care bestowed upon the adjustment of the escapement to pure isochronism. This correction alone is sufficient to run up the cost of a watch indefinitely. It requires the selection of a hair-spring that will give exactly equal times of vibration, whatever may be the extent of vibratory arc; that is, the tension of the spring must increase uniformly with the arc of vibration from the point of repose. The detection of such a spring, in any given case, is almost a matter of pure chance, and can only be effected by patient and repeated trials. A timepiece thus adjusted is also a most delicate instrument, and should be handled with the most profound respect for its refined virtues, lest at any time they should suddenly depart. Any binding or straining of the spring, while in the hand of a bungler, would greatly jeopardize its safety. But any good spring will very nearly fulfill this condition.—*S. W. Robinson, C. E.*

THE MONCRIEFF INVENTION.—This method of mounting heavy guns, which has been already described in our columns, has been accepted by the English government. Capt. Moncrieff receives the sum of seventy-five thousand dollars in cash, and a salary of five thousand dollars per annum for the two past years, and for as much longer as may be necessary to complete the application of his system to the national defences.

Scientific Miscellany.

THE COLORS OF AUTUMNAL FOLIAGE.—Joseph Wharton communicates the results of some experiments upon the temporary restoration of the green color of leaves,—changed by frost,—to Silliman's *Journal*. He reasoned that if chlorophyl, the green coloring matter of leaves, should be, like many other greens, a compound color, it must have for one of its elements a vegetable blue, capable of being reddened by acids. If the juices of the leaves, kept in a neutral condition by the vital force, or by alkaline matter brought in the sap from the earth, should, when circulation ceases, become acidified by the atmospheric oxygen, those juices would then be capable of reddening the vegetable blue of the chlorophyl. If, however, that vegetable blue should be thus reddened, it ought to become blue again, when exposed to an alkali; or, in other words, if green leaves should be reddened in the autumn in the manner here suggested, by the unresisted action of the oxidizing atmosphere, they ought to return from red to green, if immersed in an alkaline atmosphere.

He therefore arranged a wire staging, to stand under a glass receiver, which dipped into a dish of water, and under which was also placed a capsule containing ammonia. Upon this he placed in succession a variety of autumnal red leaves, and found that in most cases the green color was restored. Mr. W. adds; "Frémy separated chlorophyl into two distinct substances, one blue, the other yellow. Frost plays no other part in causing the autumnal tints, than to arrest the circulation. When a sharp frost occurs early in the Fall, while the pulp of the leaves is still full and plump, the red colors come out brilliantly, because there is plenty of the blue substance to be acted upon by the juices, then also abundant."

CREATION BY LAW OR BY MIRACLE.—"To meet the question of 'Whence the first organic matter'? the Nomogenist, who holds that primary life is due to the operation of existing law, is reduced to enumerate the existing elements into which the simplest living jelly (*Protogenes* of Hæckel) or sarcode (*Amœba*) is resolvable, and to contrast the probability of such elements combining, under unknown conditions, as the first step in the resolution of other forces into vital force, with the probability of the interposition of a miraculous power associating those elements into living germs, or forms with powers of propagating their kind to all time.

It seems to me more consistent with the present phase of dynamical science and the observed gradations of living things, to suppose that sarcode or the 'protogenal' jelly-speck should be formable through concurrence of conditions favoring such combination of their elements and involving a change of force productive of their contractions and extensions, molecular attractions and repulsions,—than that all existing sarcodes or '*protogenes*' are the result of genetic descent from a germ or cell due to a primary act of miraculous interposition.

Some, accepting the latter alternative, teach that, while generations of the first-created sarcode have descended to us unchanged from the period of the Laurentian limestone, other sarcodal offspring have developed and improved, or have been selected, into all higher forms of living beings. I prefer, however, while indulging in such speculations, to consider the various daily nomogencously developed forms of protozoal or protistal jellies, sarcodes and single-called organisms, to have been as many roots from which the higher grades have ramified,—rather than that the origin of the whole organic creation is to be referred, as the Egyptian priests did that of the universe, to a single egg."—*Prof. Owen.*

CAUSE OF BLUE IN HYDROGEN FLAME.—When we break up a colorless flame of hydrogen by the introduction of a solid body the flame suddenly becomes blue. M. Sallet, a pupil of M. Wurtz, now shows that this coloration is due to the vapor of sulphur. This sulphur is due to the reduction of sulphates existing in suspension in the atmosphere, — especially sulphate of soda.

THE SUN'S CONSTITUTION.—In the course of some remarks at the Cincinnati Literary Club, Jan. 2d, Prof. Abbe said: "We have thus the sun surrounded by an immense thin, transparent gas—the zodiacal light, within which is a denser atmosphere—the corona, within which is a luminous atmosphere—the photosphere, within which is the liquid molten lava-surface of the sun, and this doubtless incloses a solid nucleus."

INTENSE COLD PRODUCED BY SALINE SOLUTIONS.—The *Scientific Review* says: Dr. Phipson has recently discovered that sulphocyanate of ammonium will produce while dissolving in water, an extraordinary degree of cold; more intense than that resulting from the similar solution of any other salt. In one experiment, 35 grammes, dissolved rapidly in 35 cubic centimeters of water at 23 Cent., caused a descent of the thermometer to 10° Cent. The moisture of the atmosphere was instantly condensed on the outside of the glass in thin plates of ice.

THE "COMING" LIGHT.—From an article in the Boston *Journal of Chemistry*, upon some of the new devices for producing light, we clip the following: "A score of indefatigable, laborious students, in various parts of the world, are hard at work upon the important scientific problem of the production of a cheap and practicable light by the use of the electrical forces, and it indeed furnishes a promising field for labor and research. Moses E. Farmer, of this city, one of the most intelligent and indefatigable experimenters in the country, has devoted several years to this special department of study, and the results are exceedingly interesting and important. He is not yet ready to report progress, but this much we venture to say; a very confident expectation may be indulged, that before many months pass away, a cheap, practicable electric light will be ready to dispute with gas and kerosene a place in our workshops and dwellings."

PAPER FROM OKRA.—The Mobile *Register* describes some experiments recently made near that city, by which the following points were considered as established: That the entire okra plant, from root to pod, is available for paper-making; that it may be prepared in half the time required for rags; that it can be bleached as cheaply as rags; that the pulp works as easily as any other fiber,—and better than straw or wood; and that the paper is very strong, tough, and elastic.

RECENT EXPLORATIONS IN THE GIBRALTAR CAVES.—Capt. Frederick Brome recently explored two ancient sea-caves on the eastern face of the rock of Gibraltar,—called Martin's and St. Michael's caves. They are now more than seven hundred feet above the level of the Mediterranean. Human remains were discovered in both. An abundance of flint chips and knives, stone axes, bone ornaments and pottery, were found. Capt. B. is still engaged in explorations.

THE CHICAGO TELESCOPE.—Prof. Barnard says that this great equatorial telescope has, in comparison with the Harvard equatorial, a light as three to two. The clear illumineting aperture has a diameter of eighteen and a half inches, while that of Harvard measured fifteen. The whole diameter of the Chicago objective, mounting included, is twenty inches. The defining power of this glass is unrivalled, as has been satisfactorily proved by the discovery it enabled its constructor, Mr. Clark, to make of the companion of Sirius, a star which was confidently believed to exist, but which had eluded the refractors of Cambridge and Pultova (of exactly the same capacity), and the reflectors of Mr. Lessell and Lord Rosse.

CERIUM.—This metal has a color between that of iron and lead, and a specific gravity of about 5.5. It has been prepared by Woehler in this way: A solution of the oxide in hydrochloric acid is mixed with equal parts of chloride of potassium and chloride of ammonium and evaporated to dryness, fused, and poured out to partially cool, and then coarsely pulverized and mixed while still warm with pieces of sodium, and the whole projected into a clay crucible previously heated to redness. In this manner the cerium is reduced, and appears in the slag in the form of two pellets, which can be collected and fused into one mass.

NEW LIGHT.—Mr. J. Hogg, of Edinburgh, passes a mixture of coal gas and air through a tissue of iridio-platinum wires at a given pressure. The metal is heated to a white heat, the flame disappears, and an intense white light results, which may be used for photographic purposes as well as the magnesium light. Neither a gale of wind or a fall of rain, will extinguish it.

New Inventions.

PIERCE'S NEW DITCHING MACHINE.—A. E. Pierce, of Gilroy, recently invented a novel and ingenious ditching machine. Through the liberality of Mr. W. C. Bennett,—a public spirited and thrifty farmer, who resides close to Gilroy,—a working machine has been constructed at considerable expense, which, with some necessary modification, promises success. The machine consists of a revolving wheel some 12 feet in diameter, set at an incline, having self operating buckets arranged all around its outer edge. This wheel with suitable gearing is placed in a strong frame, to which is attached the draft and a large plow. The lower periphery of the wheel reaches down to a level with the mold-board of the plow while the upper edge is above the height of an ordinary wagon body. As the machine advances the plow throws up the earth and deposits it in the buckets, while the tractory wheel turns the inclined wheel, carrying the loaded buckets upon its inclined circle to the required hight for dumping into a cart; or the desired distance for dropping it again upon the ground. This invention attracts much interest in the growing and thriving town in which it was invented, and when sufficiently tried and proved efficient, our readers may expect an illustrated description of it in the PRESS.

DITCHING BY MACHINERY.—Mr. W. Robertson, another of our ingenious mechanics of the practical sort, has attempted to solve the important problem,—in itself undoubtedly practicable,—of ditching economically by steam power; and on Wednesday afternoon exhibited, to a number of gentlemen, a quarter working size model of his invention in operation at the corner of Howard and Eighth streets. This machine bores out the earth with a spiral drum revolved by a steam engine resting on wheels which run on planks laid on each side of where the ditch is to be. In stony or rocky ground the danger of breakage would be less than in any other machine of the kind that we have seen. Mr. Robertson claims that the machine can be worked by a steam engine of seven horse power, and that it will excavate a drain at the rate of a cubic yard a minute. By means of a universal joint or crank in the connecting rod, between the spiral drum and engine, the drum can be lowered so as to make the drain a depth of eight feet if required. The cost is from $3,000 to $5,000.

The Ohio ditcher, described in the MINING AND SCIENTIFIC PRESS three months ago, now at work on the Western Pacific Railroad, and the "Pioneer Ditcher" of Washington the Third, are predecessors in the same field.

FOOT MEASURE.—A shoe dealer of Cleveland, Ohio, has invented a novel apparatus for measuring a lady's foot. With this machine a correct measurement is taken of every part that the shoe covers, so that the whole shoe can be made the exact size and shape desired.

INVENTION WANTED.—There is a good opportunity for some given to make fortune and fame, by inventing some way to extract the sediment from champagne, which must be taken away from the bottles before they are finally corked and wired for sale. The loss from breakage of bottles and waste of wine, during the process of "ripening," as it is called, comprises a large portion of the cost of champagne. It certainly must be within the limits of possibility to devise a safety-bottle, acting, perhaps, with a valve, which will admit of a harmless "blowing off," when the pressure of the gas exceeds the bounds of safety.

ARTIFICIAL WOOD.—Some curious inventions in artificial wood have recently been made in Paris, the principal being that of combining the saw dust or wood flour with glue or size, and casting it in molds. Very perfect imitations of carved wood are made in this manner, and they are said to be fire-proof.

New Patents Issued to Pacific Coast Inventors.

FOR THE WEEK ENDING APRIL 6th.

WRENCH AND PINCERS.—Edwin Froggatt, Central City, Col.—88,621.

I claim, 1. The combination-tool, consisting of the wrench, hammer, and pincers, with or without the screw-driver, all operating and arranged substantially as specified.

2. Connecting the movable jaw B of a wrench, by means of a bar or tube *b*, with a parallel arm *c*, the jaw and arm being bifurcated, so as to straddle the slotted shank A, through which screws *d* are fitted into the parts B *c*, substantially as herein shown and described, for the purpose specified.

MACHINE FOR GILDING.—James Lick, San Francisco, Cal.—88,646.

I claim 1. The three pivoted holder-arms B, two stationary and one adjustable, provided with catches G, pivoted levers H, and set-screws I, the connecting-rod E, and pivoting-rod C, in combination with each other, and with the rack L, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the long adjusting-screw J with the pivoted holder-arms B, substantially as herein shown and described, and for the purpose set forth.

3. The book-holder block K and spring-catches M, in combination with the grooved rack L and plate-holder B C E, substantially as herein shown and described, and for the purpose set forth.

4. The combination of the arms P and springs Q with the grooved rack L, book-block K, and plate-holder B C E, substantially as herein shown and described, and for the purpose set forth.

5. The combination of the pivoted board R, springs V, catches S, and spring-catch bar T U, with the spring-arms P Q, substantially as herein shown and described, and for the purpose set forth.

6. The combination of the two pivoted adjustable arms W, provided with catches X, pivoted levers Y, and set-screws Z, the connecting-rod B, and pivoting-rod C, with each other, substantially as herein shown and described, and for the purpose set forth.

FOUNTAIN PEN.—Franzis A. Odermatt and Frank Ettlin, San Francisco, Cal.—88,656.

We claim the pen described, consisting of the hollow handle *a*, pivoted with the flexible parts *b b*, and guard-pieces *c c*, with tube *e*, with cock *d*, and head *f*, with cock *g*, the whole being combined and arranged as described, for the purpose set forth.

CLIP FOR NECK-YOKE AND WHIFFLE-TREE. Z. T. Sweet, Engene City, Oregon, (now at Davisville, Yolo County, Cal.)—88,676.

I claim the clip A, formed by the combination of the arm *a1*, lock-bar *a2*, and catch-spring *a3*, with the perforated body of said clip, substantially as herein shown and described, and for the purposes set forth.

QUILP'S PROCESS WITH SULPHURETS—leading chlorine gas separately into the roasting furnace, followed by a barrel process of dissolving gold, precipitating it again, and then amalgamating both gold and silver—draws the following from an "Inorganic" correspondent:

Quilp asserts that the chlorine gas generated is heavier than the products of combustion, or the vapors evolved from the ore while roasting. So far this is strictly true; but when he declares that it is a *much heavier* medium, he is in error. The weight of the sulphurous acid gas evolved is but very little less than that of chlorine; being as 2.21 to 2.47. Now this trifling difference of gravity is totally insufficient to permit of the lighter ascending through the heavier in the draught of a reverberatory furnace. Again assuming, for argument's sake, that the gold is chlorinated, perhaps "Quilp" will inform us how, at that heat, the chloride can remain such. If chloride of silver be formed, that compound is insoluble in water, and to precipitate the silver from its chloride without previous solution, is a new era in chemistry, the full credit of which is due to "Quilp," which nobody can deny.

The stage of heat employed under the C. H. Williams patent is not stated, so that it is possible a portion of the gold chloride formed may remain undecomposed at the end. The soluble sulphate of silver was probably intended to be provided for in the latter case. Quilp's metallurgy affords suggestive reading matter, but is rather finely theoretical.

The philosophy of chloridizing gold sulphurets when the gold is to be precipitated again before amalgamation, is—though left unexplained—undoubtedly the idea that chlorine gas, having a great affinity for gold, may be used in this manner without any additional external manipulation, to search out and render amalgamatable the refractory "rusty" particles that have baffled millmen.

A POEM, entitled "Fifty Years Ago," illustrating the world's progress, is to be read at the approaching Odd Fellows' semi-centennial, in this city, by George G. W. Morgan.

THE PRESS is one of the most valuable and instructive papers published in the United States, and every miner, millman, machinist and foundryman should be a subscriber. The information to be derived from its columns is worth many fold times the subscription.—*Grass Valley National.*

Company Transactions.

New Incorporations.

New articles of incorporation have been filed, as reported in our exchanges, during the past week, in the County Clerk's office in this city, the Secretary of State's office at Sacramento, etc., as follows:

MINING, FILED IN SAN FRANCISCO.

THE JOHN HANCOCK T. AND S. M. CO.—Object to mine for silver in White Pine District. April 17th. Capital stock, $1,500,000; divided into 15,000 shares of $100 each. Trustees: H. W. Jones, W. K. Dietrick, A. Buswell, J. H. Sager, John Hancock, H. Tietjen and Horace D. Dunn.

NATIONAL M. AND S. CO.—Location of claims White Pine. April 17th. Capital stock $2,000,000; 100,000 shares of $20 each. Trustees, S. J. Murphy, W. R. Dietrick, Peter Taylor, J. H. Gager and A. Buswell.

CHIEFTAIN.—Capital stock $1,000,000; object, tunneling and mining in White Pine. April 21st. Stock divided into 20,000 shares.

NELLIE BUTLER M. AND T. CO.—White Pine. April 22d. Capital stock $1,200,000; divided into 12,000 shares of $100 each. Trustees: Theodore E. Baugh, William P. C. Stebbins and Alphonso F. Tilden.

MAXWELL M. AND T. CO.—White Pine. April 22d. Capital stock $1,200,000; divided into 12,000 shares of $100 each. Trustees: T. E. Baugh, Henry Baker and Wm. P. C. Stebbins.

PITTSBURG T. AND M. CO.—White Pine. April 22d. Capital stock $1,000,000; divided into 10,000 shares of $100 each. Trustees: T. E. Baugh, Peter McConaghey and Wm. P. C. Stebbins.

OSCEOLA T. AND M. CO.—White Pine. April 22d. Capital stock $1,000,000; divided into 10,000 shares of $100 each. Trustees: T. E. Baugh, Wm. P. C. Stebbins and August Buttman.

IXION T. AND M. CO.—White Pine. April 22d. Capital stock $1,000,000; divided into 10,000 shares of $100 each. Trustees: James Anderson, Wm. P. C. Stebbins and T. E. Baugh.

THE THUNDERBOLT M. AND M. CO., to do business in White Pine. April 22d. Capital stock, $2,800,000; divided into 20,000 shares.

THE ECLIPSE CONSOLIDATED M. CO.—Same object. White Pine. April 22d. Capital stock put down at $5,000,000, with 50,000 shares.

THE SOUTH FEATHERSTONE S. M. CO.—White Pine. April 22d. Capital stock $1,000,000, with 20,000 shares.

THE WHANG DOODLE, ARMADILLA, PEN AND SCISSORS, AND REAL DEL MONTE—White Pine. April 22d. Capital stock $2,400,000, divided into 24,000 shares.

MINING, FILED AT SACRAMENTO.

THE PARKER LEDGE CO., mining at White Pine. Capital, $2,000,000, in shares of $100 each. Principal place of business, San Francisco. Trustees—B. M. Hartshorne, D. McLennan, Hiram Tubbs, James P. Hoyt and Frederick Madge.

THE LEE S. M. CO., and the EASTERN ENTERPRISE S. M. CO.—White Pine. They each have a capital of $1,000, in shares of $100 each. S. W. Lee, S. D. Bosworth, W. H. V. Cronise, Ellis Ayers and T. W. Colburn are Trustees for both companies.

THE EUREKA CONSOLIDATED MINING CO. Capital, $1,600,000, in shares of $50 each. Trustees—W. A. Hardie, Edward C. Lovell, James A. Hope, W. B. Rand, J. A. Lukin, J. F. Crosett, A. Rosenfield, Wm. F. Marpe, John Bays and Wm. Stuart.

THE EVENING STAR, No. 1, S. M. CO.—Capital, $1,800,000, in shares of $100 each. Trustees—George W. Beaver, R. G. Brown, M. J. McDonald, J. S. Kennedy and W. R. Wheaton.

THE LATOWANA M. CO.—Capital, $1,920,000, in shares of $100 each. Trustees—J. A. Drinkhouse, E. W. McKinstry, George Platt, Thomas J. Poulterer, John H. Wise, N. Hays and R. Savage.

THE STOCKTON M. CO. and the JOHN DARE S. M. CO., both to carry on the business of mining in the White Pine District.

LAND AND HOMESTEAD ASSOCIATIONS.

SUNNY VALE HOMESTEAD ASSOCIATION. County Clerk's office, April 21. The object is to purchase a portion of the Rancho Visitacion Guadalupe y Rodeo Viejo, and the division of the same into homesteads for distribution among the shareholders. The tract is situated on the borders of the bay, and consists of 800 lots, 30x112. Each share will consist of a full-sized lot, and will be payable in installments of $10 per month each, for twenty-five months, without interest. The capital stock is $200,000, divided into eight hundred shares of $250 each. Officers: Joseph C. Collins, President; Wm. E. Moody, Secretary; James L. Blake, Treasurer; Stephen T. King, John S. Luty, Joseph Winterburn, and Charles Cousins. Office, 708 Montgomery street.

THE WHITE TRACT HOMESTEAD ASSOCIATION.—County Clerk's office, April 22. The object is to purchase fifty-six acres of land in Solano County, known as the "White Tract," being a portion of the Suscol Rancho, and to divide the same into lots suitable for homesteads. Capital stock, $40,350; shares, 269, at $150 each.

MISCELLANEOUS ENTERPRISES.

THE MOUNTAIN SPRINGS WATER COMPANY. County Clerk's office, April 20. The object of the Company is to collect the waters of all the creeks on the south side of the Tamalpais, on the Saucelito Rancho, in the County of Marin, and convey the same to this city. Capital stock, $500,000, in 5000 shares of $100 each. Trustees—Samuel R. Throckmorton, C. R. Bonel and S. R. Throckmorton, Jr.

NEW WATERING PLACE.—THE NAPA SODA SPRINGS ASSOCIATION.—County Clerk's office, April 19. Objects, for the purchasing of the property located in the County of Napa and known as the Napa Soda Springs property, and for the purpose of securing, bottling, and selling the mineral waters of said Soda Springs, and improving and developing said springs and property as a public watering place. Capital stock, $250,000, divided into 250 shares of $1,000 each. Time of existence, 50 years. Trustees, seven in number—Hon. F. F. Low, San Francisco; Hon. John Currey, San Francisco; Gen. E. D. Keyes, Napa; Dr. J. P. Whitney, San Francisco; Dr. John F. Morse, San Francisco; Dr. A. J. Bowie, San Francisco; William Burling, San Francisco.

THE VACA VALLEY RAILROAD COMPANY, organized for the purpose of constructing, owning and maintaining a railroad running between Vacaville, in Solano County, and a point on the California Pacific Railroad distant in a southeasterly direction 3¾ miles. Secretary of State's office. Capital, $50,000, in shares of $100 each. Directors—M. Wilson, G. B. Stevenson, A. P. Bernard, David Dutton, George F. Barker, Richard Thompson, Joshua Donaldson, M. R. Miller, Thomas Deans and Demetrie Pena. The principal place of business is in Vacaville.

Meetings, Elections, Etc.

MINING COMPANIES.

THE ALMADEN G. and S. M. Co., at their annual meeting, held April 15th, elected the following Trustees: J. E. de la Montagnie, A. K. Grim, John Sime, O. Dickinson, Jr., and F. G. Smith.

THE VIRGINIA No. 2 M. Co.—At a stockholder's meeting, held at their office in this city, Monday, April 19th, at which 6,975 shares of the stock were represented, the following Trustees were elected: James P. Clough, J. F. Mitchel, E. B. Drake, John A. Steinberger, John W. Coleman. Subsequently John W. Coleman was elected President, and D. E. Stanford Secretary.

THE TROY LEDGE S. M. Co.—At a stockholder's meeting, held April 19th, the following Trustees were elected: James T. Dean, (President,) John Prince, D. L. Dunlap, J. M. Buffington, (Secretary,) and J. L. Brewer.

THE BULLION S. M. Co. held their annual meeting in Virginia, on Thursday last, April 15th. Following are the names of the Trustees elected: Thomas H. Williams, John Mackay, H. H. Flagg, D. W. Bixley, and F. A. Tritle.

SAVINGS.

SAN FRANCISCO.—A certificate of the election of Trustees of the San Francisco Savings and Building Association was filed in the County Clerk's office April 20th. Their names are F. Cohn, S. T. King, J. Wieland, C. J. Waldenberger and C. Burghofer.

MISCELLANEOUS ENTERPRISES.

THE WHITE PINE WATER CO. At a meeting held April 17th, for the election of Trustees, the following gentlemen were chosen: J. D. Fry, A. P. Stanford, Thomas Bell, Charles E. De Long and A. Hayward. The Board subsequently organized and appointed J. D. Fry, President, and B. Peart, Secretary.

THE SAN JOSE WOOLEN MANUFACTURING CO.—A stockholder's meeting was held at San Jose on the 19th inst., at the office of the Secretary, and elected the following gentlemen Trustees of the company for the ensuing year: V. D. Moody, R. F. Peckham, A. Pfister, S. O. Houghton, T. E. Beans.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

San Francisco, April 24, 1869.

Financial.

The pressure for money in our local market can scarcely be said to have relaxed. A few days ago a much improved feeling was evident, and business men began to breathe freer; but the displacement from our Branch Mint of faithful, capable and long-tried officers, to make room for political pets, had a very serious effect, because it will necessitate the closing of that institution for some weeks at a period of the greatest monetary stringency experienced here since 1855. As the business of this State is predicated wholly upon coin, the stoppage of its supply will prove our injury beyond the possibility of present estimation. For weeks all our gold refineries have been worked to their utmost capacity to supply the Mint with material for coining, yet the Mint has been barely able to meet the demand. The unfortunate change of officers cannot fail to entail a vast amount of injury to every California interest. Government allows $60,000 per annum for shrinkage on the coining operation of our Mint, but the skill and experience of the removed officers reduced the actual wastage to $10,000, saving $50,000 a year to the Government. Is it for this exhibition of skill, competency and honesty, that these gentlemen have been displaced? Is there any specially vindictive feeling against San Francisco, and California generally, among the counselors and advisers at the White House?

In city stocks the market has been quiet since our last similar reference. We note sales of 10 shares North Beach and Mission Railroad stock at $74 per share, 20 shares Spring Valley Water at $66@66 25, and 50 shares Pacific Insurance Co. at $122 60. At the close 40 shares S. F. Gas sold at $75 per share, and one share Merchants' Exchange at $30.

Mining Share Market.

The activity of the mining share market during the past week was confined to some half dozen prominent stocks, several of which show a very marked improvement over previously reported rates, viz: Hale & Norcross and American. The very favorable developments in the Hale & Norcross impart renewed confidence in the success of finding pay ore in the deep levels of the various mines on the Comstock Lode, and the present vigorous prosecution of work is looked upon very hopefully. The rather restricted operations in Comstock stocks is due to the stringency of the money market and the increased outside investments which require much amounts of cash capital.

It has been the opinion of some that at great depths in the Comstock Lode either no continuous bodies of ore would be struck, or that it would prove of low grade. This opinion was supported by somewhat of experience, but has very recently been overturned by discoveries of a rich and heavy body of ore in the Hale & Norcross, at a depth of upwards of two hundred feet below the sixth level of the Savage mine, and trending in the direction of the latter. As the work progresses the body of ore increases in richness and volume, affording every promise of continuation. This fortunate strike has imparted a more cheerful feeling to stockholders in the claims on the Comstock Lode, and especially so to those of the Hale & Norcross.

There are some twenty mines in Virginia having large amounts of ore on hand, but wholly unavailable, because of their low grade, which will not pay the cost of milling on the spot. Some Virginia mills pay as high as $50,000 per annum for hauling lumber and wood, and the Santiago mill pays $70,000 a year to haul ores from the Yellow Jacket mine. To remedy these drawbacks and utilize the vast masses of low grade ore at the Virginia mines, the project of erecting mills on the Truckee river and connecting them with the mines by means of a railroad has been conceived and will soon be carried to completion. Timber and water are abundant on the Truckee, and it is estimated that the cost of crushing in the Truckee mills will not exceed $3 per ton, for the reason that all other expenses will be reduced by the low railroad freights. The entire cost for transportation and milling is set down at $10 per ton instead of $13 and $14, as heretofore. Under these favoring circumstances, it is asserted that $20 ore will pay quite as much profit at the Truckee mills as $30 ore at the mines. In regard to the railroad, the *Bulletin's* correspondent says: "The business of carrying ore down the grade to the existing mills —six of them are on the Carson river—at present rates, would give the railroad an income of $360,000 a year. The number of mills will certainly be increased. The Union Mill Company will either build new mills on the river or remove some of their others from the towns to the water. This mill company owns upward of 30 mills, mostly engaged in working Comstock ore. The consumption of lumber would, at present rates of freight, give the line an annual income of $500,000 from that source, and the income from hauling fuel would make an equal sum. The idea of the promoters of the road, it is understood, is to make a material reduction on these charges, so that while still leaving the railroad an enormous profit so as to make a difference in the cost of working both mining and reducing low grade ores of about one-third." The same writer adds: "The Comstock lode has always been laboring under the disadvantage of too much cost at every stage of the work. Even in the matter of water, the hills are too heavy for the ore to bear, unless it is very rich. A 25-stamp mill in Gold Hill pays $700 a month for water, and cannot get enough. Its owners would save eleven or twelve cords of wood a day and all the water hill, and get an unlimited supply of water by going to Carson river; but whether they go or stay the railroad will serve them, for if they choose to go, it will bring them the ore from Gold Hill at a dollar or two a ton; and if they choose to remain where they are, it will sell them fire wood at $10 instead of $14."

Reports from White Pine continue to be of the most encouraging character. Facts, based upon figures, are furnished, as incontestible proofs of the extraordinary natural wealth of those mines. The Eberbardt mill of 10 stamps crushes at the rate of 250 tons per month, and last month turned out $100,000. Moore & Co.'s mill, 8 stamps, gives $3,000 per day in bullion, or $75,000 per month of 25 working days. Miller's mill, 10 stamps, turns out $100,000 monthly. Felton & Shaw's mill, 6 stamps, yields $50,000 per month. Moore & Co.'s mill has been purchased by the Eberhardt company for $40,000. Three mills, with an aggregate capacity of thirty-two stamps, turn out $300,000 per month. This is unequaled anywhere else in the world.

ALPHA — declined from $26 to $22, and closed at $26. From a letter dated the 21st inst., we learn that the 1,030 level is again clear of water. They found that the drifts were slightly caved at the sides. Work has been resumed in the face of the cross-cut. No signs yet of the east clay.

AMERICAN—has been in large request, advancing from $38 to $48, and closing at $49. They are now extracting rock, which is reported to yield $38 to the ton.

AMADON (Cal.)—sold to the extent of 83 shares within a range of $285@287 50. This mine continues to yield largely, the first clean-up for the present month amounting to $31,808 in bullion.

BELCHER — sold to a less extent than usual, receding from $19 to $16 50, and closing at $16 75. The mining expenses have been very materially reduced; nevertheless, they are vigorously prosecuting work in the drifts. They have commenced hauling ore from the dump to the mill, and it is believed the returns will give some profit.

CHOLLAR-POTOSI—has been in moderate request, advancing from $183 to $195, and closing at $199. During the week ending April 16th, 1,000 tons of ore were extracted. The yield from the New Tunnel is quite large, and the winze connecting this stope with the sixteenth floor of the Blue Wing has good ore in both drifts that are now being run from it. The prospects are favorable for the ore continuing below the sixteenth floor, and extending further to the south than it does at the tunnel level. Both drifts at the 500 station, Chollar-Potosi shaft, are in porphyry mixed with clay—the ore running south having water. On the 16th inst., bullion to the value of $21,800 was sent forward to the office in this city. The ore slip of the 20th inst., shows that 137½ tons of ore were sent to three custom mills.

GOULD & CURRY — advanced to $117 early in the week, receding to $110, and closing at $112. The material in the bottom of the shaft is mostly quartz, interspersed with small bunches of ore. They will open a new station at a depth of about 1,160 feet, from which drifts will be made.

HALE & NORCROSS—has been exceedingly active during the past week at improved figures, rising from $90 to $132, and closing yesterday at $128. The body of ore recently discovered in this mine has been opened to the extent of 186 feet, and is widening as the drift proceeds northward toward the Savage ground, showing an excellent quality of ore, the assays running very high, and the ore will probably give an average yield of upwards of $40 per ton at the mill. They are extracting 150 tons per day, making about 4,000 tons for the present month, of which amount the lower levels contribute very little as yet. During the week ending April 18th, the 176 and 300 levels yielded 283½ tons, the third, fourth and fifth stations 771¾, making a total of 1,055¼ tons, showing an assay value of $56,318; and during same week they delivered to the mills 894½ tons, leaving on hand 905 tons. The March returns of bullion have been increased to $70,470, with more yet to come in. To the 23d inst., the yield for the current month aggregates $35,644. The yield for the entire month will probably exceed $125,000.

IMPERIAL—has been less active, declining from $73 to $63, and closing at $71 50. The receipts so far during the present month aggregate $14,012—two shipments from the Rock Point and one from the Gold Hill mill. The daily amount of ore extracted from the Alta mine aggregates about 100 tons, with prospects of a slight increase very soon. A telegram of the 23d, says: "The drifts from the Imperial-Empire shaft continue in barren quartz and porphyry."

KENTUCK—declined from $260 to $247 50, and closed at $247....YELLOW JACKET from $61 to $56, and closed at $57 75....CROWN POINT from $56 to $53, closing at $57. The mines, by latest advices, are still on fire, but it is expected that they will be able to resume work by the first of May.

OPHIR—has been quite active, declining from $38 to $33 50, closing yesterday at $34. On the 21st inst., the drift from the shaft was 202 feet in length. They resumed work in the face of the drift on the evening of the 20th, and there seems to be no doubt that they are entering the east clay. They have passed the stream of water which comes in from the south, and the face of the drift is dry and nearly all clay.

SAVAGE—shows a very smart advance at the close, opening at $68, rising to $78, and closing at $77. The present ore deposit in the Hale & Norcross claim, running northward toward the Savage ground is about 230 feet below the sixth station of the Savage company, and may be looked upon prospectively as of some value.... SIERRA NEVADA is held at the advanced rates, small sales having been made at $51 and $53. A run of 9¾ days shows a bullion product of $8,138.

CHINAMEN UNDERGROUND. — The New York *Journal of Mining* inquires of us "whether any Chinamen in the Pacific States and Territories are allowed to work in mines underground," the writer's observation having yet discovered "no instance of the kind." They have been employed and are highly spoken of as strikers, in Calaveras and Tuolumne counties. In hydranlic mining and tunneling Chinese labor is common, in various localities.

PANAMA RAILROAD CO.—An election for Directors of the above company was held at Tontine Building, New York, April 5th, in the offices of the same, with the following result: William H. Aspinwall, Jos. W. Alsop, James M. Brown, Henry Chauncey, Edward Cunard, Fred. G. Foster, David Hoadley, Gouverneaur Kemble, Chas. P. Leverich, Howard Potter, David Stewart, Chas. W. Riley, Wm. White Wright, Jr.

POETRY AT THE MINES.—California gold diggers are, as a rule, liberal, whole-souled fellows, but there is one article in general use among the fraternity, that no miner is either willing to give away or sell, if he happens to be far remote from the source of supply. This precious commodity is PLANTATION BITTERS, the value of which, as a safeguard against malarious fevers and a support and solace under privation and hardship, are well understood by every member of that adventurous class. Last Fall, a miner who was "prospecting" on one of the tributaries of the Mariposa, had a bottle of the elixir (the only one he possessed) stolen from his tent. After having obtained, with some difficulty, a fresh supply from Sacramento, he scrawled the following lines on the lid of the box containing it:

"Who steals my "dust" steals trash, these yellow diggin's
Afford the means to pay me for such priggin's;
But if I catch them, woe the mean critters
That robs my tent of PLANTATION BITTERS."

PIONEER LAND AND LOAN ASSOCIATION.—CAPITAL $1,000,000—INCORPORATED FOR 50 YEARS. This new incorporation is under thoroughly responsible management, and offers greater inducements for the legitimate investment of money than any other Association in the State. Books, with prospectus, can be obtained at the office of the Company, 304 Montgomery street.

C. MULLER, Oculist, 205 Montgomery street, deals in all kinds of spectacles. If you cannot apply in person you can be fitted by sending description, age, etc.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

From the *Chronicle*, April 10th:—The Pennsylvania has levied an assesment of $2 per share. The mine looks promising, and an additional force will be put on next week.

Miner, 10th:—The rock now encountered in the face of the Mt. Bullion tunnel is said to contain considerable quartz and to look like being a ledge.

AMADOR COUNTY.

Ledger, April 17th:—Letter from Ione City:—The San Francisco Co., which is running a tunnel in the vein near town, have got in 50 feet. The vein is improving in size and quality,—the rock yielding about $46 to the ton by working process. Our coal mine has added to the life and thrift of our village. Those big mule teams, five or six of which are hauling coal to the quartz mills above, make quite a stir. The coal is drawn out of the tunnel by a horse car. It is the intention to put up an engine. The tunnel is in about 300 feet.

EL DORADO COUNTY.

PILOT HILL.—Placerville *Democrat*, April 17th:—The Boulder claim continues to pay handsomely. It is owned by Messrs. Blue, Martin, Owens and Rogers. We are informed that it has yielded the present season, the result of two months' work by four men, 100 ounces of gold. With a sufficient amount of water, and properly worked, it will yield three and a half ounces per day to the man. It is estimated that there are from four to six acres of ground in it that will pay.

GEORGETOWN.—The claim of Halls, Beebee & Co. continues to improve as they go down. There is no doubt that the owners have a fortune. Georgia Slide has a five and a ten stamp mill, and Woods & Co, are making preparation for another ten stamp mill. The Taylor mine owners will immediately add five more stamps to their mill, and have the main shaft sunk 100 feet deeper.

KERN COUNTY.

Havilah correspondence of Visalia *Delta*: The pump in the Joe Walker mine has given out, and nothing can be done until a new one is procured. The mine is too valuable to remain idle long. The Delphi mine has changed hands, McKeadney having sold out to George P. Dalton of Grass Valley, who is superintending the works, and expects to run the mill night and day after ten days. The New York and Clear Creek Gold Mining Co's mines are still idle, but report has it that the Co. have levied an assessment and will begin work. Col. Rand is still prospecting his mine—the rock in the shaft is very hard, but it is down over 300 feet, and good rock is found whenever a drift is run to the ledge—the shaft being sunk back of the foot wall.

MARIPOSA COUNTY.

BUCHANAN.—From the *Mail*, April 16th: The mine known as the Buchanan Copper Mine, is now owned and worked by Vilas & Co. and is yielding richer ore than ever. The Co. has between 80 and 100 men employed. The ore, a portion of which is reduced to "matte," has during the winter accumulated to thousands of tons.

NEVADA COUNTY.

SCOTT'S FLAT.—*Gazette*, April 12th: The American claims are running 200 inches of water, and employ five men. The Hueston claims are using 200 inches, and employ four hands. These claims are said to be paying well. Morrow & Co. are running 150 inches of water and four men. Cobb & Co. have eight men, and use 150 inches. This company are said to be making one hundred dollars per day above expenses. Ashburn & Co. on the opposite side of the creek, will soon be hydraulicing. Beau & Co. will commence hydraulicing to-day, working four men and running 200 inches of water.

MOONEY FLAT HYDRAULIC CO.—Same of 13th: Incorporated yesterday to carry on mining on the claims known as the Union, Kinder, Sycropolis and others.

SNEATH & CLAY MILL—same of 14th: Commenced crushing rock on Monday. The company have one hundred and fifty tons of rock on hand, and expect soon to keep their twelve stamps running. At present they employ twenty-four men underground, besides those in the mill and hoisting works.

The Telegraph company have located fifteen hundred feet on the Allison Ranch ledge, commencing at the southern boundary line and extending southerly.

MILL PURCHASE.—15th: Fogarty & Company have purchased the Collins cement mill at You Bet, and have contracted to have the machinery removed to Jones' Bar.

LITTLE YORK, 16th.—Atkins, Cozzens & Co. are putting a large amount of iron pipe in the Gardner. They are taking out from $1,700 to $2,200 at a run of two weeks.

YOU BET.—W. H. Duryea, is doing an extensive hydraulic business. His receipts average about $1,500 for every two weeks' run....Ed. Williams is running two sets of claims, using 800 inches of water, and employing seventeen men. The yield of gold averages over $1,000 for every fifteen days. ....Neece & West, who have been running their cement mill for several years, have shut down and commenced hydraulicing, and the ground is said to be paying well. ....Hussey & Co., with 250 inches of water and five men; King & Co., with the same and four men; McManus & Co., with 100 inches and three men; Brockman & Co., with 200 inches and four men; and Henry Stahr with 250 inches and four men, are making their regular runs with better prospects....Brown Bros. are running their cement mill night and day, and are taking out better pay than ever. Report says that for the past few weeks they have been taking out $4,000 to $5,000 a week. They employ from sixteen to twenty men....The towns of Red Dog and You Bet are nearly deserted, the miners mostly living at their claims....The claims at Remington, Lowell, Hunt's and Quaker Hills, and other places in the township, are in active operation.

SCOTT FLAT.—The claims of the American company cleaned up Wednesday, after a run of eight days, and yielded over $1,000. They employ four men and use 200 inches of water.

SAN JUAN.—*Transcript*, 11th: Business is lively. The mines along the Ridge are yielding handsomely.

Same of 14th: The county prospects were never better. Parties are sinking upon the Talbott ledge in Willow Valley. The Banner and Pittsburg are yielding handsomely, and other mines will soon be started up, the Mohawk among them. It is reported that the California will be started before Fall, and the old Nevada mine will soon fall into the hands of men who will work it. The Rising Star, Cornish and other mines down the creek are doing well.

FIDELITY LEDGE.—Same of 17th: This is now being worked and rich quartz is being obtained. There is a stratum of rich gold bearing sulphurets a foot thick, on the lower side of the ledge, which assays $500 to the ton.

Grass Valley *National*, April 10th: Rock now being taken from the Bowery claim near Dead Man's Flat, averages $50 to the bucketful. They are down 75 feet on the ledge, which is from six inches to a foot in width and looks well.

WILLIAM PENN MINE.—Phil. Painter, Jas. Edwards, and others are putting down a shaft, and are down about 50 feet. Ledge from 18 to 24 inches thick. A small engine of 8-horse power does the pumping and hoisting. The rock resembles that of the Eureka.

MINING SALE.—Same of 12th: We hear it reported that the southern extension of the Allison Ranch mine has been sold, or bargained to be sold, for the sum of $140,000.

WISCONSIN MINE.—13th: The water has all been pumped out. They commenced taking out ore to-day. The mine looks well.

IDAHO MINE.—This mine cleared up on Saturday $9,000 after a run of eight days.

Same of 14th: In Rhode Island Ravine, the La Cross ledge is being worked with success. On Gold Hill, new shafts are being sunk and men are making good wages. Men on Cincinnati Hill are taking out good rock. Some crushed recently paid $29 to the ton.

Grass Valley *Union*, 13th: Yesterday fifty feet of the Wm. Penn mine was sold to Ben. Macauley for $5 50 per foot cash—Macauley paying the assessments.

ALLISON RANCH MINE.—This is now in the hands of an incorporation, and will be speedily opened. Two pumps will be at work by the end of this week. The mill, which has a battery of twelve stamps, each stamp weighing a thousand pounds, will be started up to-day or to-morrow, and will crush waste rock from the dump pile. The great richness of the old dump pile is owing to the fact that in the early days they disregarded all rock except that which showed well, and years of exposure has freed the gold. The incline is down only 465 feet to the lowest level. There are four levels, and not one of them has been worked out over 700 feet. When the work stopped the ledge was as well defined as ever, the rock showing a working value of $30 per ton.

NORTH STAR MINE.—Same of 14th: The workmen are now engaged in preparing to put in the new pump of sixteen inches in diameter, to be worked by a sixteen inch cylinder engine. It is believed that this will enable the mine to be worked to an indefinite extent, in spite of water.

HOPE GRAVEL COMPANY.—15th: It is thought that the new shaft will strike about midway across the old river bed. We yesterday found that the miners had passed through the hard cement and come to the pipe clay which overlays the gravel deposit. The sinking, from this time forward, will be comparatively easy. The new shaft is 12 by four feet in the clear. All the machinery for the new pumping apparatus is on the ground.

SCANDINAVIAN.—16th: The mine is turning out good rock. The company are working the ore with two arastras driven by water power, and getting about $100 per ton.

MEADOW LAKE.—This town, which boasted but two years ago two theaters, a Stock and Exchange Board, thirteen hotels, and 3,000 souls, is to be numbered among the things that were. Only about 200 persons, great and small, passed the winter there.

PLACER COUNTY.

RICH SPECIMENS.—The Auburn *Stars and Stripes*, April 15th:—We were shown yesterday a very rich specimen from a newly discovered ledge, one mile southeast from Colfax. The parties engaged in prospecting the ledge took out in a short time about $1,500, crushing the quartz in a common hand mortar. The Rising Sun have lately struck good rock at the depth of 300 feet. The Live Oak has lately started up. One-half interest in it was recently sold for $10,000.

PLUMAS COUNTY.

Quincy *National*, April 10th:—The Caledonia Co. are pushing ahead the work in their drifts, and expect to strike the Big White ledge soon. Judkins & Kellogg's mine is paying as well as usual. Cahalan has run out on his ledge about 30 feet, and hopes to find an abundance of good pay rock soon. The Crescent Co. have 13 men at work in the mine.

La Porte *Union*:—The miners at Saw Pit have an abundant supply of water. All of the hydraulic companies have commenced piping. Water was turned loose against the bank in Conly & Gowell's diggings, near this town, on Tuesday last.

SIERRA COUNTY.

Downieville *Messenger*, April 19th:—Water has come at last, and pipes are running night and day in all the Northern portion of the county. Although the season will be short, there is a prospect that much ground will be worked.

Newark correspondence:—The different companies commenced to wash, with flattering prospects. The Swift Sure company struck an inside lead in their claim, of fabulous richness. Cook is running his tunnel to strike the same lead, with good hope of success. The Nevada Co. have got their new incline completed—raising the cars and water by water-power. The Nip and Tuck, Reading and North America, are paying handsomely.

SISKIYOU COUNTY.

Yreka *Union*, April 14th: Oscar Witherill is sinking a prospect hole in the suburbs of Yreka, near where Brady & Co. have struck such rich cement in their claim. ....We understand that there are but 11 companies of Chinamen mining on Humbug now, against 26 companies there one year ago.

The United Quartz Co. have sunk on their ledge to the depth of 100 feet. They have purchased the mill erected by Sleeper & Co. some years ago on the South Fork, and will remove it to the vicinity of the ledge.

SONOMA COUNTY.

The Petaluma *Journal and Argus* has visited the new silver mines. It says: The Davis claim is on Faylon Creek, near the mouth of Graham's Cañon, and is believed to be of considerable value. The assay of ore sent to San Francisco shows a yield of $10.56 per ton, and Mr. Davis has refused several liberal offers for his interest. Nearly south of the Faylon Creek is the South Fork. On this creek we collected a number of specimens of quartz, among them some with signs of cinnabar. The rock in both creeks is principally decomposed quartz, of a bluish color, and easy of reduction. Several gentlemen have located claims on this ledge; and it would not surprise us if their enterprise proved a profitable one. We presume there are at least 500 claims staked out in the district, all bearing more or less signs of paying rock. The general opinion of the people of the neighborhood is that it will pay to work the rock, and several companies are in process of formation. There is every advantage necessary for mining in the way of wood and water. Our own opinion is, that there is no use of rushing headlong into the speculation, as the indications are not up to our idea of what they should be.

TRINITY COUNTY.

Journal, April 17th: Mining operations continue to be pushed with energy throughout the county, and with flattering prospects. The miners have no time to lose now, as water will soon begin to slacken; but notwithstanding the extraordinary shortness of the mining season and the great scarcity of water, we believe that all hands will come out even, if not ahead.

TULARE COUNTY.

Visalia *Delta*,—White River Letter: There is not much doing here in the mines at present. T. B. Caggle, and E. Hammoud, have ground-sluiced about 5,000 yards of Gordon's Gulch, during the past winter, and are now cleaning up—they hope it will average a dollar a bucket. The Philadelphia Co. in running their adit, run the vein out. A. J. Maltby has resumed work on the Eclipse.

TUOLUMNE COUNTY.

THE OLD BUCHANAN MINE.—Sonora *Democrat*, April 17th:—This claim is again giving evidence of great wealth. Mr. Breur started a level 38 feet below the original tunnel and now has a vein from two and a half to three feet in thickness, which for 100 feet in length, will pay from $20 to $40 per ton. The crushing of 46 tons yielded last week 112 ounces of gold.

MINE SOLD.—The Detweiler and App Quartz Mine, near Poverty Hill, in Quartz Mountain, was sold last week to Frederick Griffing for the sum of $45,000.

COLORADO.

GRANITE DISTRICT.—Denver *News*, March 24th:—The Treasure Mining Co's mill has started up again. It is crushing ore from the Magenta lode. The Niagara Co's mill is about to start up on ore from the Monarch. The Yankee Blade Co. are erecting a 20-stamp mill, and Mr. Newhouse is preparing to do the same. There will be 87 stamps running in Granite next season.

Same of April 7th:—The branch mint run into bars, in three days, 1086.98 ounces of gold. On Saturday there was turned out the largest gold bar ever made in Denver, 322.55 ounces.

Herald, March 24th: Robert Teat's silver mine has been improving. Last week the vein of solid rich ore was two feet thick. Yesterday the workmen broke into a body of ore four feet wide. Dr. Blatchley has been running one of his pans on raw ore from this mine, with astonishing results.

THE CONQUEROR LODE.—The owners—Jerry Haskins and the two Disbro brothers—have been working since last fall a year ago. They have sunk a shaft and timbered it to a depth of about 200 feet. In doing this they had to pass through 100 feet of lean ore. They have now rich ore six feet wide, so soft that no powder is required, a pick and shovel are all. They are putting up a engine for hoisting. The mine will yeild ore to supply 100 stamps.

Central City *Register*, April 1st: Judge Dickerson is fitting up his 15-stamp water mill on Clear Creek....An assay yesterday of ore from the Fletcher lode gave 208 ozs. silver, and 3¼ ozs. gold per ton. Coin value $459.74. The lode is being worked by William Cook....To-day Dr. Blatchley starts up his pans in the Excelsior mill on Circassian ore....The Unexpected lode, in Lake Gulch, is producing more ore than ever before, and of a much better quality. The iron yields 11 ounces per cord under stamps....Two assays of Flora Temple sulphuret ore yielded No. 1, 8 ounces, gold, and over 400 ounces silver, per ton; No. 2, 5 ounces gold, and about 60 ounces silver.

SUGAR LOAF MINES.—Correspondence of the *Boulder Miner*, March 24th:—Mr. P. E. Gleason has hands erecting his stamp mill; will have it running in two months.....The Lincoln lode has a tunnel in 90 feet, and shows a fine vein of ore....The Hinman has a tunnel in 60 feet, showing a large vein of pyrites....The Bald Prairie has been opened to a certain extent for a half mile in length. Some remarkable rich specimens, showing native gold, have been taken out....The Legal Tender croppings show that it is a strong vein, and filled with sulphurets of silver....All the above lodes are on the North side of the Four Mile creek, and good roads can be made to all. The creek has water to supply any number of steam mills the year round. There is an abundant supply of wood.

Same of 31st: Sanders & Co. are working the Black Tail lode, on Left hand. It shows very rich argentiferous copper ore..... Strock & Co. have most of the material on the ground for an arastra....Steward, Gillespie & Co. are busy at work on the Gray Eagle lode. They have developed a fine vein of rich silver ore. Depth of shaft 50 feet....Bottolfsou, Fullen & Co.'s ten

stamp mill at Gold Hill is approaching completion....William Brierly & Co., on the Williams lode. Have some eight or ten cords of quartz, worth from $125 to $150 per cord, and a fine crevice of rich ore in sight. Bottolfson & Co. will run their surface quartz ...Carter, Blake & Co. have commenced mining on the Old Pay, silver lode, at Sugar Loaf. This lode carries some very rich ore, worth from $300 to $500 per ton ...Gleason & Co. have nearly all the timbers out for their stamp mill. They expect to have it in operation early in May....The Hoosier has a fine body of rich ore in the shaft, which is down 140 feet ...Duncan & Co., of Dexter Point, are making preparations te work the Legal Tender....M. Towner & Co. will commence working their gulch claims on Four Mile creek in a few days....Mr. Osborne is opening a gulch claim....Mr. Jackson will resume work on his gulch claims in a short time. The indications are that Four Mile creek and Gold Run will be worked more this summer than ever before.

THE HOOSIER MILL.—The Heesier mill owners, by their present plan of desulphuring, obtain from 85 to 95 per cent. of the silver contained in the ere. They obtained $60 per ton, (coin value) from ore that only yielded $5 per ten by raw treatment. They find their process exceeds their most sanguine expectations.

CENTRAL DISTRICT.—Jamestewn eerrespondence: There is sufficient material now on the eurfaco te keep the present arastras running for several weeks. The Cobh mill, 12-stamp, is undergoing slight repairs.

John Keen and George Jackson have reaumed mining on the American, Nottawa, and Stanley ledes, and are raising fine ores. Silas T. Tomlinsen and Johnson Miller will werk the Merrimac and Lest Child lodes. John Virden will work the Neikirk lode. Boyd & Co. sre working a new lode which promi'sce well. Uncle John Knoup & Co. are preparing to work their lodes. Capt. Hall, superintendent of the Topeka Co., has writteu frem Beston that they contemplate erecting reductien works.

Georgetewn *Miner*, April 1st: The Brown Company will seon have ready for shipment another immense plate of silver bullion....Huepeden & Co. have shipped, aince our last report, $847 85....Stewart's reduotion works are in successful operation. All thut is necessary for these works to produce from $1,000 to $2,000 per week is a full supply of ore. Two Blatchley pane aro in operation, doing well, both on raw and chlorodized ore. Stewart has treated four and a half tons of gold ore, from Empire, from which he obtained 82 per cent. of the assay. The amount of bullion produced by the new pans, within a week, is $635 09. All of the ore has been low grade. Next week he will start up on ore from the Mendota.

IDAHO DISTRICT. —Bennett, Wright & Co. commenced work on Thursday, with three men, and cleaned up, on Saturday, 6 ounces of clean gold....Benuzy, Koons & Co. are sinking a pit helow Grass Valley, not to hed rock yet....Legault & Co. are prospecting two miles below Idaho...Fitzpatrick & Co. are getting ready for the summer...Gus. Reader is stripping ground this side of the big bridge.

IDAHO.

ASTOR.—*Tidal Wave*, April 9th: Walsh & Warnkee have worked Astor ore in Black's mill. From Messrs. Walsh & Warnkee we get the number of tons, and from the assayer's certificate we learn the ounces of bullion and value, as follows: 13,500 pounds of ore produced 608 ounces of bullion, worth $1,364.86 coin value, or $209.97 11-100 cents per ton of ore.

ATLANTA.—SOUTH BOISE.—A 3-pound chuuk of ore from this lode which has been shown us, is exceedingly rich. Mr. Atkins and his company have run a tunnel in on the ledge 180 feet, commencing in a gulch low dowu the hill. Nothing in the mine has been found to equal the rock now being produced from the extreme end, where they are now at work. Mr. Clemens saw a piece weighing 100 pounds taken from the same place, that assayed $12,000 per ton, by chipping in various places so as to arrive at an average. Some selected rock from the main ledge assayed $26,000. The Minerva and other mines in the same neighborhood, theugh not so large as the Atlanta, assay quite as well. In fact, Yuba is just beginuing to attract attention: Mr. Atkins has a small prospecting mill on the Atlanta, with which he has been working the rock of that ledge during the winter, and for want of easy means of transportation has kept the product on hand, which now amounts to forty odd thousand dollars in bullion.

The Owyhee *Avalanche*, April 10th, has these FLINT ITEMS: We learn that the Rising Sta; Mining Co. is realizing about $1,000 per day. The expenses of the mill and mine are estimated at nbout $350 per day, which would leave a clear profit of $650 per day for the company.

Superintendent Hall has consented to let five stamps of the mill for the purpose of custom work, to accommodate the boys of Flint.

Messrs. Walsh & Warnkee breught in between 1,300 and 1,400 ounces of bullion, the proceeds of 6¼ tons of rock from the John Jacob Astor lode. And there is any amount of just as good reck in sight. The mine is now very wet, but in the course of a week they think it will be dry enough to commence eperations.

MONTANA.

BANNACK.—Helena *Post*, March 12th: The water will be running in the big ditch ou or before the first of next month, and then tho placer will commence with vigor. It is stated more gold will taken out in Bannock the coming summer than ever before.

PHILLIPSBURG.—Mr. Louis Bugher has discovered n silver lead running parallel with the Rumley & Bugher lode, which prospects finely. This new lead is abeut ten feet in width.

HIGHLAND.—April 2d: We had the eatisfaction of observing Professer Steitz melting into a single bar three lumps of retort which weighed over 720 ounces, the product of 14 tens of tailings from the Myers & Thompson lode.

It has been suppesed for a long time that there was an immense bank of pay gravel between Last Chance and Dry Gulch. We learn that Messrs. Whitney & Mason have been prospecting upeu this bar. They have sunk five shafts varying from 25 to 40 feet in depth, in each of which goed prospects were found. In some shafts they have found as high as 85 cents te the pan, but the average prospect was from five to nine cents.

RED MOUNTAIN.—In the Day lode, near Meese Creek, in the vicinity of Highland, the crevice is about 3½ feet wide at a depth of 70 feet. Frem ten pounds of reck which was taken at random from the richest portion of the pay crevice, four ounces nine pennyweights was taken. A pay streak of this kind of rock over 20 inches in width extends the entire length of the lode, and ie uniform in width as the depth increases.

SILVER STAR.—Tom C. Stevens, one of the owners of the Trivitt & Stevens mill, arrived last evening with 320 ounces of gold, the resnlt of five days' run with 12 stamps, the rock crushed being from the Iron Rod.

Letter from Nelson Gulch: Soveral companies are sluicing below discovery claim, and the dirt pays from $20 to $100 per day to the hand. Messrs. James and John Spears have had about six men at work this winter. Their dirt pays from $75 to $100 per day to the hand. From discovery to No. 11, below discovery, are a large uumber of pilos of dirt, which will pay very handsomely when sluiced. There is not a claim in the whole gulch hut what will pay from $16 to $100 per day to the hand when sluiced. The only thing necessary is plenty of water.

Deer Lodge items: Uncle Ben's Gulch is opening up very richly....The miners on Pilgrim Bar are making extensive preparations for mining....The Pike Peak ditch, running to the head of Pioneer Gulch is almost complete, and in about two weeks mining will commence in Pioueer Gulch.

NEVADA.

RUMBOLDT.

PRIDE OF THE MOUNTAIN.—*Register*, April 10th:—Winnemucca correspondent says: Buck & Kimble, the proprietors of this mine, left here this week for San Francisco with 70 tons of assorted ore. I think this is the largest shipment of ore ever made from this couuty at any one time. It made seven car loads. They are having their mine worked night and day, and are sinking an incline, which is now 170 feet. In sinking down, the ledge improves both in width, richness and permanency....Clark & Mullen have re-located the Etna ledge, in Prince Royal District, formerly owned by an Eastern Co., but abandoned three years ago. The new owners went to work in the old tunnel at a point where the old Co., under direction of a tape-measuring New York Superintendent had run over the vein, and in three weeks' time have opened a ledge rich in black sulphurets of silver ....The Pioneer mill is being repaired and remodled. A new 30 horse-power engine has been added, and two of the largest sized Wheeler puns ...Jake Strandeger, ou the Christiana ledge, has a large and well defined vein, abounding in ore of a superior quality....Ten and one half tons of ore from the Grunt mine, in Indian district, recently worked at the Pioneer mill, yielded $148 per ton....The Silver Mining Co. shipped 2,192 ounces of bullion.

FAIRVIEW.

The White Pine *News* of April 6th, says: The owners of the Illinois Ledge, after having run a tunnel of 1,200 feet, have struck their vein at a great depth and have obtained ore valued at $150 per ton.

REESE RIVER.

Belmont *Champion*, April 10th:—Work is progressing on the Enterprise claim with good results. The level north from the bottom of the shaft, 175 feet, is disclosing a ledge frem 17 to 20 feet wide, all of good milling ore, while a large propertion of it is chloride ore which will work from $600 to $1,000 per ton.

We learn frem Palmetto, that Col. Catherwood's mill started up again on Monday. The Kentuck and Champion mines never looked se well as at the present time.

HOT CREEK.—Cerrespondence ef the Belmont *Chronicle*: "I feel confident that a 20-stamp mill in Rattlesnake Cañon could be kept constantly running, on reck that would yield from $50 to $125 per ton. The rock could he extracted at a small cost."

WASHOE.

[In the Stock Circular, in anether portion of this paper will he found late mining news from this district.]

THE FLOWERY MINE.—Territerial *Enterprise*, April 16th: The ore now being raised from the shaft pays $34 per ton, that being taken from the open cut and incline $25, and that in the end of the north tunnel $46, hy mill process.

OCCIDENTAL.—Same of 17th: The lower tunnel is now witbin 50 feet of the lead, which it will cut 400 feet deeper than the present werkings.

TWIN.—This mine, at Silver City, continues to yield pay ore, and the ledge is found to be richer as depth is attained. The rock is easily worked, and it is essentially a geld vein, containing little or no silver.

SUNDERLAND MILL.—This institution, in Lewer Gold Hill, has been shut down for repairs the last two or three days, but again started up on ore from the Central mine.

GOULD & CURRY.—Workmen are still engaged in sinking the main shaft, through quartz of the most promising character.

The Sierra Nevada Co. now have in sight sufficient ore to run for four months, equally as rich as that which they have been working for the past two months.

OREGON.

Jacksouville *Sentinel*, April 10th: Dillon & Bowden, who owu nine-tenths of the Occidental ledge, have sunk on it about 70 feet, and at that depth it has wideued to about two feet. It was almost impossible to break a piece of the rock last taken out and not find gold in it; we saw specimens that were nearly half gold.

White Pine Summary.

RICH STRIKE.—White Pine *News*, April 3d: We understand that an exceedingly rich ledge, which has been called the Paula, was struck a few days since in the San Francisco tunnel, a few hundred feet east of the Hidden Treasure.

THE CRŒSUS.—Same of 6th: The mill at Hamilton yesterday turned out a quantity of bullion from ore from the Crœsus mine near the Hidden Treasure.

DR. BROWN.—*News*, of 7th: Some parties owning the Saginaw "ledge," offered a "green" new-comer bearing the above name, 200 feet if he would sink a 30-foot shaft, "or until he struck pay." The first blast he put in brought "good indications," and the second revealed a mass of $2,000 oro.

BLACK CLOUD.—Same of 8th: In the progress of opening, the vein is exposed to a width of about 20 feet. This tocation was made on the 19th of January, and we understand that the sum of $125,000 has been offered for it.

NEW DEVELOPMENTS.—The *News* of 13th: From the Ward Beecher and the Sage Brush, the chlorides are pouring out by the ton. The Beecher is near the Aurora, and the Sage Brush is in the middle of the southern portion of Main street. Upon the Webstera shaft has been sunk about thirty feet in depth, and the ore extracted is encouraging. A few rods south of the Daniel Webster is the Panhandle. These veins run parallel to the Eberhardt; a short distance east of them is the Alta.

Same of 14th saye: A rich strike ie reported in the Umatilla, at the lower end of Bromide Flat. The body of ore struck is so rich that it is shoveled into sacks in the mines as it is torn loose, without assorting. ....The Evening Star ledge shows a width of seven feet, and has out several tons of ore which is estimated to work $500 per ton. Some ten men at work on the Ocha Vera have developed an extensive ledge of 7½ feet in width. It is opened for 40 feet on the surface, with numerous excavntions, from which ore is taken giving nn assay of $1,300 per ton.

ANITA.—*Inland Empire*, April 14th: Werk is progressing rapidly, and the further dewn the shaft is snuk the better the ore. It is on the read from Hamilton to Shermantewn, the ledge crossing the road directly west of Treasure City. The ledge is four feet wide at the depth of ten feet, and assays well. There are now 20 tens of the ore from the shaft on the dump, which will be sent to mill next week.

MILLS AT SHERMANTOWN.—*News*, April 3d: Several mills are in course of construction at Shermantown. One by the Metropolitan S. M. Co.. of which Alpheus Bull is President, and Peter Johnson Superintendont, will have 15 stamps. Another, by the Kohler S. M. Co., of which A. Staples is Superintendent, of eight stamps, with preparations for one of 20 etamps. Another of five stamps is being erected a short distsnce below the Kohler. General Page is also about erecting one of fifteen stamps, and several others are in contemplation.

Same of 14th: The Oasis has 10 stamps and eight amalgamating pans, and crushes nine tons of ore daily from the Eberhardt mine. The averuge product is now about $700. The ore is crushed dry, but not roasted, it being a chloride and easily amalgamated. We were shown a large bin of pulp worth $6,000 per ten. This ie too rich to be amalgamated conveniently and successfully hy itself, and is therefore mixed with pulp of a lower grade. A great amount of ore ie stored aheut the mill, enough to keep it running for half a year without calling for any from the mine. At the Moere & Parker mill the same condition prevails. The latter is of eight stamps, and reduces six tens of ore daily. The ore is also from the Eberhardt mine, which, from the easy manner it is mined, has accumulated far in advauce of the eapacity of the mills to reduce.

MILL AT HAMILTON.—Virginia *Enterprise*, April 15th: The 10-etamp mill of Mr. John McCone will start up on the 20th inst.; just 90 days from the day that work was commenced on the machinery of the mill at the Nevada Foundry.

OUTSIDE DISTRICTS.—*Empire*, April 10th:

GRANT AND TROY.—The Pacific M. & M. Co. will have a mill by July next. Andy McDonald is at work on the Blue Eagle in Troy, for an association of capitalists in San Francisco, who recently purchased the mine for $50,000.

The Poorman, Patriarch, and Ramshorn, are among the prominent ledges in Grant, and show rook impregnated with chlorides. The Blue Eagle is the most noted lode in Troy. They all constitute one general mineral helt.

PATTERSON.—Same of 14th: John M. Murphy, the Recorder of Pattersou District, says there have heen 225 distinct ledges struck, from one to twenty feet wide. The character of the country is the same as here—limestone formation. The country is finely wooded, and water can be got almost nuywhere by sinking. There are about 400 people in the district. The top rock assays from $50 to $2,000 per ton.

ROBINSON.—James A. Marschal, just arrived from Robinson district, brings very flattering accounts, and says they have an Eberhardt there, assays from which average $480 per ton, of top rock.

SILVER CANON.—Chisholm and Ramsdell returned to Hamilton yesterday, after an absence of 20 days through the ranges of mountains running in an easterly direction. They located a district about 110 miles from here, which they call Silver Cañon District. The ledges are numerous, and are found in granite and limestone formations. The ores look well, and one assay has already been made, indicating profitable yield.

ELY.—*News*, April 12th: The Ely is a base metal district, but the ore produces from 50 to 80 per cent. of lead, which contains from $200 to $800 in silver, and assays at the rate of thousands of dollars per ton have been obtained.

COOS BAY COAL.—A business letter from Empire City, Coos Bay, says: There are now in this port, loading with coal and lumber for San Francisco, one barkentine, one barque, four brigs and five schooners. The new steam tow-boat, Escort, owned by John Perschbaker, has arrived from San Francisco. She is said to be one of the finest tow-boats owned this coast. The coal mines formerly owned by J. Perschbaker have been purchashed by a company of capitalists of San Francisco, who intend to do a large coaling business.

RICH GOLD FIELDS have been discovered on the northern frontiers of Norway and Russia.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Traveling Agents.

WM. H. MURRAY, California.
DR L. G. YATES, California.
ISAAC G. STREET, Oregon.

Resident Agents.

OAKLAND.—W. B. Hardy.
CALIFORNIA AND NEVADA.—S. H. Herring.
SACRAMENTO—A. S. Hopkins, No. 70 J street.
WHITE PINE DISTRICT.—Alex. Bruckman, Hamilton, Nev.
HELENA, Montana.—E. W. Carpenter.
BLACK HAWK, C. T.—Harper M. Orahood.
CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.
GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.
DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.
CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.
OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.
Mr. A. C. Knox, is our only soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

San Francisco:

Saturday Morning, April 24, 1869.

Notices to Correspondents.

PYROTECHNIST.—Gun cotton may be prepared for small experiments, by the following method: Mix in a glass vessel 1½ fluid ounces of nitric acid (sp. gr. 1.45) with an equal bulk of sulphuric acid, and after the mixture has cooled, pour in upon 100 grains of fine cotton, contained in a Wedgewood mortar, and with a glass rod imbue the cotton as quickly as possible with the acids. As soon as the cotton is completely saturated, pour off the superabundant liquid, and with the aid of a pestle, rapidly press out as much of it from the cotton as possible. Then throw the cotton into a basin of water, wash it until it has not the slightest acid taste, afterwards dry by means of a gentle heat.

J. P., SILVER CITY.—Gutta Percha is obtained from the East Indies. You are correctly informed that it is most extensively used in England as outer soles for boots and shoes, and that it forms a most economical and durable material for that purpose. It is put on by cementing the old boot or shoe to the gutta percha sole, by means of a preparation of gutta percha dissolved in naphtha, which is sold at the shops, where the soles can also be purchased, thus enabling every man to be his own cobbler; an advantage that would be of some consequence in many remote mining localities.

STIBIUM.—Glass of antimony is prepared by partially roasting the tersulphuret of antimony (gray antimony ore) and subsequent fusion. There are several steps in the process that have to be carefully attended to in order to produce a good article. When the operation is properly performed the resulting mass will be found to consist of ter-oxide of antimony and some decomposed sulphuret. Well prepared glass of antimony is transparent; when held between the eye and the light it appears of a rich orange red or garnet color, but if imperfectly made, it presents a black and opaque appearance.

BLACK BEAR MINE, KLAMATH COUNTY.—We know of no machinery in operation in what is called the Eureka process, nearer than Mariposa County; there is none in this city at least, capable of working a ton for you as a test. The appliances for working by this process were sent to a mine in Sierra County about six months ago.

G. S. MELBOURNE inquires whether the Hagan Kilne Roasting Furnace is an "undoubted success," as stated in a California paper, and whether it is really true that the burning of hydrogen "carries off the base metals in a volatile form." We are informed that a report is about to be made, by a competent judge, on the recent tests which that furnace has undergone in Calaveras County. The base metals are certainly not volatilized.

CONTINENTAL Life Insurance Company, 203 Montgomery street, corner of Pine.

Shaking Hands by Rail.

As we write, probably not more than twenty miles of track remain to be put down, before the Central and Union Pacific Railroad Companies will clasp hands at the laying of the *last rail* that unites two oceans and completes the grandest engineering enterprise ever undertaken by man. The progress and final completion of this great work, in the presence of the waiting multitudes upon either extremity, has been most aptly referred to, as suggestive of the meeting of two friends, who have been long separated by distance and the various vicissitudes of life; and who, on approaching each other, extend their arms to full length, to perform that very common-place, yet most cordial greeting—the shaking of hands.

For many long months, and for years, the two armies of workmen upon the Central and Union roads have been toiling their way up steep mountain declivities and through deep and rocky cañons, leveling when practicable and surmounting when necessary, all offering barriers to their progress. Unlike hostile armies, these two great bodies of peaceful toilers are coming together, not with clashing swords and booming cannon to spread death and destruction at their meeting. Their mission has been to level a smooth highway over a vast continent for the peaceful occupation of commerce, and friendly salutations and most cordial greetings await upon either hand their welcome coming.

How difficult to realize that this stupendous work is so near completion; but a few days—nay hours, only,—are to intervene before the telegraph will announce to us that the last rail has been spiked, and that California has been annexed to the balance of the Union by indissoluble bands of iron.

As the welcome message will be carried east and west, literally with lightning speed, deafening screeches will go up from thousands of locomotives; as the news flashes by, every steam whistle, far and near, from one extremity of the Union to the other, will join in the screeching chorus—a fitting recognition that an uninterrupted way is open for the iron-horse from ocean to ocean, and from the southern gulf to the northern lakes.

For some weeks past it has been impossible to arrive at any definite information with regard to the point of junction between the two roads; and for awhile an unpleasant contest seemed to be waged between them, the result of which was watched with much interest. But, like two grand armies who have fought a great fight, and find nothing farther to be accomplished by a continuance of the contest, they have wisely suspended hostilities to properly reap the benefits and adjust the losses incident to the campaign.

The two companies having agreed upon Ogden as the point of junction, (the most proper and fitting place therefor), have now united forces, to close up the gap at the earliest practicable moment. Although the rails will be united, the work of completion will still remain to be done. Within a week or ten days, however, after the actual junction, we may reasonably expect to see a fair establishment of travel over the entire road, and look for regular mails from New York within seven days at the outside. In that event the recent irregularities in that branch of service will only be regarded as an appetizer to enable us to relish more heartily the utmost realization of the hopes of the most sanguine of the Pioneers of the Pacific Coast.

WET PROCESSES IN COLORADO.—Mr. John Agrell, a former chlorination pupil of Deetkin's, and manager of works of the kind in Amador county, has taken his departure for Colorado, for the purpose of introducing there some of the wet processes practiced in the Pacific States.

Mineralogical and Geological Notices.

ALUM IN SONOMA COUNTY.—We have to record this week another locality among those heretofore noticed in this State, where natural alum occurs. The Sonoma *Democrat* of April 17th, says: Our county seems to have nearly everything within its borders. Coal, copper, silver and gold have all been found. Last year a soap mine (steatite) was discovered, and now a mine of very strong alum has been brought to light on Hood's Mountain, about four miles from the Guilicos Ranch, between Sonoma and Santa Rosa. We have in our possession a piece from the mine, looking something like a quartz specimen, which tastes like strong, pure alum.

CHLORIDE OF SILVER DISSEMINATED IN LIMESTONE.—A small piece of massive crystalline limestone shown us by Mr. Foster, has chloride disseminated through the limestone, and so intimately incorporated with the substance of the lime mineral, as not to alter its uniform crystalline character, or appearance in any other manner than by giving it a tinge of brownish color—the rock assaying, according to Mr. Foster, not far from $100. Chloride seems to penetrate and discolor the limestone, according to this, in zones following cracks. Almost anywhere in Treasure Hill traces of this kind are said to exist. The piece in question was thrown away amongst the "cullings" of the Eberhardt.

WHITE CLOUD ORE.—Some very beautiful specimens including crystals of blue carbonate of copper (lasurite) are exhibited at No. 503 Montgomery street, amongst the rich gold, silver, lead and copper ores from White Cloud District, Nevada,—referred to in our last issue.

THE STATE GEOLOGICAL REPORTS.—A Cambridge correspondent, alluding to Prof. Whitney's labors, says:

"I know that he is hard at work on *three* books, and makes almost daily visits to the printing office. I always find him busy when I call. Like him better the more I get acquainted with him, and regard him as one of the strongest men in his line in the country—even if not at the very head of the list. His manner and style of lecturing is refreshingly different from our other University lecturers. He is more blunt, and less polished in the arrangement of his sentences, and his comparisons smack more of the rough life of the explorer than the sedentary confinement of the professor. * * * Our excursion (a geological party to the Rocky Mountains and California) is not completely planned, but we expect to start about the end of June, and get back about the 1st of October.

CONTRIBUTIONS FOR OUR CABINET.

No. 291.—*Cinnabar* from the Belle Union Quicksilver mine near Oakville, Napa Valley. Presented by Henry Rohling, of Gravel Pit. The ore is a beautiful light red, pure, crystalline, and is disseminated in segregated veinlets through the cretaceous country rock. The Santa Clara, Monte Diablo, Vallejo and Napa localities, besides a score of others where small quantities have been found, denote that the sources of quicksilver are very general throughout the cretaceous rocks of California.

No. 392.—*Cement gravel* from the ancient river channel, known as the blue lead, at You Bet, Nevada County; resting on and firmly cemented to a fragment of chloritic slate, the cementing material being iron sulphurets, showing the protoxide color. On exposure to oxygen the red color of peroxide soon takes the place of the bluish and greenish protoxide of iron. Whitney speaks of these channels a little indefinitely as pliocene, but the probabilities seem that they were not formed until the glacial epoch, which is usually considered as post-pliocene. The chloritic slate is much more ancient, dating from the jurassic ocean whose deposits constitute the field of the auriferous quartz veins. Presented by K. M. Brown & Bro., who have an 8-stamp water-power mill employed in crushing it.

No. 393.—A similar specimen from King & Bro's mine, Dutch Flat, showing gold on the smooth impression of a boulder. The smooth clayey surface showing gold which is so frequently noticed in the hydraulic mines, is always in place on the top or side of the boulder, while the dirt underneath is barren.

No. 394.—Gold quartz containing *zinc blende*, galena, and iron pyrites, from the "Lucky mine," Grass Valley.

No. 395.—San Bernardino asphaltum. It contains about 20 per cent. of petroleum, and is itself apparently a thickened petroleum, containing the less volatile and less fluid portions of the carbureted hydrogens that come to the surface, whose precise origin is yet in dispute, but is generally believed to be the natural distillation product of ancient vegetation, now enclosed in the rocks. It is solid, brownish black, of wax glance, and scarcely as hard as steatite, but the mineral is found from the hardness of "rock" to putty, and the condition of oozing streams, at the bottom of cliffs, passing into springlets of limpid oil. The supply of asphaltum from the quarries is said to be unlimited. There is no reason why it should not be shipped to San Francisco cheaply enough to pave every sidewalk in the city. Presented by Christy & Wise, of the Asphaltum Drain Pipe Factory on King street, between Second and Third.

No. 396.—Hornblende of the variety called *actinolite*.

No. 397.—Three shades of trachytic porphyry. From the east side of Monte Diablo, south of Clayton.

No. 398.—Beautifully variegated, veined, coarsely crystalline limestone, of a grey, brown, and white color, suitable for ornaments, pillars, table slabs, etc. Dry Creek, Alameda County.

No. 399.—Calcspar crystals, being very flat rhombohodrons, on limo and iron-rust incrustations. Hastings' copper mine, two miles south of Clayton, Contra Costa County.

No. 400.—Iron pyrites superficially deposited on a silicious decomposition product resembling pitchstone. Hastings' copper mine.

No. 401.—Indurated clay, resembling porcelain, from San Pablo Creek.

NAVAL.—We are pleased to learn that Jonah Hanscom, father of the Hanscom brothers of this city, and for several years naval constructor at the Portsmouth Navy Yard, has been ordered to the Mare Island Yard, in place of Melville Simmons, transferred to Portsmouth. Mr. Hanscom was formerly attached to the Mare Island Yard, and was the first United States Naval Constructor on this coast. The "Saginaw" was built under his superintendence. Since he has been at Portsmouth he has superintended the construction of not less than thirteen war vessels, one of which was the double turreted monitor "Agamenticus," which is mate to the "Monadnock," now at the Mare Island Yard.

PACIFIC RAILROAD CELEBRATION.—A call has been issued by the officers of the Mechanics' Institute for a convention, to be held on Wednesday evening next, to make arrangements for a celebration of the completion of the Pacific Railroad, All associations and organizations in the city and vicinity, are invited to send delegates. The convention will be held in the lecture room of the Mechanics' Institute, No. 27 Post street. The people of Sacramento are also making extensive arrangements for a fitting celebration of this important event. We presume the celebrations of the two cities will fall upon different days, so that those who desire to do so can attend both. Extensive preparations are also being made at Chicago and other Eastern cities for appropriate commemoration of this important event. We have elsewhere alluded to the manner in which the actual laying down of the last rail will be noticed in this State, and probably all through the Union.

California Academy of Sciences.

The regular meeting of the California Academy of Sciences was held on Monday evening last. Capt. Edward Pennix and L. A. Gould, of Santa Clara, were elected members, and Mr. Herman Simon, Mr. Segret Simon, and Mr. Eugene Evenstine, were proposed for membership.

Several saline incrustations from Mono Lake were received, as donations to the cabinet.

President Blake called attention to the stereoscopic views of Indian sculpture, which had been forwarded by Charles Crocker, Esq., of the Central Pacific Railroad. He said they looked as if they were made with some object, as there was a similarity between many of them; yet he thought they would be difficult to interpret.

Dr. Kellogg exhibited a singularly large and beautiful plant, very desirable for the florist, recently found by him on the San Joaquin river. It was a much larger and finer plant than either the *Leptosyne* or *Tuckermannia*, or their allied *genera*, with which it was nearly connected. He thought it would do away with those, and bring them all back to the old *Linean Coreopsis*. After reading a description of it, he proposed for it the name of *Coreopsis Californica*. He also found specimens of wild chicory, which might be used as an article of food as salad.

A letter from Mr. Stewart, of San Jose, was read, which gave an account of a remarkable exhibition of parhelia lately observed at that place.

Dr. Blake said the recent earthquake had not been noticed at Watsonville. He concluded that earthquakes were generally confined to one range of mountains at a time—sometimes along the Coast Range, and sometimes in the interior.

President Blake thought that hydrogen could be classed as one of the metals. It was known to lengthen wire by absorption, and when evolved from it by heat the wire would shorten.

After some further discussion on minor points the Academy adjourned.

A PLEA FOR THE BETTER SUPPORT OF THE SOCIETY.

It may not be improper, in this connection, to allude to a short communication in a recent number of the *Bulletin*, from the Corresponding Secretary of the Academy, Mr. Leo Eloesser, in which that gentleman makes an earnest appeal to the public for a better support for this institution. After alluding to the great benefits which have accrued to the world of science through the untiring and disinterested efforts of this association, and to the absolute necessity which is found for the existence of such societies, in order to the performance of that preliminary work through which alone all the splendid results of science are finally wrought out, for the benefit and enlightenment of mankind, Mr. E. says:

"Is it not the plain duty of society to aid such an institution in the pursuit of objects most vital to the interests of whole communities? Should not they who acknowledge the importance of such an undertaking, and who enjoy all the fruits of its success, be willing to contribute a trifle to the working expenditures of that undertaking? Whilst even in this community, where time is money, men of ability and considerable attainments have ungrudgingly given their time and labor to the increasing demands of the Academy of Sciences and its objects, it is but reasonable to expect that an enlightened public will comprehend the propriety of taking henceforth such an interest in the welfare of the Academy as will lessen at least the pecuniary burden which rests upon its active members. The expectations of the Academy in reference to the public are at least not extravagant. The public are only invited to join the Academy in the capacity of paying members, and by contributing a trifling monthly fee, enable the working members of the Academy to publish their observations and discoveries, and make them useful to the whole community. No scientific qualification is required of those who apply for membership, and those who are ever willing to learn will always find an opportunity to do so at the meeting of the Academy and at their occasional lectures, and the publications gratuitously given to the members."

GRAFTING WAX.—The Nevada *Gazette* gives the following recipe: Four parts of resin, two of beeswax, one of tallow, melted together. If to be used in cold weather, add a half more of the tallow.

Resources and Developments.

GOVERNMENT LANDS.—The amount of Federal land open to purchasers in this State is rapidly decreasing. Within the last five years not less than 12,000,000 acres has been set apart as railroad grants, although only about 1,000,000 have as yet been surveyed and located. The State has also, under a general Act, become the owner of some three or four millions of swamp and overflowed lands. There is now left in preëmption only about 40,000,000 of good agricultural lands, which are being rapidly taken up, mostly in the San Joaquin and other counties to the south of this city. Lands which have been used chiefly for grazing purposes, and which three or four years ago were not worth ever $1.25 per acre, are now in demand at from $5 to $10. The extraordinary agricultural developments of the last few years, and the approaching completion of the Pacific Railroad, with the anticipated increase of immigration, account for the extraordinary increase in prices. The above enumeration of lands is exclusive of the mineral belt, which includes all that portion of the Sierra Nevada which lays, say 500 feet above the level of the sea; much of which has been proved to be very valuable for agricultural purposes, and which is now beginning to be sought for, through titles from the various railroads and from the Federal Government.

THE BERRY CROP promises most abundantly the present season; also stone fruits, cherries, peaches, apricots, etc., will be abundant and cheap. Our Atlantic friends, who may visit us the coming season, may depend upon enough and to spare of the most delicious fruit which the world can produce. Strawberries are already becoming quite plenty in this market at thirty cents per pound.

A SAWMILL AT WHITE PINE.—A party which lately purchased a sawmill at White Pine for $18,000, is reported to be clearing $800 per day, clear of expenses. That is not a bad mine.

GRAIN ELEVATORS.—The Vallejo grain elevator, the first upon the Pacific coast, is fast progressing toward completion. It is intended to have it in readiness to handle the first grain of the incoming crop which may reach Vallejo.

In connection with the above we may again allude to the fact that Mr. A. Hayward and other San Francisco capitalists have recently purchased all the water front from the foot of Montgomery street to Powell, and propose to erect thereon docks, grain elevators, etc. The proposed Stockton street improvements have been suggested in connection with this heavy purchase. A grain elevator, above all other improvements, is one most needed in this city. The present mode of handling grain in this State is a direct tax on the farmers, several times greater than all other taxes, national and State put together. Whatever will cheapen the cost of handling grain enables buyers to give a larger price to farmers for it; hence we look upon the proposed introduction of elevators as a marked advance in the development of the resources of the State.

SILK CULTURE.—Increased attention appears to be directed toward the production of silk, especially in Los Angeles county, where nearly 1000 acres have been planted with mulberry the present year. This will be equivalent to about three million cuttings. Mr. Newman estimates the value of this year's crop of cocoons, for that county alone, at $40,000, allowing seventy-five cents per pound. The silk, after reeling, will be increased to the value of $125,000. The next year's produce is estimated at a ten fold increase. The first mulberry trees for silk growing in that county were set out in 1867. Last year but three acres were occupied with the mulberry—the three has increased in one year to nearly 1000.

THE CULTIVATION OF FLAX is also attracting increased attention. A tract of 250 acres has been sown by Mr. W. D. Perine, on the coast, some twelve or fifteen miles below this, and not far from Half Moon Bay. This, we believe, is the largest single tract yet placed under flax culture on this coast. Heretofore the culture of this plant has not been profitable in this State, from the fact that there has been no market for the fibre; the seed, alone, will not pay. Hereafter, however, the Oakland Cotton Manufacturing Company, which is fitting up their mill with machinery for manufacturing flour and other sacks from flax, will be able to purchase all that will be raised for several years to come. Mr. Perine proposes to prepare the fibre by the process of "half dressing," by which the flax is rotted, broken, and freed from most of the wood, and which he thinks will cost only about $25 per ton, while the material so prepared will be worth $75 per ton, leaving a profit of $50 per ton, in addition to the sale of the seed, as the net profits of the crop. These figures may be somewhat exaggerated; but there is no doubt a fine field here presented for a limited culture of this product.

CLIMATE OF PUGET SOUND.—There has not been a particle of snow at Port Townsend, Puget Sound, during the past winter; and ice has not made over one-fourth of an inch thick. The grass has been green all winter, and wall-flowers, pansies and daises have been in constant bloom. This locality, it should be recollected, is above the 48th degree of latitude—a point nearly an entire degree north of the most northernmost point of the State of Maine. Our Eastern readers will, no doubt, be greatly surprised at the above fact. Port Townsend is in what was the extreme northwestern corner of the Union previous to the purchase of Alaska.

LUMBER AT WHITE PINE.—A load of lumber recently sold at Shermantown for $300 per thousand feet.

ROAD IMPROVEMENTS.—The Salinas and Pajaro Turnpike Company has been invested with necessary powers by the Supervisors, and the road will speedily be ready for use. Good roads are an indispensable requisite to the development of any country, and the construction of such, everywhere, should be regarded as important steps in industrial progress.

San Francisco, April 19, 1869.

MESSRS. DEWEY & CO., Patent Agents.—*Gentlemen:*—Allow me herewith to tender you my sincere thanks for the efficient assistance you have rendered me in securing my patent, and other papers, as well as the promptness and energy displayed by you in our business transactions. Very respectfully yours, C. E. JAYCOX.

RETURNED.—Dr. J. B. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18-6m B. F. HOWLAND.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 6v18-3m

PAIN KILLER!

The Great Family Medicine of the Age. Taken internally, it cures
Dysentery, Cholera, Diarrhœa,
Cramp, and Pain in the Stomach,
Bowel Complaints, Painters' Colic,
Liver Complaints, Dyspepsia and Indigestion,
Sore Throat, Sudden Colds,
Coughs, etc., etc.
Used externally, it cures
Boils, Felons, Cuts,
Bruises, Burns, Scalds,
Old Sores, Sprains, Toothache,
Pain in the Face, Neuralgia,
Rheumatism, Frosted Feet, etc., etc., etc.
The Pain Killer is sold by all Druggists and dealers in Family Medicines.
KENDRICK & CO. and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents. 4p1m

PACIFIC
Rolling Mill Company,
SAN FRANCISCO, CAL.
Established for the Manufacture of
RAILROAD AND OTHER IRON
—AND—
Every Variety of Shafting,
Embracing ALL SIZES of
Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames
—ALSO—
HAMMERED IRON
Of every description and size.
☞ Orders addressed to PACIFIC ROLLING MILL COMPANY Post Office, San Francisco, Cal., will receive prompt attention
☞ The highest price paid for Scrap Iron 9v14-3m9p

PROSPECTUS
OF THE
HOMESTEAD FARM
ASSOCIATION.
This Association proposes to dispose of
50,080 ACRES
Of the finest Agricultural Lands in the State of California by dividing the same into
313 SHARES,
—or—
160 Acres Each,
Payable in THIRTY-SIX equal Installments, of $25 each,
Payable Monthly, Without Interest.

The land is situated in Kern County, on the southwest of Tulare Lake, and extends to the foot-hills on the west. Every acre of the above land is so situated that there is no waste, and can be plowed in one body if desired. Water can be had at from twelve to twenty feet on any part, while wood exists in abundance in the foot hills. The west bank of the lake is high and the country is free from malarious or climatic fevers, and offers to the enterprising settler an opportunity for procuring a home upon easy terms,

The projected branch of the Southern Pacific Railroad passes through the entire tract, and will, without doubt, be completed by the time the land will have been paid for by the shareholders.

TITLE, U. S. PATENT.

Maps of the land will be ready in a few days. The Books of Subscriptions were opened at the office of
KURTZ & SHAEFFER,

A NEW SLUICE
For Concentrating Gold, Amalgam, Sulphurets or Black Sand, in Quartz Mills,
OR PLACER MINES.

It is made without iron work, is cheap, durable, and effective; can be made by any good mining carpenter at the mine or mill, of sizes to separate the Sulphurets from one to fifty tons of sand per hour. There is no expense for motive power, or to handle the sand, if it can be run from the mine or mill directly into the receiving sizing boxes by means of water. It is continual, self-discharging, and can be used for concentrating fine gold and black sand, on the river bank or ocean beach. They may be seen at work in the American Company's Mine at North San Juan.
For information how to construct, and the cost, address
ORLANDO JENNINGS,
17v18 North San Juan, Cal.

Crucibles.
The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.
THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.
On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,
1v18-3m9p 519 Front street, San Francisco

To White Pine Owners and Others.
Abstracts of Titles to Mining Claims, Town Lots and Lands furnished, Mines examined and reported on by a competent person now residing in Treasure City. Mining Claims, Town Lots, etc., bought and sold on commission. For information apply to BIBLEMAN & CO., 605 Montgomery street. 15v18-1m

THE MINING AND SCIENTIFIC PRESS has entered upon its XVIIth Volume. It has donned a new-style hat; or, in newspaper parlance, a new heading, which gives it the solid, scientific look it merits. Other improvements typographical are also noticeable. No call for improvement in its matter.—*Amador Ledger, July 18th.*

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Chaleenge Pumps, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first-class work, and we intend to do no other.

GODDARD & CO.

Railroad Items.

LUMBER BY RAIL.—A NEW RAILROAD PROJECT.—The Stockton *Independent* says that in view of the growing demand for lumber, the rapid diminution of timber in the redwoods, and the constantly increasing difficulty of obtaining a supply from Oregon, a number of men have under serious consideration the project of reaching the most accessible and heavily wooded regions of the western slope of the Sierra Nevada Mountains by railroad. The proposition is (and it is quite a feasible one) to construct a road from the neighborhood of Fletcher's sawmills, or a point say ten miles east of Sonora, Tuolumne County, pursuing a course westward along the lowest lands between the Stanislaus and Tuolumne rivers, crossing the San Joaquin River at the most available point in Stanislaus County, and connecting with the Western Pacific Road at or near Livermore Pass. In the neighborhood of Fletcher's mills the lumber is as good as can be found in the world, and the supply is almost inexhaustible. It is estimated that were a railroad constructed to that point, not less than three hundred millions of feet of lumber would be carried over the road annually; and that amount yearly could be procured near the eastern terminus of the road for ten years to come without much difficulty. So earnestly is this project under the consideration of mountain lumbermen, that they propose to grade the road and supply the ties and necessary timbers and take stock in the enterprise for their remuneration. That part of the road west of the line of the Stockton and Tulare Railroad survey, would be wholly obviated, should the Stockton and Tulare Railroad be built as now contemplated.

The plan of relying largely upon subscriptions of material and labor to be paid for in stock, as set forth in the *Independent*, is a good one. Capital of a kind which the sturdy sons of toil in the mountains possess in abundance, will thereby be converted directly into railroads, without intervening fat contracts to eat up a large portion of the same, and thus increase the cost of the road to those who are able and willing to subscribe money instead of labor. This is a new feature of associated labor, which we would rejoice to see carried into practice. A road such as here proposed would no doubt prove a highly remunerative investment,—and furnish a new source of lumber supply for this city, the want of which has been so greatly felt for the past two or three years.

INCREASE OF TRAVEL WITH RAILROADS.—But a short time prior to the construction of the railroad which connects Philadelphia with Pittsburg, three stages a week furnished sufficient accommodation for all the travel between those two important cities; but as soon as the railroad was completed, the cars were crowded with passengers. Railroad facilities, above all others, are best calculated to develop the resources of a country and fill it up with a thriving population.

RAILROAD BRIDGE AT PETALUMA.—The work of bridging Petaluma Creek, for the railroad, according to the *Argus*, was to have been commenced on Monday last. The location of the depot is just now a matter of considerable interest.

THE WESTERN PACIFIC.—Work on this road in the neighborhood of Stockton, and at the tunnel is progressing as rapidly as the nature of the ground and the limited amount of labor now attainable will admit.

IMMIGRATION.—It is said that the emigrating population of Ireland is about exhausted, while that of Germany promises to be an ever overflowing population. Last year 140,000 German emigrants arrived in New York against only 48,000 Irish. Emigration from the former country will doubtless increase annually for many years, while that from the latter will as steadily decline.

CALIFORNIA LAND CASES.—Sixty-nine California land cases have been adjudicated in the Supreme Court—thirty-six have been rejected and thirty-three confirmed.

Mining Items.

GLOBE GOLD AND SILVER MINING CO.—From Mr. Winchester's (the President's) advertisement in the New York *Tribune*, we observe that this property, situated on Monitor Creek, in Alpino County, a mile east of the main Carson, and consisting of 2,000 feet on the Hercules lode, besides 600 feet on the Abe Lincoln lode, is being opened by a tunnel which is now in 150 feet, and which has cut several smaller veins of value; having 150 feet more to run. The Hercules, says Mr. Winchester, "is the Central or mother lode in a mineral belt, two miles wide, the richness of which in silver, gold and copper, has no parallel in California or Nevada, when the abundance of the ores is considered."

That gentleman furnishes occasional articles on mining to the *Tribune*. He regards White Pine as epidemic to a considerable degree, and furnishes many good points in favor of regular and legitimate mining.

THE GOLD MINES OF SCOTLAND.—The excitement with regard to the gold mines in Scotland, recently noticed in our columns, appears to be dying away. The mines don't pay as well as was anticipated, and the number of miners is steadily decreasing. A great many have not collected the value of $1.25 per week; although some of the more experienced, and perhaps more fortunate, have realized as high, sometimes, as $3 a day. Sluices, as well as rockers and other modes of washing the auriferous sands have been introduced.

REPORT OF THE COMMISSIONER OF MINING STATISTICS.—Fifteen thousand copies are to be printed. An appropriation has been made for the continuance of the work. The Commissioner will therefore again take the field during the ensuing summer.

NORTH CAROLINA furnished all the gold of the country for twenty years.

GRAMME.—The *American Journal of Mining* raises its voice against the cutting down the word *gramme* to *gram*, in accordance with the Websterian rage for abbreviation and simplification,—and urges, with force, that *gram* looks, in a careless manuscript, too much like *grain*.

CALIFORNIA
Marine Metallic Paint.
This Composition, the result of scientific and chemical research, after having been thoroughly tested for the past twelve months, is now offered for sale by the "California Marine Paint Co." incorporated March 25, 1869. The experiments to which it has been submitted, have proved that it is one of the most valuable discoveries of this wonderful age of invention. It has been extensively used in painting the bottoms of all kinds of sailing vessels, wood, iron and copper, and with invariable success. Wooden bottoms, piles, etc., are thoroughly protected from the destruction of the *toredo navalis*, or sea worm; and iron vessels effectually preserved from the adhesion of barnacles, grass and all descriptions of zoophytes, no injury whatever resulting to the plates, as frequently occurs from the use of copper, and other pernicious paints; but, on the contrary, its known properties will preserve them.
By the use of this Paint, copper ing vessels is rendered unnecessary; but where a vessel has been coppered it will not only keep it from fouling, but preserve the copper from the ordinary wear and tear, amounting to 10 per cent. per annum, and render it almost indestructible.
It is also invaluable for the preservation of all wooden structures, especially railroad timbers, bridges, floor beams in houses, telegraph posts, and is a certain preventive against the action of the white ant and cochineal of Mexico, China, and India.
The company are now prepared to supply all orders, and enter into contracts for the application of this Paint.
Orders and communications in regard to terms, addressed to Capt. R. H. Waterman, President; James Pollock, Superintendent Dry Dock; or L. L. Bullock, Tide Land Commissioner, will receive prompt attention.
R. H. WATERMAN, President of Company.
LLOYD TEVIS, JAMES POLLOCK, L. L. BULLOCK, SCOTT TIDBALL, THOS. A. TALBERT, JOHN S. ROLLS, } Trustees.

A. DE LAND, CARL FRECHT, THOMAS ANSBRO, LOUIS COHN, W. S TAYLOR.
This Company offer to the public One Thousand Shares of the Capital Stock for a Working Capital, at the subscription price of Five Dollars per share—FULL PAID, and NEVER liable to any assessment whatever. The mine is admirably located for working, being situate on Argyle Hill, opposite Treasure City. Shaft sunk 10 feet, showing a large body of chloride, which assays $700 per ton, and which will now mill $200. The capital raised to be used and expended on the mine. The standing and reputation of the Trustees is ample guaranty of responsibility, etc. Maps and samples of ore, and subscriptions at the office of the Company, Rooms No. 15 Stevenson House, corner California and Montgomery, and at 211 and 213 California street, near Battery street. 16v18tf

ILLINOIS
SILVER MINING COMPANY
White Pine District.
Trustees:
JAS. H. CUTTER, E. H. SHAW, B. H. FREEMAN, JAS. R. CARNISS, DAVID BUSH.
The Company's Mine adjoins the celebrated "Silver Glance," and is in close proximity to the "Argyle," and other prominent mines of the District.
From developments already made, the Trustees feel justified in saying to their friends that this is one of the best opportunities ever offered for investment in this State.
For the purpose of further developing the mine, the Company has set aside a limited amount of stock, to be sold as a working capital, of which they now offer 1000 shares, at the nominal price of $2 50 per share, unassessable—the entire proceeds of which will be devoted to developing the mine.
The books of the Company are now open for subscription at the office of the Company, No. 432 Montgomery street, Room No. 1, first floor. By order,
JAS. H. CUTTER, President.
O. W. STEWART, Secretary.

Agricultural.

The Philosophy of Hay Making.

Among many farmers there is considerable inquiry as to the proper time to cut grass for hay; while others appear to think that the convenience of the proprietor or the supply of help is of more importance, than the difference in the nutritive condition of the crop, within a range of a few days or even weeks. Acting upon the old proverb that "the proof of the pudding is in the eating," quite a number of intelligent farmers have, from time to time, made careful camparative experiments as to the result of feeding early and late cut hay; and it has thereby been proven that the value of a ton of hay, cut while green and succulent, and cured in the right manner, contains from 15 to 20 per cent. more nutritive value than that which has been cut after the seed has become fully developed.

Farmers have not, however, been altogether satisfied with mere *experiments* in this direction; but many of the more inquiring and progressive among them have called in the aid of the chemist and scientist to learn why these things are so. A very slight examination into the philosophy of the production of grasses, shows that all annual plants reach their largest growth when in full bloom. No additional fibre or nutritive quality is added to their bulk after that time; the putting forth of the bloom is the last stage of growth. The strength and vitality of the plant is at this time equally distributed through all its parts, and its entire after effort is expended in ripening the seed. In accomplishing this, it simply exhausts itself, and nothing is extracted from either soil or atmosphere. The strength and vitality of the plant gradually leaves its other members, until it has nearly all centered in the seed. In corn, wheat, harley, etc., which are raised exclusively for their seed, this is the end desired; but grasses, or even grains, when the design is to feed in the straw, should be cut at the precise time when the nutritious matters of the plant are most universally diffused throughout its entire bulk; which, as we have shown, is just at the point of full bloom, and before the seed begins to form.

The common practice in cutting grass is to wait for the formation, but not fully ripening of the seed; partly for the reasou that at that time the grass is more readily cured, and partly under the supposition that while nutriment is added to the seed, none is lost from the other portions of the plant. The error of such a course is apparent from what has already beeu written.

The chemist farther tells us that all grasses contain a notablo quantity of sugar in their stalks and leaves when in bloom. If the plaut is cut before it comes into bloom the sugar has not been formed; if it is cut after the sced has set, the sugar is not there at all—it has been converted into woody matter which contains no nutriment—but merely aids digestion by means of its bulk.

In *curing* hay there are also many things to be considered, and the farmer owes much again to the chemist for the interesting and valuable information he has obtained through him, with regard to the chemical changes incident to the plant during that process. Most farmers make the same mistake with hay making that they do in the handling of manure—they turn it over and over too much to the weather, thereby unnecessarily losing much of the most valuable properties of both.

Don't dry your hay too much; good grass may he dried until it becomes as worthless as straw. Hay should be simply *wilted* in in the sun and dried in the winrow. When we gather an herb and desire to retain its full strength we dry it as quickly as possible, and in the shade. Such is the philosophy of haymaking—dry as quickly as possible, with as much stirring as you can give it, and for the shade, substitute as soon as thoroughly wilted, the winrow and the cock. Any unnecessary delay of "raking up," even for a single hour, in a very hot day, may make a difference of fully fifteen per cent. in the value of your hay. The water only should be evaporated. When that is gone, the aroma and nutritious properties of the grass will speedily follow if further exposure is suffered. The olfactory nerves will promptly give notice when that process commences, and no time should he lost in "raking up," after the aroma is observed to be passing away. If the weather is hot, and the ground dry, the grass will he ready for the rake in two hours after it is down—even when the weather is cold and the ground wet, not more than half a day should he allowed for wilting and drying broad-cast. Hay should he placed in the stack or harn as soon as possible after it is made—not an hour's unnecessary delay should be permitted.

The chemist, to whom we must always look for the philosophy of such things, tells us that with the evaporation of the water the organic cells of the plant are broken up and active fermentation sets in, unless it is immediately placed under cover from the sun. When such fermentatiou takes place, the hay depreciates in quality, and is in a condition to heat when afterwards placed in the stack or barn. An undue fermentive change may he known by the rapid loss of color. As long as the green color is retained, the work is going on all right. Its loss, whether in the field or in the stack, shows that injurious fermentation has set in.

Heat, light and dry wind will take the chief part of the sugar and starch (its most important nutritious qualities) out of hay, in a very short time after it has lost sufficient water to become wilted. The subsequent exposure to even a very slight rain will render it almost worthless. When all the conditions of cutting and curing are properly complied with, the cured hay retains all the characteristics of green grass, without its injurious drawhack of excess of water. The dried and condensed juices remain iu the tender fibre, in just the condition to he most easily softened and digested.

The true philosophy of hay making, then, consists in cutting the grass at the precise time when the sugar and starch is most fully developed, and before those elements are converted into seed or woody fibre; and in curing the same to just the point previous to which excessive fermentation takes place, and when it is in just the condition to he put into the barn without danger of subsequent heating.

THE LATE RAINS of the present season have ensured good crops throughout the State. The total fall to the present time is 20.50 inches; the average fall for the past eighteen years is 20.79, hy Dr. Gibhons' record, although some records make it as high as 22 inches. The present season has been remarkable, however, for the evenness and timeliness of the rains—a most important consideration iu connection with utilizing the water, whether for farming or mining. No decidedly unfavorable reports have been received from any part of the State or adjoining regions, on this coast, although in a few circumscribed localities some slight damage has been done by the "lodging" of the wheat, during the late heavy rains.

Colusi County reports three times as much grain sown as on any previous year, and all looking admirably well. Much of this is on land that was considered almost worthless three years ago.

From the San Joaquin accounts are especially favorable. Between Stockton and Firebaugh's Ferry, nearly 100 miles, there is a strip 20 miles wide, but little of which has heen cultivated before, and now grain covers three-fourths of it. The dwellings are cheap, orchards and gardens few, fences are s arce and loose cattle entirely wanting. This year's crop, it is estimated, will pay for the land on many of the farms.

The Monterey *Democrat* reports the crops in that region in a most favorable condition, and likely to be earlier than last year by at least two weeks.

In Santa Barbara the main crop is corn and beans. Much more land has been planted there this year than ever before, not only in corn and heaus, hut in wheat, barley, and potatoes as well. That region is fast improving in building, fencing, planting orchards, and in agricultural progress generally. It is claimed that the almond will flourish better there than in any other part of the State. Messrs Clough & Olmstead are planting a large orchard of almonds. The olive, too, is receiving much atteutiou there, and it is thought its cultivation will he found very profitable. Many farmers are planting the English walnut. It is a somewhat remarkable fact, and one altogether inexcusable, that this county should derive almost its entire supply of flour from this city and Oregon. There is no flour mill in the conuty; one is greatly needed and would do a good husiness. There is no reason why that county should not raise all its own wheat, and some to spare. A few farmers are just beginning to grow whea'.

New Mining Advertisements.

Bowden Silver Mining Company. Location of works: White Pine, White Pine County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourteenth day of April, 1869, an assessment of fi e cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, 419 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty ninth day of May, 1869, shall be deemed delinquent, and will he duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourteenth day of June, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sallo. By order of the Board of Trustees.

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skillful application of their suitable principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.

Sold by packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.

Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

J. M. RUFFINGTON,

Room 37, New Merchants' Exchange, California street San Francisco 17v15-tf

Pacific Protective Association of California.

INCORPORATED OCTOBER, 1868.

PROSPECTUS.

OBJECT.—The object of this Association is to secure a cash payment, within sixty days after the death of a subscriber, to his or her heirs or assigns, of as many dollars as there are individuals of the class to which said deceased subscriber belonged.

MANAGEMENT.—The subscription fees are Ten Dollars at joining, and One Dollar on the death of each subscriber. The One Dollar from each subscriber is paid to the heirs or assigns of the deceased.

THE FUNDS.—The By-Laws of the Association require that a portion of the money received as subscription fees shall be a Sinking Fund to meet assessments falling due by the delinquencies of subscribers. The balance of the money received to be used for the payment of the expenses incurred by the Association.

MEMBERS.—A subscriber failing to pay his or her assessment of one dollar within Thirty days from receipt of notice forfeits his or her Certificate, and all claims upon the Association, unless good cause is shown for further delay. A subscriber can forward money in advance which amount will be credited on future assessments. The subscribers are divided into classes including males and females. Each class is limited to 5,000 subscribers. As classes are filled, new ones will be formed. No person is to enter that he cannot pay Ten Dollars at joining and One Dollar occasionally, thus securing $5,000 to his or her heirs or assigns.

ADVANTAGES.—The advantages of this Association are, that no *money panic* can affect it. Its benefits are easily obtainable by all, and every subscriber added to the Association enhances the interest and protection of all; the amount paid being so small, and only at long intervals, that any person can secure for his family a competency upon his death.

CLASSES.—In Class A, all persons between the ages of 15 and 40 years; in Class B, all persons between the ages of 40 and 60 years.

Any one that has not stated his or her age correctly, will forfeit all money paid and his or her Certificate.

One class cannot be assessed if one of another class dies. Classes have no connection with each other.

HOW TO BECOME A MEMBER.—A person desirous of becoming a subscriber must fill out an application, and forward with it Ten Dollars by Check, Draft, or by Express, in gold or silver coin. Persons can pay agents, when regularly appointed and authorized to receive money. Each subscriber should interest himself in obtaining new members, by so doing all are benefited.

BOARD OF DIRECTORS.—Benjamin H. Freeman, George H. Russell, Samuel A. Raymond, James A. Pritchard, W. Le Roy.

OFFICERS.—Benjamin H Freeman, President; George H. Russell, Vice President; John H. Warren, Secretary; James A. Pritchard, Treasurer.

REFERENCES.—Hon. Henry Dutton, President of Farmers' and Mechanics' Bank; Hon. Samuel Cowles, late Judge County Court, San Francisco; Hon. A. L. Gunnison, Attorney at Law, San Francisco; H. J. Booth, Esq., Union Iron Works, San Francisco; Henry F. Williams, Esq., Real Estate, San Francisco; John G. Hanscom, Esq., Ætna Iron Works, San Francisco; John H. O'Brien, Esq., of O'Brien, Bush & Co., San Francisco; Hon. J. P. Jones, Gold Hill, Nevada.

Machinery.

VARNEY'S PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ores are reduced to an impalpable powder, and the metal amalgamated.

Setlers are de on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

PATENT
Boiler Scraper and Tube-Cleaner.

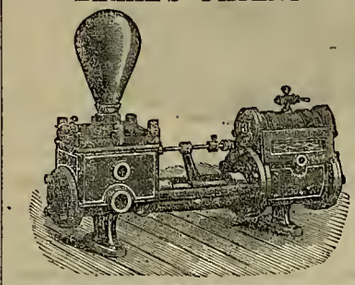
IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.

A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.

For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. D., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

BLAKE'S PATENT



STEAM PUMP!

This Pump is warranted superior to any in the market, for Breweries, Sugar Houses, Tanneries, Boiler-Feeders, Steamboats, Mining and Fire Purposes, etc. It throws a full stream of the thickest beer mash without clogging, and sugar syrup boiling hot without difficulty.

Warranted a positive Pump under ALL circumstances; it never stops nor gets out of order, and by reason of the patent device in the valves, is kept clear and always ready for action. It is SIMPLE, COMPACT and POWERFUL, and needs no expert to run it.

☞ If one fails to do the work for which it is sold, it may be returned and the money will be refunded. May be seen in operation at Risdon's, or Union Iron Works, or at

W. O. M. BERRY & CO'S,
Agents for Pacific States,
8v18 3m 114 California street, San Francisco.

Avery Pump and Tube Well.
Complete for Use.

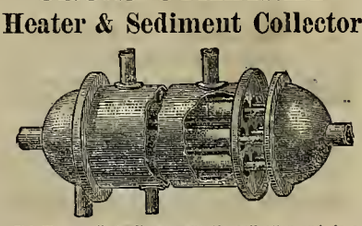
The TUBE WELL is formed by driving prepared iron piping into the ground with a sledge. Although of comparatively recent invention, these wells have won a world-wide reputation, and are proven to be superior to the ordinary dug well, costing sometimes less than one-fourth that of others, and at the same time excluding the surface water and dirt. The tubing is coupled together in lengths of about six feet, as they are being driven into the earth; the valves are then dropped in and the Pump screwed down on top.

FORCE AND LIFT PUMPS

Always on hand For ease of Working, durability and force, the Avery Pump has no superior. For circulars, etc., address Postoffice box 17.

UHRIG & DEWEY,
13v13tf 318 Pine street, San Francisco.

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., of San Francisco, Keep & Bargion, of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to WM. B. CROSS,

Engineering.

Submarine Engineering and its Modern Practical Adaptation.

The New York Society of Practical Engineering held its regular meeting on Tuesday evening, March 16th, the President, James A. Whitney, in the chair, the subject for discussion being "Submarine Engineering and its Modern Practical Adaptations."

The regular paper of the evening read on this subject was by Wm. Robinson, A. M., Professor of Sciences, Spring Valley, N. Y. The paper opened by calling attention to the importance of the subject as shown in a variety of operations in which submarine skill is requisite, such, for instance, as in establishing submarine defences in time of war, and in time of peace in removing obstructions from channels and harbors, in laying the foundations of piers and sea walls, and in the recovery of rich treasures and valuable property lost in sunken vessels. Before the introduction of diving bells, submarine operations were very limited in extent and were carried on by means of professional divers who could remain under water only while they held their breath. Aristotle makes some allusion to a "kettle" used by divers, but the earliest authentic account of the use of the diving bell in Europe, refers it to 1538. In this year two Greeks descended under water carrying a burning light with them, at Toledo, in Spain, in the presence of Charles V and several thousand spectators, and came up perfectly dry. For a long time diving bells could be used only at very limited depths. A column of water thirty-three feet high is equal to the presence of one atmosphere, consequently at this depth the bell was half full of water, and at greater depths the pressure of water was still greater, consequently the bell was entirely unsuited to deep water diving. The diving bell was of comparatively little practical value until a means was devised for replenishing it with fresh air, both for the respiration of the divers, and as a means of keeping the water out of the bell. The first noteworthy plan for accomplishing this result, was devised by Dr. Halley, in 1715. His method was to sink barrels freighted with fresh air to the bell. Nevertheless, practical operations were performed with the diving bell as early as 1642, and in 1687 an American named Wm. Phipps succeeded in recovering from a Spanish wreck sunk on the Bahamas the sum of $1,500,000. Of this he received $80,000 for his own share; he also received the honor of knighthood from Charles II. In 1776, Mr. Spalding, of Ediubnrgh, made an improvement on Dr. Halley's bell. This improvement consisted in placing the control of the bell, the power to move up and down, and laterally, in the hands of the divers themselve, instead of with the operation above. The next marked improvement was the introduction of the condensing air pump for the purpose of forcing air into the bell for respiratiod. The air pump was used in 1779 by Mr. Smeaton. It is also generally conceded that he was the first to apply the diving bell to regular engineering purposes; he used one made of wood in 1779, in repairing the foundation of bridges over Tyne at Hexham, in Northumberland. He used a metal diving bell also in 1788, in raising large stones from the water, and building a submarine sea wall in Ramsgate harbor. Sir John Reussie improved the diving bell for engineering purposes, and the distinguished engineer Brunel used a bell in the construction of the Thames tunnel. He also developed the fact that a person can live much longer with a given supply of condensed air than of air non-compressed. The writer then noticed the various improvements of later times. Among these was noticed the "Nautilus," pateuted by Major Sears. This apparatus is fitted with chambers to contain condensed air and water ballast for the purpose of controlling and regulatiug the various movements of

the bell by changing its gravity. Prof. Maillet proposed a plan which has been very successfully used in repairing submarine foundations in the waters adjacent to New York. The apparatus now at work on the wreck of the frigate Hussar, sunk in revolutionary times near Hell Gate with £900,000 sterling, in George III guineas on board, is claimed to be an improvement on all bells preceding it. It is called the "Submarine Explorer," and is the invention of Wm. Montstorms. It is claimed that it withstands the force of the strong current running over the wreck most of the time. Another apparatus invented by a civil engineer of this city, was described in closing. The inventor calls it a "Combination Diving Bell and Boat." Near the bottom of the apparatus is a ballast chamber for holding both water and solid ballast. It has also a "working compression chamber" and a "safety compression chamber," both containing condensed air. The boat is sunk or raised by admitting water into or expelling it from the water-tight compartment. The solid ballast is thrown overboard in case of emergency; the water is expelled by letting in the compressed air of the working compression chamber upon the water in the ballast chamber. There is also a tubular projection from the bottom of the boat designed to be sunk into the bottom of the river by excavating from within. When it is designed to excavate deeper than the length of this air-tube, a movable pneumatic tube is used, into which a man enters from the top and proceeds with the work of excavation. As he proceeds the tube is gradually sunk down by pulleys and ropes from the outside. The water is forced out by air from a tube which also supplies air for respiration.

LEVEEING THE INTERIOR TOWNS.—Marysville and Stockton have been compelled to follow the example of Sacramento, in leveeing themselves thoroughly against the inroads of the mountain floods. The Marysville levee was completed a few months ago, and Stockton, we observe by the *Independent* of the 8th inst., is now employing Captain C. M. Weber in surveying and superintending the construction of a levee along the eastern side of the city. There are twenty-five teams and a large gang of men removing earth from Mormon Slough and enlarging the channel. For a distance of seven or eight blocks along East street, (five blocks east from the railroad line), the contractors have plows at work, and have commenced hauling earth to the grade. The object is to enlarge the canal on the east side of East street, deepen the channel of the same, and thereby more effectually guide the water to Mormon Slough and prevent it from flowing into the city. The small canal constructed by Captain Weber along North street, extending from near East street almost to Rough and Ready, is being enlarged almost to the capacity of the channel of the Calaveras River. With that large canal extending east and west along the northern boundary line of the city environs, the means provided to guide water along East street, and the enlargement of Mormon channel, together with the high and solid bulkhead which will be formed by the grade of the Western Pacific Railroad, all who reside on the west side of the railroad may, says the *Independent*, feel certain of exemption from inundation by overflows at any time from the plains.

HELL GATE BLASTING.—The 5-ton drill used for this work is moved by steam from the boiler of the tug anchored in the rapids. This steam is prevented from being condensed in its passage, by being conveyed in a hose placed within a larger one through which the exhaust steam escapes. The inner one is therefore constantly surrounded with a coating or jacket of steam.

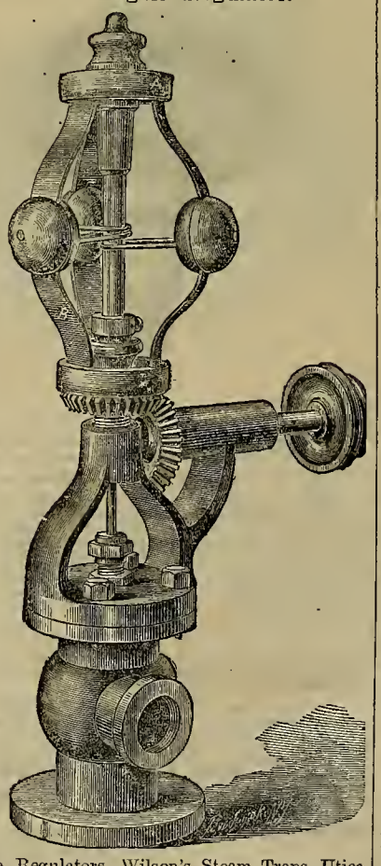
PICKERING'S Engine Regulator.



CAMERON'S **STEAM PUMPS,** all kinds and all sizes, FOR SALE BY DAVID STODDART, Mechanical Engineer, 114 Beale street, San Francisco.

Giffard's Injectors, Pickering's Engine Regulators, Wilson's Steam Traps, Utica Steam Ganges, Steamboat Machinery, Morrison & Seller's Patent Steam Hammers, Seller's Patent Bolt Screwing Machines, Lathes, Planers, Shafting and Hangers, Cooper & Phillips' Turning Tools, Machinists' Tools, Engines and Boilers, Wheeler's Patent Tumbling Beam-Engine for Screw Propellers.

DAVID STODDART, 114 Beale street, San Francisco.

Metallurgy.

MOSHEIMER'S
PIONEER MINING SCHOOL,
—AND—
METALLURGIC WORKS.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of

Chemistry, Assaying and Metallurgy,

That I am prepared to teach all the above branches in less time than in any European School.

I also undertake to assay and work any kind of ore, or mineral substances.

For terms, apply to JOS. MOSHEIMER,
Practical Chemist and Metallurgist.
Office, 328 Montgomery street; Metallurgic Works, 2065 Powell street, San Francisco 6v18-6m

LEOPOLD KUH,
Assayer and Metallurgical Chemist,
(Formerly of the U. S. B. Mint, S. F.)
Office, No. 611 Commercial Street, opposite the Mint, San Francisco.
BULLION MELTED AND ASSAYED,

The correctess of which is guaranteed in every respect. All kinds of Ore and Mineral tested, assayed and analyzed in the most satisfactory manner.

Refers by permission to W. C. Ralston, Cashier Bank of California; Messrs Pioche & Bayerque, Wm. M. Lent, John D. Fry, E Cahill & Co., A. K. Grim, President Pacific Union Express Co.; John M. Eckfeldt, M. and A. U. S. B. Mint; Hale & Norcross S. M. Co., and the principal mining companies on the Comstock Lode. 25v17-tf

PROF. HENRY WURTZ,
Formerly Chemical Examiner in the U. S. Patent Office may be employed professionally as a SCIENTIFIC EXPERT. Geological Examinations and Reports, Analysis and Assays, etc., etc. Practical advice and investigations in the Chemical Arts and Manufactures. Invention and examination of new chemical methods and products. Address, 26 Pine street, Rooms 35 and 36, New York. Always in from 12 to 3.30. ☞ Written communications preferred.

Important to Gold and Silver Miners and Companies.
PROFESSOR WURTZ,
Who is the inventor and Patentee of the new and wonderful uses of SODIUM IN WORKING GOLD AND SILVER ORES AND JEWELERS' SWEEPINGS, will furnish at the above address information in relation thereto, together with experimental packages of
SODIUM AMALGAM.
All instructions and experiments elsewhere obtained are spurious and unreliable. WORKING EXPERIMENTS ON AMALGAMATION OF ORES, Etc. Prof. W. has in operation in New York a large and small Hepburn Pan, for working 1,000 or 20-lb. charges of material for experimental purposes. 3v17

R. TAYLOR. WM. H. TAYLOR.
ROBERT TAYLOR & CO.,
METALLURGISTS.
SMELTING WORKS,
Eleventh street, between Folsom and Howard.
GALVANIZING.
Also, Anti-Friction, Alloys for Journals, Type and Stamping Metals, Tinners and Plumbers' Solder, Etc.
☞ The best price given for the most rebellious or refractory ores. Ores and minerals assayed and analyzed.
ISAAC BLUXOME, Agent,
4v18-3m N. E. cor. Washington and Battery streets.

G. W. STRONG,
ASSAYER AND WORKER OF ORES,
No. 10 Stevenson street, near First, San Francisco.
Highest price paid for choice lots of Ores, Sulphurets, Assay Ashes, Sweepings, etc., etc. Students instructed in all branches of Metallurgy, on liberal terms.
14v15qr.

LEA & PERRINS'
CELEBRATED
WORCESTERSHIRE SAUCE

Declared by connoisseurs to be the only
GOOD SAUCE.

The success of this most delicious and unrivalled condiment having caused certain dealers to apply the name of "Worcestershire Sauce to their own inferior compounds, the public is hereby informed that the only way to secure the genuine, is to ask for

Lea & Perrins' Sauce,

and see that their names are upon the wrapper, labels, stopper, and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against Manufacturers and Venders of such, or any other imitations by which their right may be infringed.

Caution against Fraud.

Ask for LEA & PERRINS' Sauce, and see name on the Wrapper, Label, Bottle, and Stopper.

Wholesale and for Export by the Proprietors, Worcester; Crosse & Blackwell, London, etc., etc.; and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 3v18-6m

SULPHURETS;
What they are;
How Assayed;
How Concentrated;
And How Worked;
With a Chapter on the
BLOW-PIPE ASSAY OF MINERALS.
By WM. BARSTOW, M. D.
Published by A. Roman & Co., San Francisco.
For sale at this Office.--Price, One Dollar.
With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 21v15tf

OBITUARY.—Rivot, the well known metallurgist and professor of mineral analysis at the *Ecole des Mines*, Paris, who was to have come to California in May, died on the 18th of March, in the 48th year of his age. His works on metallurgy and mineral analysis are admired for their clear method, and graphic style in the description of manipulations, and are standards with Percy, Kerl, and Bischoff.

By a British Columbia telegram we learn that the naturalist James Hepburn died at Victoria on the 15th of April.

Sir Edward Cunard, the projector of the Steamship line which bears his name, died in New York on the 7th inst.

A SILVER BRICK, valued at $1,550, from the Autumn mine, one of the claims of the White Pine Mill and Mining Company, has been exposed in the window of Reichling & Co., 334 Montgomery street, for the past few days.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

INDIA FLEA DRUG!

A California Discovery.

This is a simple but very efficient FLEA POWDER.

It is Death to Fleas and Vermin, but not injurious to persons.

TRY IT! TRY IT!! TRY IT!!!

After a thorough test you will use none other.

PUT UP IN BOXES ONLY. FOUR SIZES.

It is the best and cheapest article of the kind ever offered to the public.

Directions for Use.—Sprinkle your bedding and clothes, and add a little in your washing.

For sale, wholesale and retail, by Druggists.

☞ For further information, address

Prof. C. E. JAYCOX,
Care of Langley & Crowell, Druggists,

DROP LETTERS.—It should be distinctly understood that drop letters, when sealed, require but ONE CENT postage in towns or cities where there is no free delivery by carriers.

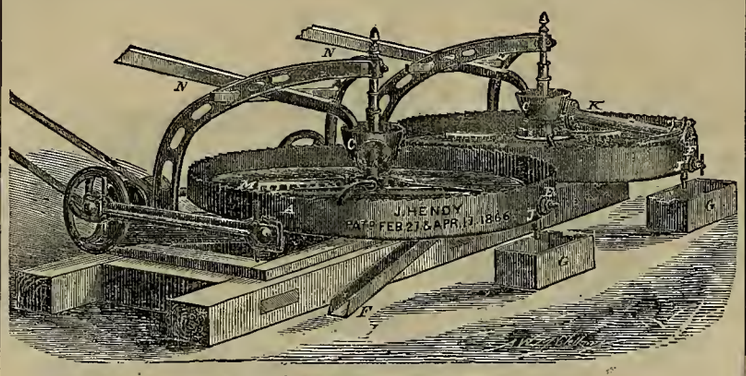
PREMIUM FOR BEST CONCENTRATOR

AWARDED BY THE

MECHANICS' INSTITUTE, 1868,

ALSO AT THE STATE FAIR FOR 1868,

To J. HENDY.



A LARGE NUMBER OF THESE

IMPROVED CONCENTRATORS

ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

OFFICE OF NORTH STAR MINE, GRASS VALLEY, Nov. 12, 1868.

JOSHUA HENDY, ESQ.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.

Respectfully yours, J. H. CROSSMAN, Supt. N. S. Mine.

J. HENDY, Patentee.
Office at Union Iron Works.

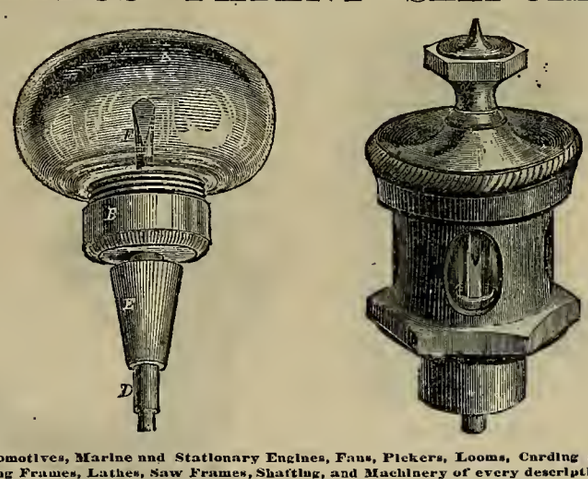
THE STANDARD OF AMERICA.

DREYFUS' PATENT SELF-OILER.



For Locomotives, Marine and Stationary Engines, Fans, Pickers, Looms, Carding and Spinning Frames, Lathes, Saw Frames, Shafting, and Machinery of every description.

A Saving of from 75 to 95 per cent. Guaranteed.

They are composed of a Transparent Glass Cup, mounted in Britannia and Brass, provided with a hollow tube, inside of which is placed a loose-acting solid wire, which acts as a Feeder and Regulator. The wire rests constantly upon the journal, thereby acting with the bearing in its motion. The wire is so regulated inside the tube as to feed according to the demand only. There is no flow of oil whatever while the machinery is not in motion. They are as reliable in winter as in summer, for the reason that the friction produced by the action of the bearing on the wire causes the wire to heat, thereby causing the oil to become limpid. Being perfectly air-tight vessels, the oil will never gum in them, as this has been proven by two years' constant use. They are constructed in a very neat and substantial manner. We spare no pains in making them as perfect as it is possible for them to be made, and GUARANTEE them to give perfect and entire satisfaction.

DIRECTIONS:

Fill the cup full of oil, then screw the cap down air-tight. Place the tube in the oil-hole in an upright position, or upon an angle of 45 degrees. Permit the rod to have a perfectly free action. If you desire to have the oil flow faster, reduce the wire.

REFERENCES:

For the convenience of persons desiring references, we annex the names of a few Manufacturers and Railroad Companies, who are using the Dreyfus Patent Oiler in different parts of the country: San Francisco—Mission Woolen Mills; Pioneer Woolen Mills; Pacific Woolen Mills; Golden State Foundry; Ætna Foundry; Fulton Foundry; Empire Steam Mills; San Francisco Gas Co.; Mechanics' Mills; Bacon & Co, Printers; Bosqui & Co., Printers; B. STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the **10th, 17th** and **30th** of each month that has **30** days.

On the **10th, 18th** and **30th** of each month that has **31** days.

When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding; when the 17th falls on Sunday, they will leave on the Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departure of the 17th or 18th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

The following Steamships will be dispatched on dates as given below:

April 10th—CONSTITUTION.....Capt. Wm. H. Hudson, Connecting with ALASKA, Capt. Gray.
April 17th—GOLDEN CITY.....Capt. Wm. F. Lapidge, Connecting with HENRY CHAUNCEY, Capt. Connor.
April 30th—MONTANA ....Capt E. S. Farnsworth, Connecting with ARIZONA, Capt Maury.

Passengers berthed through. Baggage checked through. One hundred pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets to Liverpool by the "Inman" and "National" Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight to New York and Way Ports, Company's Form of Bill Lading only used.

No Freight will be received on board after 2 P. M. of the day prior to the steamer's departure.

The Steamship GREAT REPUBLIC, Capt. J. M. Cavarly, will be dispatched for HONGKONG on MONDAY, April 5th, 1869, at noon, connecting at YOKOHAMA with the steamer NEW YORK, for SHANGHAI.

For passage, freight and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

The Money Crisis.

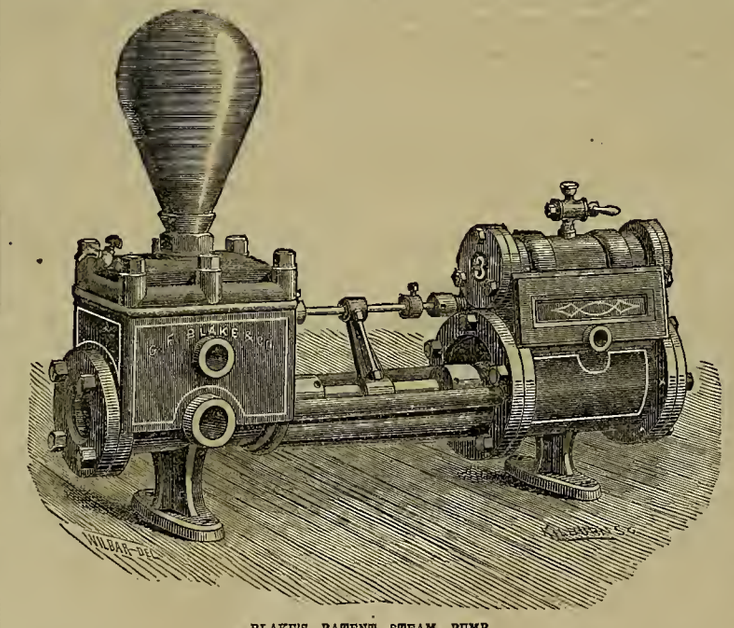
Tho money crisis throngb whicb we are now passing, in this State, is an evidence of our prosperity, rather than otherwise. We are sending away gold and silver by the wholesale, not so mncb to pay debts, as to meet the commercial wants of New York. It is well known that tbe money scarcity here was preceded by a similar lack in that city, brought ahont by gold gamblers in Wall street, or from some otber canse. In tbe emergency then, San Francisco was looked to as one of the principal sources of relief, and the most urgent calls, coupled sometimes with entreaties, wore made npon our merchants and capitalists to forward money to meet the commercial engagements of friends and correspondents at the East. In answer to these calls, remittances were in many cases duplicated, and in some triplicated. These calls came at a time when our people had just entered upon important improvements, such as the extension of Montgomery street, tbe completion of Kearny, the construction of numerons local railroads, the development of a large number of newly-discovered mines in White Pine and the general call for money by the tbousands who are rushing thither, which unusual demands were rapidly absorbing all tbe spare funds tbat our merchants and capitalists held to their credit. As a necessary result, money became scarce, aod tbe gold and silver refinerics and the mint have been taxed to their utmost to supply the deficit. Our resonrces, however, have proven amply sufficient to tide us over the tronble, and are rapidly hearing us once more into smooth water. The depreciation in the value of hreadstuffs, and the mistaken "hold-on" poliey of our grain growers, has also materially aided te bring ahout this condition of things. Had our farmers been wise and continued shipments last summer, steadily, aud realized the better prices then ruling, fully three million dollars additional would have stood to our credit towards meeting this emergency. Instead of that, nearly one million dollars were lost to tho State, by the depreciation, helow the prices of ono year ago, on the sales of wheat and flour for the months of January, February and March. Farmers would do well to bear in mind that San Franeisco is the most expensive city in the world in which to hold their crops—for tbe reason that interest is doubled and storage trebled here.

Blakes's Patent Steam Pump.

The steam pump, which is an independent pump, (or steam engine and pump combined) is comparatively a new invention. It has, however, gained much favor with mechanics, aod now seems to be coming into general use as a "heiler feeder" wherever large engines are empleyed.

The pump, of which the accompanying engraving is a good representation, is the invention of Mr. Georgo F. Blake, of Boston. A poor descriptioo only can he given of it without a diagram of its interior mechanism. The water cylinder is shown in the left hand side of the cut, underneath the air chamher. This cylinder may be made either of brass or cast iron. But



BLAKE'S PATENT STEAM PUMP.

brass valves and seats, or hard rubber valves sbould be used. The water is taken in at the lower aperture, and there are openiugs on hoth sides, for convenience of suction and diseharge pipes. It is a doublo-action pump, having double water valves which are very simple. The water is drawn in and forced out from hoth sidcs of the piston head, which, with the strong and ample copper air-chamber directly over the valves, keeps up a constant and large flow, wben the pump is in operatiou. The steam cylioder in ordinary sizes is about donhle the size of the water cylinder. The small cylioder, directly over the steam cyliuder, contains the steam valve, which is operated entirely by steam, having au auxiliary valve, which is opened by the arm shown on the piston rod, with each stroke, just sufficient to allow the steam to work the main valve quickly. This main valve is cylindrieal, and hy a patent device of Mr. Blake's, is claimed to be perfectly balanced, therehy overcomiog all frictioo or pressure of steam, and allowing it to slide with the greatest facility, as the steam is admitted at either ond of the valve cylinder. The construction of the valve and auxiliary valve is such that it is impossible for the piston to stop "on the ceoter," which was a geueral fanlt with steam pumps prior to adopting the plan of driving the valve itself by steam.

This pump took the first prize at tbe Maryland Institute, io 1868; the geld medal of the Middlesex Mechanic Association, of Massachusetts, the same year, and the gold medal of tho Massachusetts Charitable Mechanics' Association; the New Hampshire Mechanics' Association, and the Iowa State Fair, in 1867.

The inventor claims for it "that it is positive under any pressure; may be run as slow or fast as may ho desired; will discharge more water than others of same dimensions; that the steam part beiog cast in one entire piece, ohviates tho trouble of leaky joints; that the steam valve is as perfectly balanced as the nature of such a device will admit of; that it will start at any point of the stroke and discharge all the water of condensation.

These pumps are now very generally employed at the East, as boiler feeders, and in sugar honses, breweries, taoneries, steamboats, etc., and for mining and fire purposes. They are made by George F. Blake & Co., of Boston; twelve different sizes being now in the market, adapted to classes of work varying from a diseharge of 20 to 3,000 gallons per minute. They may he seen at W. O. M. Berry & Co's, 114 Californiа street, San Fraociseo, the manufacturer's agents, and who will doubtless be pleased to give any further iuformation in regard to them.

STATE TEACHERS' INSTITUTE.—Tho State Teachers' Iostitute will convene in San Francisco, on Tuesday, May 4th, at Lincoln Hall. It is expected that there will be a general attendance of Teachers from all parts of tl e State.

The Stone Age in California.

Mr. C. D. Voy's notes of the localities in this State where human relics of the "Stone Age" have heen found, are all on the authority of personal visits to the places named; that gentleman being a mest indefatigable collector, and in possession of many fossils that the State Geelogical Survey has not had the opportunity to describe. The fossils fouod in the auriferous gravel channels under lava flows and volcanic cement ridges, have been, so far as discovered, all of extinct species, except tho stone relics and bones of the human raco. Prof. Whitoey accordiogly draws a distinct lioe, placing all formations containing these animals that lived prior to tho opoch of volcanic activity into tho pliocene tertiary age, and all those containing some of the species that still exist, into the post-tertiary.

The aocient gravel rivers, however, contioued forming after the volcanic epoch; so that the fossils contained io the preceding schednle are evidently not all of the same age. These of the older formation are a rhinoceros, a kind of hippopotamus, an extinct horse, and a camel; while the mastodon aud elephant, tapir, buffalo and horse are certainly younger, marking what is called the post-tertiary, or post-plioceoo, tho latter term beiug used by Lyell to designate the time interveniog between the calaclysms that terminated the pliocene, and the appearaoce of man, or the receot age.

It will he seen that California lays claim—provided that Whitney's parallelisms are correct—to a much more ancient existence of the human race than even the geologists previously dreamed of. The older pliocene fossils mentioned are referred to the same age as the White and Niobrara river tertiary, heyond tho Rocky Mountains; high up on their eastern slopes, whose rocks are witnesses to our eyes to-day of an elevating force in that region of over 1,000 feet.

THE OVERLAND MONTHLY is becoming a fixture, anda necessity to all who read, and whose mental vision embraces the Pacific borizon. Tbe May number embraces many readahle, and a few valuahlo articles. "Mining Excitements in California," "How We Live in Nevada," and "Tho Building of the Iron Road," constitute excellent matter, though of the lighter sort. "The Last of tbe Leather Stockings," and "Siletz, or, Lo Reconstructed," present good oecidental Indian pictures that will recall pleasant recollections with many. "A Hawaiian Feast," and "A Pony Ride in Kamschatka," with a few poems, stories, etc., make up tho remainder of the table of contents.

THE "OLD OAKEN BUCKET" literary, published by Cowan & Protzman, Indianapolis, Indiana, at $2 a year, is a well-gotteo-up magazine of fifty-four pages, in wbich tho temperance cause is popularized, by making the dissemination of its priociples secondary to good home entertainment and instruction.

Communications.

[Written for the Mining and Scientific Press.]

Relics of the Stone Age, found in California.

BY C. D. VOY.

Few countries equal California in the number of fossil remains disclosed of the elephant, the rhinoceros, the mammoth, and the mastodon, besides numerous other animals of the Pliocene age, accompanied with the bones and skulls of the ancient human inhabitants who peopled this country thousands of years ago. These remains embracing a variety of stone relics, have been, within the past few years, and are now being exhumed in the mining districts, with their cotemporaries of the animal creation, by the miner in his search for golden treasure; so that science is being greatly enriched by the development of a geological history of the human race, at the same time that the miner is being rewarded by the harvest of his labors. I present you with the following list of localities in which, to my knowledge, these fosils have been found:

HUMBOLDT COUNTY.

In the vicinity of Humboldt Point, there have been found numerous bones and teeth of the mastodon and elephant, in a sedimentary deposit, consisting of sand and gravel, from 20 to 30 feet deep.

About southeast of this, at a locality known as Ferndale, there have been found some mastodon teeth, imbedded in bluish clay, from 10 to 12 feet deep. Not far from here there have been found numerous stone mortars and pestles, made of porphyritic granite, and numerous singular relics of unknown use, but unmistakably the work of human hands, proving that a race of human beings inhabited the country coëxistent with the huge monsters named.

Crossing over quite a range of mountains about in a northeasterly direction, we enter

TRINITY COUNTY.

Following up the Trinity River, for a considerable distance, we come to some mining claims about two miles below Douglass City—a small mining camp—in which, on the banks of the river, there have been found numerous fossil teeth, bones, and what was supposed to be part of a skull of the mastodon, imbedded in hard auriferous cement gravel, about eight feet deep; but most of the bones crumbled to dust after a short exposure to the atmosphere.

About eight miles above this on the river, there have been found numerous large fossil horse teeth, some of which were four inches long and about one and a half inches square, showing that they belonged to a very large species. These were found in auriferous gravel, from eight to ten feet deep.

In the various gravel deposits, of this county, there have also been found quite a number of stone relics, such as mortars and pestles, besides other interesting articles of uses unknown to us at the present time, but evidently made by human hands.

SISKIYOU COUNTY.

On Scott River, at a locality known as French Bar, in some mining claims, fossil teeth, and part of a tusk and some bones of the mastodon were found 20 feet deep, imbedded in auriferous cement gravel, with fossil flesh water mussels, making a somewhat singular conglomerate. On this river there have been found also stone mortars, pestles, and other stone relics, in gravel deposits at various depths.

Crossing over the mountains about in a northeasterly direction, we come to

YREKA COUNTY.

In this vicinity there have been found quite a number of stone mortars and pestles in gravel. North of here at Cottonwood, near the Klamath River, stone relics, such as mortars, pestles, arrowheads, etc., made of obsidian, have been dug up by the miners. Going southerly we cross over Scott mountain and reach

SHASTA COUNTY.

In this county, likewise, in the various gravel deposits, there have been found stone mortars, pestles, and other interesting relics, at various depths.

PLACER COUNTY.

About five miles northeast of Lincoln, stone relics, at various depths in the gravel deposits.

At Butcher's Ranch, below Todd's Valley, very large elephants' teeth and bones, besides smaller animals, in auriferous clay gravel, from 10 to 40 feet deep.

At Forest Hill, a short distance below the town, in a southerly direction.

At Byrd's Valley, in the auriferous gravel deposits, from 10 to 20 feet deep. We now cross the American River, into

EL DORADO COUNTY.

Stone relics near Georgetown, and at Spanish Flat, and vicinity; in the latter locality there have been found, besides stone mortars and pestles, large stone platters and oval stones, with grooves around them, having the appearance of being used as war clubs. Some other implements, probably used as handles for a bow, hollow on one side to fit the weapon, and convex on the other, to give the hand a better grasp, large spear-heads, made of obsidian, etc., are also found.

At a mining camp, known as Soapweed, similar stone relics are found in the auriferous gravel, from 10 to 20 feet deep. All the stone mortars are made of the very hard granite which is found in this State.

At Placerville, in auriferous gravel from 10 to 30 feet deep; at Shingle Springs, and three miles northeast.

AMADOR COUNTY.

At Fiddletown stone mortars have been found in the different gravel deposits from 10 to 14 feet deep.

Westerly from this at Forest Home, stone relics have been found from 20 to 30 feet deep. Traveling southerly from here we come to Jackson, and two miles south of this, in some mining claims, stone relics exist in gravel from 10 to 14 feet deep.

At Little Grass Valley, near Pine Grove, mastodon teeth and bones, besides numerous bones of smaller animals, have been found in auriferous clay gravel, from 10 to 16 feet deep, but most of the bones at once crumbled to dust on exposure to the atmosphere. In close proximity to these there were found stone relics.

CALAVERAS COUNTY.

At Railroad Flat, stone mortars were found, in the auriferous gravel deposits, from 10 to 16 feet deep.

At Murphy's Camp;—this locality has been quite prolific in fossil remains, such as the mastodon, elephant, and numerous smaller animals. Some of the elephants' teeth were over eight inches long and four and a half inches wide; some of the mastodon teeth, over six inches long and three inches wide, being found in auriferous clay gravel from 14 to 20 feet deep, in close proximity to stone mortars, pestles, arrowheads, etc.

The method of working the mines is such as frequently to destroy all delicate matter, and often if the bones escape the pick, they are destroyed to amuse the finder.

Southwest from this at Altaville, is the locality where the Pliocene skull was found, of which Professor J. D. Whitney, of the State Geological Survey, gave a full description. Only a portion of it is preserved. The frontal bones are entire. The bones of the face are in most respects complete. Almost all traces of teeth are gone; the skull must therefore have belonged to a very old person. A few human bones were found with it. The skull presents no sign of belonging to a race inferior to the present race of Indians. In so far as it differs it approaches the Esquimaux type. I give below the deposits passed through in sinking the shaft to the bed-rock.

No. 1.	Black lava (volcanic ashes)	40 feet.
2.	Gravel	3 "
3.	Light lava	30 "
4.	Gravel	5 "
5.	Light lava	15 "
6.	Gravel	25 "
7.	Dark brown lava	9 "
8.	Gravel, containing the skull	5 "
9.	Red lava	4 "
10.	Red gravel	17 "
		153 feet.

The skull was found in bed number 8, just above the lowest stratum of lava. With the skull were found fragments of silicified wood. The above are supposed to be the oldest remains of fossil man yet found.

A short distance from this there were some stone mortars, and other interesting stone relics, found in mining claims about 10 feet deep.

STANISLAUS COUNTY.

On the Stanislaus river, opposite Knights' Ferry, mastodon teeth and bones, besides what were supposed to be human bones of gigantic size, were found by some miners about 20 feet deep, some years ago, in a variety of conglomerate gravel. In various gravel deposits on this river, numerous stone relics have been found.

TUOLUMNE COUNTY.

In some mining claims on Gold Spring Creek, below Columbia, there have been found fossil bones and teeth of the mastodon, besides numerous bones of other animals, in calcareous tufa from 16 to 20 feet deep. This is one of the most prolific localities in the country; yet very few specimens have been preserved. There are a large number of fossil Helices, commonly called snail shell, and of small fossil fresh water shells. Beneath all there is auriferous gravel.

At Columbia, a short distance above this, there have been found stone relics in the gravel deposits.

Southerly from here, at Springfield, a small mining camp, stone relics in different mining claims.

At Shaw's Flat large fossil teeth and bones of the mastodon, and other large animals, at various depths, in the auriferous clayey gravel deposits. In the vicinity of these have been found numerous stone mortars, pestles, large stone platters and arrow-heads, made of obsidian.

Under Table Mountain. This consists of a plateau of basalt, which flows as lava from a volcano, covering in the bed of an ancient stream, and this basalt has resisted the wear of the elements, and now stands as a monument for miles in length. At the bottom of this is a rocky valley, showing "rim-rock," as the miners call it; it is shaped somewhat like a cup, and its rim rises on each side into visible mountains of older structure. This trough, so to speak, is filled with sedimentary gravel, and numerous fossils of huge animals, such as the mastodon, elephant, and other large animals, with numerous fossil trees and leaves are found, at various depths from 50 to 300 feet. Besides these there have been found stone relics, such as mortars and pestles, large stone platters, some very singular ornaments in the shape of large stone beads. There were also found some human remains in 1855, consisting of an immense jaw bone and some teeth; likewise what was supposed to be the two thigh bones of a man, well preserved. The under jaw of this skeleton is five and a half inches at the widest place, and is immensely strong. That of a common sized man now is about three and a half inches, at the same place of measurement. Here we have silent testimony that this country was once inhabited by a race of huge people, or at least by a race some of whom were gigantic. Since beasts of such wonderous size had their existence in that remote age, it seems human beings had to be constructed on a like scale of grandeur, the proportions of nature being then observed as now. Below all this is a vast sedimentary deposit of fossil leaves, from four to six feet thick. Some of the leaves are very large and of different varieties, having the appearance of belonging to a tropical climate. At the very bottom of this cup, so to speak, the gravel is rich in nuggets of gold, and the miner taps through the "rim-rock" to get at it, or descends to it by vertical shafts.

In the different mines on Wood's Creek, near Sonora, there have been found numerous fossil teeth of the mastodon, and tapir, in auriferous gravel deposits, besides stone relics.

At Soulsbyville;—this has been quite an interesting locality for fossils. Here also is the bed of an ancient stream, covered over by volcanic ash, locally known as "lava;" beneath this there is gravel, in which numerous fossils of the elephant, mastodon, and smaller animals, have been found at a depth of between 200 to 300 feet, safely covered with volcanic rock, as if God meant that man should some day read the record of his works, and so shut them in safely to preserve them from decay.

We now retrace our way to Sonora. Going southerly from here, we come to some mining claims known as Kincaid Flat, another interesting locality for fossils, such as mastodon teeth, bones and tusks, besides bones of other animals. These remains are found in a stratum of blue clay, about 16 feet deep, underneath which there is auriferous gravel. In close proximity there are stone relics.

A short distance from here, at Forktown Gulch, mastodon teeth and bones are found in the auriferous gravel about 30 feet deep.

MERCED COUNTY.

At Snellings, and vicinity, stone mortars and other stone relics are found in gravel deposits.

About six miles northwest from Snellings, on Dry Creek, fossil teeth and bones of the mastodon, besides other smaller animals, are found in a deposit of clay about 10 feet deep.

MARIPOSA COUNTY.

In the vicinity of Hornitos stone mortars, etc., are found in the gravel deposits at various depths.

About four miles northeast of Hornitos, in some mining claims on what is known as No. 1 Gulch, fossil bones and teeth of the elephant, horse, and other animals, are found in auriferous clay gravel about 16 feet deep. Some of the elephant teeth measured over eight inches in length and four and a half inches in width. Some of the horses teeth were over four inches long and one and a half inches wide.

At Princeton, in some mining claims, there are stone mortars, pestles, large spear-heads and arrow-heads made of obsidian, etc.

Three miles South of the town of Mariposa, in some mining claims, stone mortars, arrow-heads, etc.

At Indian Gulch, in gravel, stone relics.

Going from here in a southerly direction about ten miles we come to a dry creek, which empties into Bear Creek; at this locality there are found fossil bones and teeth of the horse, tapir, and mastodon, imbedded in a variety of volcanic ash, from 10 to 14 feet deep. That these animals perished by the overflow of volcanic ash the locality gives plain evidence.

FRESNO COUNTY.

On the Fresno river, about six miles above the Buchanan Hollow. Crossing at this locality there are to be found quite a number of fossil bones and teeth of the elephant and horse, imbedded in auriferous gravel 10 feet deep, on the bank of the river; also in the bed of the river from 8 to 12 feet deep.

About ten miles southeast of Millerton, on Dry Creek, was found a large fossil tusk, perhaps of the elephant, over eight feet long imbedded in alluvial soil three feet deep, which evidently had been buried much deeper at some time.

TULARE COUNTY.

At Gordon Gulch, about seven miles southeast of White River, in some mining claims, fossil bones and teeth of the elephant, mastodon and horse have been found.

MONO COUNTY.

At Independence, mastodon teeth and bones, in gravel.

SONOMA COUNTY.

Lately the skeleton of a mastodon was discovered on Petaluma creek. The tusks measured 22 inches in circumference, and the width of the skull is nearly four feet. In the vicinity of and on Mare Island fossil bones and teeth on the mastodon and horse have been found in close connection with fossil oysters.

CONTRA COSTA COUNTY.

About three miles from Antioch, towards Mount Diablo, there are found some teeth and bones of the mastodon in a species of clay, eight feet deep.

ALAMEDA COUNTY.

Near the Vallejo mills, mastodon bones are found in alluvial soil.

WONDERS WE READ OF.—Speaking of the meat from the sky, the water spirits, the ornithology, and meteorology of San José, the *Herald* seeks to make that rural retreat famous amongst remarkable places: It says:

Her astonishing, sensational, sea-serpent-like stories are a continual source of discussion in our Academy of Science; and much do the latter cogitate, and investigate her inexhaustible succession of marvels. Lately she had a shower of meat, illustrating the old proverb, that "he that hath, unto him shall be given." The next sensation of that community was a water-spot, which was found upon a bed quite early in the morning, for several days in succession, and which was supposed to have been produced by feline spirits of the incorporeal air. Then followed a story of a remarkable canary bird, as large as a turkey-cock, which sunned its plumage near the pleiades at midnight, and sang with that constellation, the music of the spheres. This bird fed on flesh, and it is likely that a wise dispensation of Providence sent it to devour the fields of meat and *beds* of water previously sent. The last wonder is a celestial phenomenon, consisting of two water dogs, which arose one morning with the sun to take a look at San José. They had horns, and two tails each, also wore spectacles, and were probably looking for more meat.

Mechanical.

Silver Plating in 1808 and 1840.—We condense and contrast the two methods here given, from the Birmingham correspondence of *The Engineer:*

An ingot of copper was planed by a machine, and a rolled plate of silver laid upon it,—the two touching surfaces being first scraped quite clean and bright. It was then "bedded,"—by placing upon it a heavy piece of iron, which was struck with a sledge hammer until every part of the two surfaces touched. It was then bound together with wires, a solution of borax was placed around the edges of the silver as a flux, and the whole was heated in a small furnace until union was effected. The ingot was then cooled gradually, the wires cut off, and the edges filed; it was then rolled to the required thickness, and was ready for the manufacturer.

In 1840 this clumsy process was completely superseded by the electro-plating. The manufactured article being first cleansed, is plunged into a solution of cyanide of mercury, and transferred at once to the plating vat, where it is suspended in the silver solution. The deposit goes on so regularly that its progress is accurately known. At the proper time the plated article is taken out, rinsed in cold water, dried, and the work is done. Its previous weight being known, its present weight gives the exact value of the silver upon it.

Solar Heat as a Motor.—M. Mouchot, in a communication to *Comptes Rendus* says that he proved, in 1861, the possibility of maintaining a hot-air engine in motion by means of the sun's rays alone; and that more recently he had boiled considerable amounts of water by the same means. With a silver reflector, having a surface of one square metre, he vaporized one litre of water (⅞ of one quart) in one hundred minutes. In June, 1866, he succeeded in operating a small steam engine with solar heat.

Pressure Not Power.—In the course of a recent discussion at the rooms of the Polytechnic Association in New York, Dr. Van der Weyde remarked that the difficulty with those who think they have discovered perpetual motion is, generally, that they confound *pressure* with *power*. The Dr. said: "We have been personally consulted, during the last ten years by eleven different persons, who supposed they had discovered perpetual motion; and, of the eleven, no less than nine had based their inventions on this fundamental error, imagining that simple pressure or attraction would produce perpetual force. In one of our scientific papers, it was stated that a cubic inch of water, if converted into steam, would exert power sufficient to raise a ton. This is no statement at all. If they had said—"raise a ton a foot high," we would know what was meant. When the element of time is introduced, we have power. Thus, 33,000 pounds raised one foot high in one minute is a horse-power. If eight minutes be occupied in the work we have a man-power."

Expansion of Iron during Cooling.—*Scientific Review* says that Mr. Gore, of Birmingham, whilst making some experiments on heating a strained iron wire to redness by means of a current of voltaic electricity, has observed that on disconnecting the battery, and allowing the wire to cool, during the process of cooling the wire suddenly elongated, and then gradually shortened until it became quite cold. No explanation of the action has been advanced.

The Largest Rope ever Made.—A round wire rope, 5 1-4 inches in circumference, 11,000 yards long, and weighing upwards of sixty tons, is now making in Birmingham. The rope consists of six strands, ten wires in each strand, and each wire measuring 12,160 yards. The whole length of wire is 726,000 yards, or 412 1-2 miles; the six strands surrounding a hemp center of 27 threads of rope yarn, each thread measuring 15,000 yards, or a little over 230 miles.

Galvanizing Iron.—The following is from the *Colliery Guardian*: To galvanize iron it is immersed for a certain period in an acid, to cleanse the surface, after which it is dipped into a bath containing melted zinc and tin. In this salts of ammonia are thrown, which operate on the metal as a solvent, and secure its more even distribution over the surface. From this bath is given off a dense, pungent, white-colored vapor, which is heavy, and, especially in damp weather, spreads and becomes offensive. Complaints have been made of this vapor, and various attempts have been made, without success, to prevent its passing into the atmosphere. The Wolverhampton Corrugated Iron Company have adopted a plan which is found effectual. The top of the bath is surrounded by an open flue which forms a projecting lip, and from this run pipes which communicate with a powerful fan. From the fan a large flue extends to a furnace, which is used for annealing the article galvanized. The fan, by exhausting the air from the pipes, causes a strong downward current of air to sweep over the surface of the metal, which drives the vapor into the flue, down the pipes, and from the fan to the furnace, where it is entirely consumed.

A Novelty in Turret Clocks.—Ritchie and Sons, Edinburgh, have just completed a large turret clock for the Bombay Harbor Board, which indicates the hours, minutes, and center-seconds upon a dial 8¼ ft. in diameter. It is said that this is the largest clock in the world having a center-second hand. The mechanical difficulties which beset such a construction of clock have hitherto been regarded as too serious to be faced. One is regulating the motion of the long center-hand, measuring 6½ ft. The momentum which it would have acquired at the point in passing through a space of 5 in.—the distance between one second mark and another—would have caused the hand to sway backwards and forwards during the whole second. Besides, the strain upon the machinery from such a motion would have been great. This difficulty has been overcome by a series of sixty levers, so arranged that the second hand rests in one of them at each beat; the point of the hand being so contrived that when it rests upon a lever it is detained there, and can get neither backwards or forwards until the clockwork removes the lever out of the way.—*Engineering.*

Horse Power.—The worst method of applying the power of a horse to the propulsion of machinery, is the endless chain horse-power in common use, even when properly made and set with reference to the machinery to be driven. In this contrivance the loss by friction is enormous, rotating wheels having to bear continually the whole weight of the horse and the shock of his steps. The only reason that it is commonly used is that it takes up little more room than the horse himself, and is easily transportable. This is not the case with the whim, which undoubtedly, when of larger diameter, is the most advantageous disposition of the tractive power of the animal.—*Am. Jour. Mining.*

Artificial Ebony.—This is made by taking sixty parts of powdered seaweed,—obtained by treating the seaweed for two hours in dilute sulphuric acid,—drying and grinding it, and adding to it ten parts of liquid glue, five parts gutta percha, and two and a half parts india rubber,—the last two dissolved in naphtha, then adding ten parts of coal tar, five parts pulverized sulphur, two parts pulverized alum, and five parts of powdered rosin, and heating the mixture to about 300° Fah.

Spun Glass.—M. Jules Brunfaut is exhibiting in Vienna, ribbons, head dresses, cuffs, collars, wristlets, watch-chains, fancy feathers—woven from finely-spun glass. The delicate threads are more tenacious, flexible and durable than any heretofore produced. They are as fine as the threads of a spider's web, and can be used for knitting or sewing, working equally well by hand or machine.

Hot Air Engines.—There are now in operation in the United States about 400 Roper hot air engines. These engines are specially adapted for use in shoe factories, small machine shops, printing offices, and other establishments where light power is needed. Several important improvements have been made in this engine, and it is rapidly gaining in popularity.

Omnimeter.—This is a new instrument invented by M. Eckold, for measuring distances, altitudes and angles. It embraces all the advantages of the theodolite and level, and does away with tedious chain measurements.

Scientific Miscellany.

What takes place in Luminous Flames?

E. W. Hilgard, in *Silliman's Journal* for March, has an article on "luminous Flames," a portion of which, in reference to certain exploded errors still taught in the books, we condense: Sir Humphrey Davy established the necessity of the presence of a solid incandescent body to produce useful luminosity; and in reference to the flames of hydrocarbons in particular, he suggested that the liberation of carbon in them was owing to the combustion of the hydrogen of the compound in advance of its carbon, the latter being heated to incandescence by an oxhydrogen flame, as it were, and failing to be consumed until all the hydrogen was first oxidized. It is remarkable that an explanation so directly at variance with the daily experience of blacksmiths, and with a lecture experiment performed even in the most elementary course of chemistry, could so long have passed current; for the decomposition of steam by ignited charcoal into hydrogen and carbonic oxide gases is an old observation. In 1852, at Heidelberg, Bunsen suggested to me as an interesting subject of investigation, the composition of the gases in the various portions of the flame. I constructed a lamp adapted to the introduction of a suction tube into the flame from below, and made a series of fifteen analyses of the gases so collected at various points of the interior cone of the flames of beef tallow, and of wax. My analysis showed the existence even in the highest portion of the cone, of free hydrogen with a large excess of carbonic oxide and carbonic acid; the amount of hydrogen varying but little from base to point, while the carbonic acid increased in about the same ratio as nitrogen, i. e., in proportion to the oxygen entering the flame. Bunsen as well as myself failed, however, to draw the legitimate conclusion from these facts, at the time. Landolt, two years later, took up the subject. He used illuminating gas of known composition, and was therefore enabled to determine the deficient factor in my analysis, viz., water; but he also failed to draw the inevitable conclusion as to what *must* happen in the luminous cone. Later, Lunge likewise failed.

In June, 1860, Erdmann first distinctly enunciates that the carbon in a flame is oxidized *before* the hydrogen, and that the separation of carbon upon which luminosity depends, is due to heat alone, as would be the case were the gas passed through a red hot tube.

Finally, eighteen months later, Kersten proves by eudiometric experiments that whenever a hydrocarbon is exploded with oxygen, insufficient to burn more than the carbon to carbonic oxide, no hydrogen at all is oxidized; but that as between carbonic oxide and hydrogen, the formation of carbonic acid on one hand and of water on the other depend upon "chemical mass," as Bunsen had already shown.

This question has therefore been settled by experiments, as much as eight years. Yet the latest editions of text-books published in this country still retain the old error regarding the successive oxidation."

Magnetism and High Temperature.—M. Treve read a communication at a recent meeting of the French Academy, relative to the "action of electro-magnetic currents on liquid iron. He caused some molten iron to pass into a cylindrical mold in the axis of a magneto-electric bobbin, and at the same time, and for the purpose of comparison, he allowed some of the iron to pass into a mold of the same form and size as the first, but unconnected with the magneto-electric apparatus. After cooling, it was found that there was no difference in crystallization between the two casts; but it was found that the iron passed through the bobbin had acquired and maintained even in cooling, a certain considerable amount of magnetic action; "thus,"—said the author,—"proving that there is no incompatibility between magnetism and high temperature."

Pure Water in Lead Pipes.—Dr. Schwartz, of Breslau, suggests the protecting of water from the poisonous action of lead pipes, by forming on the inner surface of the pipes an insoluble coating of sulphuret of lead. This is done by filling them with a warm and concentrated solution of sulphuret of potassium or sodium, and allowing it to remain about fifteen minutes.

Spontaneous Generation.—Dr. J. H. Bennett, of Edinburgh, contributes a paper to *Popular Science Review* for January upon "The Molecular origin of Infusoria." He says that all who have carefully watched, with the microscope, the molecular pellicle which floats on the surface of putrefying or fermenting liquids, have admitted that the infusoria originate and are developed therein. He holds that the germs of these organisms do not exist in the air, nor multiply by self division, nor are they capable of elongating or aggregating, thus forming filaments or larger masses, unless by the union of other molecules like themselves. He holds, also, that they cannot preëxist in the water, as the numerous experiments by Pouchet, Meunier, etc., have shown that all animal and vegetable germs are killed by boiling them; yet nothing is more certain than that long ebullition of various infusions has wholly failed to prevent the formation in them of animal and vegetable growths," the molecules appearing in them after the water cools. He ascribes their origin to phenomena of a chemical nature; the results of the discussions in the French Academy of Sciences for the last eight years, showing "that not the slightest proof is given by the chemists, with M. Pasteur at their head, that fermentation and putrefaction are necessarily dependent on living germs existing in the atmosphere." In conclusion, the author holds that the infusoria, animal and vegetable, "originate in oleo-albuminous molecules, which are formed in organic fluids, and which, floating to the surface, form the pellicle or proligerous matter. There, under the influence of varied conditions, such as temperature, light, chemical exchanges, density, pressure, and composition of atmospheric air, and of the fluid, etc., the molecules by their coalescence, produce the lower forms of vegetable and animal life."

The Microscope in Blow-pipe Chemistry.—At a recent *soiree* given by the President of the Royal Society, Mr. H. C. Sorby, F. R. S., showed some new applications of the spectrum-microscope. The following is one of these as described in *The Engineer*: A borax bead saturated with the substance to be examined, is kept hot over a lamp, so that crystals may be deposited in it. By using the microscope many elements may then be easily distinguished in the form of crystals, which are often of extreme beauty. When much mixed, however, or combined with silica or other acids, as in natural minerals, it is often requisite to add various reagents, such as phosphate of soda, microcosmic salt, boracic, molybdic, and tungstic acids. These give rise to characteristic crystalline deposits; and we may thus distinguish lime, magnesia, baryta, and strontia, even when combined with silica, and can even detect magnesia when mixed with several times its weight of lime in impure limestone."

Jargonia.—This is a newly-discovered earth, closely allied to zirconia, and found in small quantities with zircons from different localities. The following are its properties as described by Mr. Sorby: "The natural silicate is almost, if not quite colorless, and yet gives a spectrum which shows above a dozen black lines much more distinct than even those characteristic of salts of didymium. When melted with borax it gives a glassy bead, clear and colorless, both hot and cold, and no trace of absorption bands can be seen in the spectrum; but if the borax bead be saturated at a high temperature, and fused so that it be filled with crystals of borate of jargonia, the spectrum shows four distinct absorption bands unlike those of any other known substance."

Value of Dry Bones.—Prof. Johnston says that one hundred pounds of dry bone-dust add to the soil as much organic animal matter as three hundred or four hundred pounds of blood or flesh, and also, at the same time, two-thirds of their weight of inorganic matter—lime, magnesia, common salt, soda, phosphoric acid—all of which should be present in a fertile soil.

Eclipse in 1869.—There will be two eclipses of the sun and two of the moon, during the present year. A total eclipse of the sun will occur on the 7th of August, and will be visible to North America and Eastern Asia. It will begin at Boston at 5:24 P. M.

Company Transactions.

New Incorporations.

New articles of incorporation have been filed, as reported in our exchanges during the past week, in the County Clerk's office in this city, and the Secretary of State's office at Sacramento, etc., as follows:

MINING COMPANIES.

The number of these is less this week than last, their place being represented by land purchasing incorporations, as seen below under Homesteads.

The George Washington S. M. Co., White Pine. April 23d. Capital stock, $100,000. Trustees—E. Hilton, M. J. Wright, E. J. Wilson, A. Powell and W. C. Greaves.

The Armadilla M. M. Co., White Pine. April 23d. Capital $2,400,000. Trustees—William Hollis, J. W. Jordan, H. N. Tilden, Cyrus Bradley, J. H. Seymour, J. Stratton J. Seymour and C. B. Tilley.

The Victoria M. and M. Co. Object, to work mines of gold, silver and lead in White Pine. April 26th. Capital stock, $1,200,000; 1,200 shares of $100 each. Trustees—D. L. Emerson, R. P. Thomas, I. S. Waing, C. Walker, G. W. Durgan, H. A. Palmer and T. C. Coxhead.

The Chloride Flat S. M. Co.; location of claim, White Pine. April 26th. Capital stock, $2,500,000; 25,000 shares of $100 each. Trustees—J. F. Miller, T. B. Shannon, S. Clark, Nathaniel Page and C. A. Parsons.

The Thomas Tobin. White Pine. April 29th. Capital stock, $1,000,000.

The Chester Co. White Pine. April 29th. Capital etock, $1,800,000.

The Pomeroy & Dixon Co. White Pine. April 29th. Capital stock $500,000.

At White Pine, says the *News*, but one certificate of incorporation has been filed with the County Clerk,—the Industry—one of the promising claims of the Pogonip.

HOMESTEAD ASSOCIATIONS.

Increased interest is taken, especially by those who command small, but regular incomes in real estate, not only in San Francisco and the larger cities of California, but large tracts of land, which are actively canvassed all over the State, with a view to their subdivision into farms. Thus our new community is dividing itself—as observable under this department—into two or more classes, which may be recognized by their fundamental differences in character: the regular, plodding and less ambitious sort, who in many instances have experienced their mining campaigns as well—who are content, at all events, with moderate things; and the ambitious, the energetic and hopeful, who are taking possession of the wealth and resources of the great interior, who aim and are destined to obtain the many splendid prizes that are scattered to reward their greater risk and enterprise. The *Occident*, representing the spirit of the former, says:

The Homestead Association is a wonderful invention. It furnishes an unsurpassed savings bank. It diffuses wealth. It provides a home with all its delightful charms and attractions. It encourages marriage and the blessed family relationships—the unequaled safegnard of man and woman. It tends to drive poverty into banishment, by preventing vicious habits. When the world is a Universal Homestead Association, the millenium will have come, and everybody may eat their own grapes and figs without fear of molestation.

The following are the additional incorporations recorded or spoken of during the week:

Mission and Thirtieth St. Homestead Union.—Object, to purchase certain lands in the Fairmonnt Tract, San Francisco County; to improve and divide the same into lots suitable for homesteads amongst the shareholders. April 29th. Capital stock, $103,125, divided into 275 shares of $375 each. Trustees: Wm. J. Gunn, Wallace Everson, John W. Shaeffer. B. H. Ramsdell, Gottleih Beer, Charles F. Brown and Joho Kurtz.

Park Hill Homestead Association.—Object, to purchase certain lands on Fourteenth street, and adjoining Park Hill; the improvement thereof, and its subdivision into lots and parcels suitable for homesteads, and their distribution amongst the shareholders. April 29th. Capital stock, $900,000, divided into 100 shares of $900 each. Trustees: Alfred Rix, Egbert Judson, Claus Spreckels, Thomas Varney, C. T. Forrest, Ludwig Altschul and R. K. Rogers.

Oakland Homestead Association.—April 29th. Certificate of the increase of the capital stock from $62,500, divided into 125 shares of $500 each, to $69,500, divided into 139 shares of $500 each.

Concordia Homestead Association.—Object, the purchase of certain lands forming a portion of Bernal Rancho, the improvement thereof, and its subdivision into lots and parcels for distribution amongst the shareholders. April 29th. Capital stock, $111,650, divided into 319 shares of $350 each. Trustees and officers: Jacob Greenhaum, President; L. B. Watson, Treasurer; Louis Kaplan, Secretary; L. B. Collins and J. D. P. Teller, Trustees.

The Union Pacific Railroad Homestead Association.—The tract of land selected by this association is east and southerly of the present passenger depot, at Vallejo, and along the stage road leading from that city to Benicia, about fifteen minutes' walk from the depot, and a like distance from the passenger wharf at South Vallejo. The price of shares is fixed at $225, payable in installments of $10 per month.

In regard to the White Tract Homestead Association, mentioned in our last issue, the Vallejo *Recorder* of April 23d says: The price of lots (a fifth of an acre) has been fixed at $150 each, payable in installments of $10 per month. It is known that this tract of land lies between the California Pacific Railroad and the waters of our bay, accessible to either, at all times. The land is gently undulating and highly productive, and what lends additional value to it is that the Vallejo and Humboldt Railroad passes through the whole length of the tract.

Homestead Farm Association.—This association proposes to divide 50,080 acres of good agricultural laod, situated in Kern county, on the southwest of Tulare lake, and extending to the foot-hills on the west, ioto 313 shares of 160 acres each, to be paid for in thirty-six equal installments of $25 each, payable monthly without interest. The projected branch of the Southern Pacific Railroad passes through the entire tract.

MISCELLANEOUS ENTERPRISES.

Pacific Lumber Co.—Tho Humholdt *Times* says: The object of this company is to buy timber lands, erect sawmills, construct booms and piers, steam tugs and tow boats, or huy them, cut, saw, transport and sell lumber, and do all else needful to carry out the ahove ends. The capital stock is $500,000, in 5,000 shares of $100 each. Place of busioess, San Francisco. Duration fifty years. Trustees, A. M. McPherson, H. Wetherhee, C. J. Breuham and L. L. Rohinson. The company, it is said, will operate on Eel river, and it is understood that the tog heing huilt by McPhersoo and Wetherhee, at San Francisco, has some connection with the plau of operations.

Orleans Hills Vinicultural Association.—This is the title of a corporation, with capital stock fixed at $150,000; place of husiness Sacramento; Secretary, Carl Strohel. The object is to raise, ou a large scale, superior qualities of wine and table grapes in the foot-hills of Yolo county. The grounds are situated about 18 miles west of Woodland, a large portion being at present under a high state of culturc, an old and extensive vineyard heiog sitnated on the same. The husiness, heretofore uoder the management of Jacob Knauth, is sought to he enlarged, and wine making entered into upon an extensive scale. To do this an extensive capital is reqnired, hence the object of incorporating.

California Slate Co.—A company under this name, intended to engage in quarrying at Alvord City, Calaveras county, has been organized under the auspices of S. F. Butterworth, L. A. Pioche, William Alvord, and L. L. Rohinson, who are about to incorporate, haviug leased Flint's wharf and warehouse with a view to furnishing slate in any quantities for roofing, flooring, siding, paviog, table-tops, mantles, etc. At the quarries the company have a boarding-house for the accommodation of their workmen. They have gone down about thirty feet.

The Inventor's Association.—Object, to improvo the mechanic arts, encourage inventive genius, seek out inventions aud improvements of every kind, help inventors, huy and sell real and personal property, etc. Capital stock, $100,000; 2,000 shares of $100 each. Trustees: W. A. Arnold and J. Kindleherger.

Eureka Typographical Union Cemetery Association.—The Eureka Typographical Union No. 21, filed a certificate of incorporation April 24th. The object is to create a common fund among printers of this city and State, for the purchase of land for a cemetery, and to invest money for the members in lands, lots, etc. Capital stock 5,000, in 1,000 shares of $5 per share. Trustees: Frank Smith, E. Armand, J. M. Dormer, P. Nichols, G. K. Hilton, Robert Glen and M. Cuddy.

North Pacific Transpotation Co.—With regard to this remoddled mammoth corporation the Contra Costa *Gazette* of April 3d, says: It succeeds the California, Oregou and Mexico Steamship Co., which was incorporated under the laws of New York, and was a New York Co. The new corporation is exclusively Californian, and will conduct its business in the interest of the Pacific coast. The capital is five millions of dollars. They own nine side-wheel and seven screw-propeller steamers, aggregating about 17,000 registered tounage. Nearly all the vessels are in active service. The officers are—President, Wm. Alvord; Vice-President, Jesse Holladay; Secretary, C. J. Benham; Treasurer, Wm. C. Ralston. Messrs. Holladay and Benham were the executive men of the old company, and will he of the new. This is the most powerful corporation on the Pacific coast, and will soon control the coastwise steam transportation from the Gulf of Anadir to the Straits of Magellan.

Meetings, Elections, Etc.

MINING COMPANIES.

The Silver Cord M. Co. held their annual meeting in this city on Tuesday, April 27th, when the following gentlemen were elected Trustees for the ensuing year: M. J. McDonald, L. J. Lewis, David Fay, E. W. Woolsey and C. W. Fox. The claim of the Co. is near the Golden Chariot, Owyhee county, I. T.

New Idria Quicksilver M. Co.—At the annual meetiug of this Co., held on April 26th, the following Trustees were elected: Wm. E. Barron, Thomas Bell, D. O. Mills, Wm. Burling, W. C. Ralston. Wm. E. Barron, President, and E. Mickle, Secretary.

Noonday M. Co.—An election for Trustees of this Co. was held April 26th, resulting in the choice of the following gentlemen: J. D. Fry, George Coogdon, C. W. Jones, H. P. Wakelee, R. B. Fordham. The Board subsequently organized and appointed J. D. Fry, President, G. Congdon, Vice-President, and Charles E. Elliott, Secretary. From the Secretary's report we learu that 41 tons of ore have been crushed during the past three months, averaging over $110 per ton.

LAND AND HOMESTEAD ASSOCIATIONS.

Land Purchasers' Association.—At the first annual meeting of this Association, held April 26th, the following gentlemen were elected Trustees for the ensuing year: J. W. Cherry, Chas. J. King, J. A. Magagnos, J. F. Crosett, J. M. Haven, Chas. Sontag, H. Keller, E. P. Gray, W. E. Mayhew, George Spauling and George R. Eckley. The Board of Trustees subsequently met and appointed the following officers for the ensuing year: President, John W. Cherry; Vice-President, Charles L. King; Treasurer, James R. Eckley; Secretary, James F. Crosett.

Terminus Farm Homestead Association. At the annual meeting of the stockholders a resolution was passed instructing the Directors to take the necessary steps for the immediate distribution of the property. The following gentlemen were elected officers for the ensing year: President, J. C. Collius; Vice-President, H. M. Rosekrans; Treasurer, J. L. Blaikie; Secretary, I. T. Milliken; Trnstees,—W. B. Cummings, J. Crowninshield, H. Toliken, L. J. Henry and W. A. Davidson.

Celtio and Teutonic Farm Association.—An association under this name was organized on Tuesday; April 27th, by a public meeting held at Kelly's Brooklyn Hotel, on Bush street, which was presided over by Thomas Mooney and addressed by Rev. Father Gallagher, Phillip A. Roach, John Corkery, and Messrs. Wion, Hopkins and Meagher. The object is to purchase large traets of land in this State—some 60,000 acres—with the view of subdividing these tracts into moderate sized farms, to he sold to actual settlers for part cash and part on time. The capital stock was fixed at $500,000, in 5,000 shares of $100 each share. Subscribers may pay up their shares in full on subscribing, or by installments of $10 a month. Dividends from profits to he allowed *pro rata*; $5 entrance fee for each share to be paid on subscribing. The following Committee of 13 was appointed to open a book for subscriptions to the stock, and organize a Board of Trustees, and report officers and by-laws to a future meeting: Daniel McCarthy, F. H. Kast, Charles Moneypenny, Phillip A. Roach, John Corkery, Michael Flood, John Dunn, Michael Grady, Coroclius Collins, John A. McGlynn, John P. Schmitz, Michael Meagher, James Gallagher, Jas. McDonongh, and Thos. Mooney.

Sacramento Farm Homestead Association.—A meeting of the stock-buyers in the Norris Ranch Homestead Association, was held in the Fifteenth District Court Room for the purpose of making inquiry and taking action in regard to the current reports that "large portions of the ranch were nnder water, and that a great portion which was dry was not susceptible of cultivation." A committee was appointed to visit the ground, consisting of Reddington, of Sacramento, Calvin Brown, Civil Engineer at Mare Island, and General A. M. Winn, of this city.

MISCELLANEOUS ENTERPRISES.

Oregon Manufacturing Co.—At the annual election of the Oregon City Manufacturing Co., held at Oregon City, April 24th, the following gentlemen were elected: R. Jacobs, President; L. White, Vice President; W. S. Ladd, Treasurer; Wm. Howell, Secretary; I. Jacobs, and Iram White, Directors.

Mechanics' Mill and Manufacturing Co.—At the annual meeting of the stockholders of this Company, which took place on Monday, April 26th, the following gentleman were elected Trustees for the ensuing year: G. B. Knowles, Asa R. Wells, A. W. Jee, Munson Russell, H. S. Tyler, G. Welton, and George R. Jesse. At a subsequent meeting of the Board, Arthur W. Jee was reëlected President and Treasurer, and Asa R. Wells, Manager. Munson Russell was elected Secretary, *vice* E. A. Holmes, deceased.

Stockton and French Camp Turnpike Co. The following officers have been elected: E. Moore, President; Herbert E. Hall, Secretary; C. W. Kidd, Treasurer. Directors, Samuel Fisher, J. Nichols, John Sedgwick, M. McClenathen, L. M. Hickman. The receipts for the year ending April 22d, amounted to $7,475 33; dishursements during the same period, $8,008,50; balance in the hands of the Treasurer at the commencement of the year, $737 45; halance in the hands of the Treasurer at the closo of the year, $204 19.

Vaca Valley R. R. Co.—The following gentlemen were elected as directors of this company on Saturday last, April 24th: Mason Wilson, President; Richard Thompson, Secretary; A. P. Bernard, Treasurer; A. C. Hawkins, G. B. Stevenson, William B. Davis, G. F. Barker, E. R. Thurher, Joshua Donaldson, M. R. Miller, Thomas J. Jeans and Moses Blum. On taking the chair Mr. Wilson stated that $25,000 was subscribed to the capital stock, leaving but $10,000 or $12,000 to he taken of the full amount required. He felt assured that the enterprise was favorably regarded by the managers of the California P. R. R., from whom hostility had been apprehended. This he regarded as bnt the beginning of a grand sub-central line, destined ere long to extend to Berryessa Valley, and thence northward, affording a ready and cheap outlet for the immense agricultural and mineral treasures of Upper Napa and Lake counties.

Howland's Engine.—The Miners' Foundry is now building hree of Howland's new rotary valve engines, each 5-inch cylinder and 8-inch stroke. They are rated at 17-horse power, and are estimated to run np to 20-horse-power with 80 pounds steam. This engine will prove a decided advance step towards simplification and effectiveness in the steam engine, if its more thorough trial shall continue to realize the estimation now placed upon it by the inventor.

One of the above engines is for Logan & Co., White Pine, to he used with one of S. Howland's quartz grinding mills; and another is for Keefer & Co., of Georgetown, El Dorado County. With the latter goes one of Howland's rotary stamp batterics, just completed at the same foundry.

The Snow Sheds on the Pacific Railroad cover an aggregate of forty-four acres of land, and have required more than 40,000,000 feet of lumber for their construction.

John Le Conte, Professor of Physics in the State University, has arrived from the East, and will take his place in Oakland College during the ensuing term.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, May 1, 1869.

Financial.

Our local money market is still quite close, but not to any extraordinary extent. As it had been anticipated for some time, business men prepared to meet the occasion. The Savings and Loan Banks have their balances drawn down to a low margin, and have ceased making loans. They have refused offers of 1½ per cent. per month on good real estate securities. An immense amount of improvements are going forward in this city, calling for the use of large sums, while other enterprises concur to draw largely upon our available current funds. Commercial transactions do not keep pace with other pursuits just at present, but the jobbing trade is fairly active, and business generally is healthy and promising.

Bullion is in fair supply, while the Branch Mint is kept actively at work furnishing coin. We quote gold bars at 899@895, and are generally required for coinage. Silver bars sell from par to 1¼ per cent. premium, and appear to be in demand for shipment to China, in place of gold. Currency bills on Atlantic cities pay 29¾ per cent. premium on gold; coin drafts are negotiable at 2 per cent. premium; telegraphic transfers are nominal at 3¾ per cent. premium; sterling exchange, 48¾d; commercial exchange, 49¼d; Mexican dollars, 7@7⅛ per cent. premium. Gold in New York, April 30th, 134⅛. Legal tenders with us, 75@75⅛.

To say that the weather vouchsafed to us during the past ten days has been exceedingly fine would scarcely do justice to its surpassing loveliness. Every interest has been benefited by this timely boon. The growing crops are now beyond the reach of ordinary disaster and promise much the most abundant yield ever known.

We are under obligations to Mr. J. M. Good, Adjuster of Duties, for the following late decisions made by the Secretary of the Treasury: Cigars, cigarettes and cheroots must be put up in boxes and stamped before leaving the custody of the Custom-House officers; cigarettes, when imported in bundles, must be put up in boxes of 600, and duly stamped; cigarettes weighing more than three pounds the thousand are to be taxed the same as cigars; mineral waters, although imported in bottles holding a little more than one quart, are not chargeable with additional duty. Pearls and pearl shells, the product of American fisheries, are duty-free, although they may be shipped across the Isthmus. The penalty exacted for stamping an unstamped instrument, amounting to $50, is not subject to remission. Vessels carrying domestic and duty paid goods may clear direct for Wrangle Island and Tongass, without going to Sitka. The custom officers at Tongass are authorized to enter and clear vessels from and to foreign ports, and receive duties. Registered vessels may engage in the fisheries, and all fish caught by American vessels, although cured with foreign salt, to be duty free. No drawbacks will be allowed when entry is made after the goods are laden. The restriction against the importation of firearms in Alaska has been removed, or rather transferred to the discretion of the military commandant.

A Package Express Company has been inaugurated in this city, under the auspices of D. V. B. Henairic as President, T. A. Mudge as Secretary and Treasurer, and H. B. Murray as Superintendent. The object is to deliver packages to any part of the city. In addition to a rebatement of nearly 50 per cent. on rates heretofore exacted, passengers by rail and steamboat will be freed from the importunate and rude solicitations of hackmen and boarding-house runners, as the company will have an agent on all roads and steamers who will give receipts for baggage and parcels, which will be conveyed to their destinations by the company's wagons. It is another step in the proper direction.

City Stocks.

With regard to miscellaneous securities, transactions have been limited during the past week, the market being flat, particularly in Insurance stocks. We note sales of 50 shares San Francisco Gas Co. stock at $75, and 65 shares Spring Valley Water at $66 50@66 62½ per share. At the close, 10 shares Napa Wood Co. stock sold at $30 per share. The Pacific Bank and the North Beach and Mission Railroad dishurse their usual monthly dividends to-day. The San Francisco Gas Co. and the Sacramento Gas Co. also dishurse their monthly dividends to-day.

The returns of our local insurance companies to the Internal Revenue department for the month of March and previously this year have been as follows, upon a currency basis of 74 cents on the dollar for the month of January, 77½ cents for February and March:

	March.	*Previously this year.*	*Total.*
Pacific	$106,451	$166,621	$273,072
Union	60,911	74,185	135,096
Fireman's Fund	49,966	43,107	*93,074
California	12,351	20,804	33,155
Merchants' Mutual Marino...	26,653	40,657	67,310
Occidental	27,579	30,166	57,745
Home Mutual	13,987	27,381	41,368
Peoples'	13,481	28,672	42,153
Total	$311,379	$431,593	$742,972
Same time in 1868	184,398	321,756	506,154
Increase in 1869	$126,981	$109,837	$236,818

The above statement shows the gratifying gain of $102,137 over the receipts in February. The receipts of the several companies in March as compared with February show the following difference:

	Increase.	*Decrease.*
Pacific	$20,641	.....
Union	28,835	.....
Fireman's Fund	29,728	.....
California	625	.....
Merchants' Mutual Marine	10,993	.....
Occidental	9,945	.....
Home Mutual	339	.....
People's	1,939	.....

The receipts of the city railroads for the month of March and previously this year were as follows:

	March.	*Previously this year.*	*Total.*
Omnibus	$24,510	$42,457	$66,967
North Beach & Mission	24,019	40,908	64,927
Central	15,159	27,383	42,542
Front Street, Mission & Ocean	8,979	15,581	24,560
Market Street	11,545	19,383	30,928
Potrero and Bay View	2,993	4,132	7,035
Totals	$88,115	$149,844	$237,959
Same time in 1868	76,727	136,107	212,834
Increase in 1869	$11,388	$13,737	$25,125

As compared with the total receipts in February, we find a gain of $15,114. The receipts of March as against February show the following difference:

	Increase.	*Decrease.*
Omnibus	$4,289	$2,834
North Beach and Mission	4,020	.....
Central	2,550	.....
Front Street, Mission and Ocean	1,247	.....
Market Street	2,948	.....
Potrero and Bay View	780	.....

Mining Share Market.

With reference to the mining share market for the period under review, we note a continued strong activity during a greater portion of the week, and at improved rates; however, a slight reaction took place on Thursday, just at the culmination of a considerable "corner" in Sierra Nevada stock, which was the occasion of some little flutter in the Board. Otherwise, the market is in a very hopeful condition, and the continued fine developments in the Hale & Norcross claim in its lowest levels, has had the most encouraging effect upon all the Comstock claims. Of White Pine stocks we note a rather better business. The following sales were effected during the past week: 85 shares Brodt at $2@1 50; 64 Pocotillo, $17; 60 Phœnix, $2 50; 10 Virginia, $15 s. 30; 100 Silver Wave, $10 s. 30.

AMADOR (Cal.)—ruled at $290@285. This mine continues to look as well as usual....ALPHA improved from $24 50 to $41, and closed at $40....AMERICAN was in large request, advancing to $56 50, and closing yesterday at $56....BELCHER also sold to a more than usual extent, within a range of $17 50@24 50, closing at $22 50.

CHOLLAR-POTOSI—was in moderate request, rising from $201 to $250, and at the close selling at $243. During the week ending April 23d, 1,000 tons of ore were extracted. The Blue Wing portions of the mine are showing better ore than was in sight a week previous to the 23d, and the drifts on the fourteenth floor south and the twentieth floor north, exhibit the principal improvement. The New Tunnel stope promises well, and it is expected will yield a larger quantity of good milling ore than has been in sight for several weeks. During the twenty-four hours ending with the 28th inst., fifty-five tons of ore were extracted. Four mills are now employed in reducing the ore coming from this mine. Eleven bars of bullion, valued at $29,860, were received on the 23d April.

CROWN POINT—improved from $56 50 to $68, and closed yesterday at $67. The bullion returns from the amount of ore on hand at the time of the fire in the mine aggregates $12,560....KENTUCK advanced from $248 to $270, closing at $259. The amount of bullion received for account of the month just closed is $18,377 73....YELLOW JACKET sold within a range of $58@70, closing yesterday at $65 50. Telegrams of the 29th state that "hoisting ore was re-commenced last night from the upper levels of the Kentuck mine, after a lapse of over three weeks. Work was re-commenced in the Yellow Jacket at 6 o'clock this morning. They have been removing waste and caved matter to-day, and will hoist ore to-morrow. The air is good all through the mine. In the Kentuck the air is also good; but the draft being south from the Yellow Jacket, the air in the Crown Point is bad, preventing work. Some gaseous smoke is still coming from the shaft, but the fire is thought to be all extinguished."

HALE & NORCROSS—ruled at $123@152, closing yesterday at $151 60. During the week ending April 24th, the product of ore from the fifth station levels amounted to 191 tons, being an increase of 110 over the previous week, and the value per ton also shows an assay improvement of nearly $15—from $110 to $123 60. The report for the above week is as follows:

Levels.	*Tons.*	*Assay value.*
175 feet	295¾	$14,012 50
Third station	56¾	2,911 27
Fourth station	562½	27,163 12
Fifth station	191	23,584 68
	1,105¾	$67,671 57

During the same week they delivered 918 tons to the mills, leaving on hand 1,092 tons. The continued work in cross-cut No. 3 is developing an excellent quality of ore, and the width of the vein has not yet been ascertained. The breasts between cross-cuts Nos. 2 and 3 look very well, showing twenty-one feet of ore between the walls. The face of the south tunnel on the fifth level is now fifteen feet south of cross-cut No. 5, and on the 27th of April there was a streak of ore in the face of the drift some two feet wide, the ore being found east of the east clay wall and assaying $96 to the ton. Both "raises" above the third level are reported to show excellent ore in considerable bodies lying east of the vein heretofore worked. The total bullion product for March account has been received and foots up $74,888.

IMPERIAL—met with moderate sales, improving from $70 to $79, and closing at $77. The bullion receipts for April account to the 27th foot up $20,929 61. Nothing of an encouraging nature has yet been found in the lower levels running from the Imperial-Empire shaft.

OPHIR—was in the market to a considerable extent, at slightly varying rates, closing at $33 25. On the 28th of April the drift had been extended a distance of 228 feet, and the clay is found at the bottom of the drift, while at the top the rock is cut up with clay seams. The entire face of the drift is at present very dry.

WILLAMETTE UNIVERSITY.—We observe by a new prospectus of the medical department of this institution for 1869-70, that important changes have been made in the professorships, several members of the faculty as named in a previous circular having "resigned for peculiar reasons," while Dr. Carpenter takes the position of Dean. Owing to other engagements, Prof. Veatch has vacated the chair of chemistry and toxicology.

OPERA CLASSES, Telescopes, Magic Lanterns, Drawing Instruments, Microscopes, etc., at $5 each C. Muller, 215 Montgomery street, Russ Block. *_*

JUSTICE TO THE JESUITS.—Although the Jesuits were at different times expelled from all the courts of Europe, for alleged political malpractices, it must be admitted that they rendered one great service to mankind. They discovered the medicinal properties of the famous Bark that has so long borne their name, and which is now one of the most potent ingredients of the celebrated PLANTATION BITTERS, the most popular tonic of modern times. Of this wonderful vegetable product, now known as Calisaya Bark, Messrs. P. H. Drake & Co., the proprietors of the Bitters, are the largest importers on this continent. It contributes materially to the efficacy of the best invigorant and anti-bilious preparation ever concocted, and in association with various other botanical tonics and alteratives, and with pure St. Croix Rum, is accomplishing such cures of dyspepsia, liver complaint, periodical fevers, constitutional feebleness, &c., &c. *_*

PIONEER LAND AND LOAN ASSOCIATION.—CAPITAL $1,000,000—INCORPORATED FOR 50 YEARS. This new incorporation is under thoroughly responsible management, and offers greater inducements for the legitimate investment of money than any other Association in the State. Books, with prospectus, can be obtained at the office of the Company, 304 Montgomery street. The President is Fred MacCrellish, Esq., and the Secretary, J. C. Duncan. An interest of 1 per cent. per month is allowed, and also half-yearly division of profits, which will doubtless be large. *_*

AMERICAN MACHINERY IN BRAZIL.—In consequence of our high prices, Brazilians, anxious to buy American machinery, have found it profitable to send an American sample to France or England, and get machines made there after these American models, cheaper than we can make them.

LEAD pencil marks on zinc, will last longer, when exposed to the water, than the same marks on anything else. Hence the superiority of zinc for tree labels.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

TARSHISH.—From the *Miner*, April 17th: The agent of the Tarshish property has sent to San Francisco two parcels of ore, first and third class, to be worked by the Paul & Wood dry amalgamation process as a test. * * We have news by private letter that operations will be at once resumed on the mine, and that reduction works will be put up during the season.

M. C. MILL.—Work is progressing rapidly on the flume, and on the inside rigging of this mill. It is believed that two weeks more of favorable weather will enable them to set the quartz grinders in motion.

AMADOR COUNTY.

VOLCANO.—*Ledger*, April 24th: Mining just now is very brisk. On the flat a number of companies are at work, and the claims are paying well.

ANACONDA—PINE GROVE.—On Monday we visited this mine, and were highly gratified at what we saw. The shaft is covered with a large and convenient building, well lighted, and kept as neat as a sitting room. The engine is a powerful one, and as noiseless as a sewing machine. The shaft is down 170 feet, and they are taking out excellent rock—some that we looked at was thickly studded with gold. The yield of sulphurets is large.

SOROCCO.—This mine, between Pine Grove and Volcano, is now paying handsomely. We learn that it is the intention to sink 100 feet deeper.

CALAVERAS COUNTY.

UNION.—*Chronicle*, April 24th: Peters, Champion & Ahnert, engaged in removing the water from the old Union shaft diggings, are progressing rapidly. The water has already been reduced to the top of the old levels. The company calculate to have the mine free of water in a month.

Smith & Co. have purchased the old Red Bird mill, Chili Gulch, and are moving it on to their quartz lead in Jackass Gulch. The battery consists of five stamps, and is intended for prospecting.

RAILROAD FLAT.—Work is steadily progressing on all the claims. The machinery is being transferred to the main shaft of the Petticoat. As soon as the removal is completed, operations will be resumed. From Washington Flat, San Andreas, and Angels, we are in receipt of favorable intelligence. In Lower Rich Gulch, Alexander & Co. have got their mine in splendid order. The steam hoisting works of the Palomo are rapidly approaching completion. Gravel mining is being vigorously prosecuted. Brackett & Co., Shaw, Hatfield & Co., Paul & Co., and many others are doing well. The sale of gold dust in this town from gravel claims alone, averages about $16,000 per week.

INYO COUNTY.

CERRO GORDO.—Sacramento *Reporter*, April 16th: A letter from these mines says that from two to three tons of lead and silver bars, worth from $300 to $500 per ton, are produced every 24 hours by the smelting works of Belshaw & Co. The ore is from the Union, the Ygnacio, Belmont, and San Lucas mines. The writer says that a large amount of bullion has been shipped from these mines, of which no mention is made in the papers. He thinks the reason is that the men who own the only smelting works there are fearful of competition.

LOS ANGELES COUNTY.

SOLEDAD.—Los Angeles *News*, April 24th: Dr. Colombo reports that the Enterprise mill is crushing the rock from the Rattlesnake mine, with favorable results. The Doctor made a contract with the mill for hauling and crushing 300 tons of the Champion rock at $15 per ton. They have a large amount of first class ore ready for crushing, and are mining night and day. It assays upwards of $50 per ton, and the vein is 4 feet 8 inches wide, and the ore easily extracted. The Eureka is down about 120 feet, with very rich rock, three feet wide. Polk & Kabler are getting out $35 rock faster than they can crush it with a ten stamp mill.

MARIPOSA COUNTY.

MYLAR LODE.—*Gazette*, April 23d: This quartz vein, situated near Pine Creek, three or four miles from Granite Springs, is being worked by Messrs. Bowen & Bennett. They are crushing rock that pays them fair wages above expenses.

BUCHANAN.—Stockton *Gazette*, April 10th: Hughes & Keyes shipped eleven tons of Buchanan mine copper to-day on the schooner Maggie Robinson.

MENDOCINO COUNTY.

Ukiah *Herald*, April 9th: Yesterday we were shown a prospect obtained from a single pan of earth, in which 20 fine particles of gold were visible. We were told that some six or eight pans were washed out with similar results. There are two gulches from which these prospects are obtained, within three or four miles of Ukiah, in the mountains east of the valley.

NEVADA COUNTY.

NORTH STAR.—Grass Valley *Union*, April 21st: We yesterday heard that the North Star Co. were taking out some very rich rock, and went down to take a look. The rumor was not exaggerated. At the end of the drift in the sixth level the ledge shows beautifully in gold, running in seams, while between are heavy sulphurets of great richness. This is in the western extension and about 600 feet from the shaft, in the ground lately purchased by the Co. In the stope, from which the rock we saw came, the sight is a glorious one, the whole thickness of the ledge being interspersed with gold. The ledge nearest the foot wall is excessively rich for about six inches in thickness, and the rock is of dark color, the rest of the ledge, of a thickness of from eighteen inches to two feet, is lighter, with gold plainly visible. This rock, as far as can be seen, continues thus rich.

BLOOMFIELD AND GRANITEVILLE correspondence:—The North Bloomfield Co. are now running 1,300 inches of water through their 30-mile ditch. The water will be increased to 2,500 inches as soon as the banks become firm. At the Co's mines are eight pipes in operation day and night. At Relief Hill, three miles distant, the Eureka cleaned up last week. At Graniteville, quartz mining is a little dull. The "Jim Crack," or "Erie Company" have suspended operations, on account of water in their shaft. As soon as the roads will admit, the Co. intend procuring a pump. Their rock pays them well, and they have a fine ten stamp mill directly over the mine. The Birchville mill is running, and is amply repaying the owners for running their long tunnel. The Black & Young mill is running on the Banbury & Stacy rock, which has paid well from the first run. Capt. Erwin has recently purchased the interest held by Banbury, and the mine will be worked with a full force. The Norfolk Shaft Co. have suspended on account of water, their pump being too small; but that will be replaced with heavier machinery, and the mine will go ahead. Some of this rock shows plentifully in free gold.

EUREKA.—Same of 22d: The shipment yesterday was valued in round numbers at $23,000, and does not include the gold contained in the sulphurets.

UNION HILL MINE.—The engine shaft has attained the depth of 260 feet, and preparations are being made to commence drifting. There are about forty men employed underground. The ledge throughout averaged about three feet, and looks well. The Co. have sufficient rock to last twelve months, without the 100 feet recently sunk through profitable ground. They are now,—says Capt. Faull,—"crushing 30 tons rock per day, worth $12 per ton.—$360; this multiplied by 24 days in a month, will make, say, $8,640. Working expenses, say $4,000. For material to work the mine, say $2,000—add working cost $4,000, will make total expense $6,000, against $8,640 returned, thus leaving a profit of $2,640.

ALLISON RANCH.—Same of 23d: The mill has been running eight stamps for the last ten days on the rock from the old waste pile. On Wednesday the pumps in the south shaft were started, and will be kept working constantly. The mine will soon be drained.

The Wisconsin mine has been pumped out, and this summer the ground will be thoroughly prospected.

Grass Valley *National*, April 20th: In the North Star, over $1,000 was taken out to-day in specimen rock. The ore comes from what is known as the Edmonton ground.

RICH DIGGINGS ON SCADDEN FLAT.—A ledge of decomposed quartz has been found, which, in the language of our informant, Thomas Scadden, "is perfectly lousy with gold." The ledge is from four to eight inches in width. The dirt, besides the rock, prospects from 50 cents to $1.50 to the pan.

HIGGINS.—Same of 21st: This mine, leased and worked by Frank Morse, continues to do well. They are down 160 feet and still sinking. The first level, 75 feet, is open 100 feet each way, and on the second level they have drifted 90 feet south and 60 feet north. The ledge shows a width of three feet. The hoisting, pumping, and crushing are done by water. The mill, eight stamps, turns out $1,500 every six days.

HOPE GRAVEL MINE.—Same of 22d: The new shaft has been sunk 140 feet, and will strike the lead at 90 more. Men are putting up the pumping machinery. There will be two 11-inch pumps, driven by an engine of 12-inch cylinder, with a 14-foot fly-wheel. Pay dirt will be taken out by June 1st.

ALLISON RANCH.—John Dennin & Co., working on a contract, have crushed 70 tons of rock from the old dump-pile of the Allison Ranch mine, and obtained 40 ounces of gold, worth $17.50 per ounce.

NORTH STAR.—Same, 23d: J. H. Crossman, Superintendent, informs us that yesterday the ledge in the Edmonton ground was stripped, and to-day they are taking it up. It proves even richer than reported. The rock is literally studded with gold.

Transcript, April 22d: Cozzens & Co., on the Little York ridge, are working four sets of hydraulic claims, and doing remarkably well. The claims above them on the same range are also yielding handsomely. Mr. Barber, the owner of the Mohawk mine, arrived in this city yesterday, and will start up the works soon. He proposes to sink 70 feet deeper upon the ledge. This mine is located on Gold Flat, and has yielded some very rich rock.

GIANT POWDER.—Some 20 to 30 miners left the Banner mine yesterday, or were discharged, because they refused to use Giant Powder in blasting.

BUCKEYE.—Same of 23d: These claims, on the banks of Greenhorn Creek, opposite Hunt's Hill, are yielding handsomely. The owners are running three pipes and are getting better returns than for years.

KANSAS MINING CO.—Same, 24th: This Co. last fall put on the ground a 15-horse engine, a 6-inch Cornish pump, and the most complete prospecting works in the country. They sunk an incline 500 feet, when they became satisfied that they were too high. After going 50 feet below the bed rock, a tunnel was commenced at the bottom of the incline, which has been run a distance of 200 feet toward the ridge, and they have now struck into boulder ground, which is considered a first rate indication of a channel.

MANZANITA.—*Gazette*, 22d: We visited these claims, owned by Marselus & Maltman, yesterday. The owners employ 22 men, and use 700 inches of water. Three pipes are used, the largest having a four and a quarter inch nozzle, and the others three inch nozzles. The ground will last for years.

OMEGA.—Same of 24th:—A gentleman who came down yesterday informs us that times are quite lively, and the miners both at Omega and Diamond creek are carrying on operations upon a larger scale than for many years. Twenty men are employed at the Prescott hydraulic claims; six in the Horn & Jones claims; Dr. Temple employs eight to ten men; Bowman seven, and the Cannon brothers three or four. Cal. Kirtley and Van Wyke, at Diamond creek, each employ five men. Kirtley made a partial clean up on Thursday, after fifteen days' run, and took out 92 ounces of retorted gold. None of the other companies will clean up until the close of the season.

Quartz mining has also been quite active for some time past. The mill of the Salathiel Co. has been for some time crushing rock from the Tecumseh ledge, which is said to have paid well. The Salathiel ledge is looking well, though work had to be suspended during the late storm. The Comanche, owned by John Dill and others, is looking finely, and turning out large quantities of first-class ore. The work is also progressing on the Fidelity and Enterprise ledges, with good prospects.

PLACER COUNTY.

COLFAX.—Auburn *Herald*, April 24th: "Our mining prospects are more encouraging than at any former period. A few days ago I saw in the hands of Wm. Gillis some of the richest specimens of quartz yet found in this section. I was at a loss as to which predominated, the quartz or gold. The ledge is 1½ miles from Colfax. The extensions on both ends have been located and their owners are at work. The 'Rising Sun' has found richer rock and a better defined ledge in their lower level running east. The 'Colfax' adjoining, have commenced work. They intend to take out a quantity of rock and have it tested by mill process. The Lafayette Co., on the same ledge east, have commenced work in earnest. The controlling interest has fallen into the hands of Bill Hamilton, of the Telegraph stage line. The Montana Co. are soon to erect hoisting works and a mill. The 'Live Oak' claim, four miles below Colfax, has been purchased by Messrs. Egbert & Hodgsden, who possess the means to work it in shape. The ledge has improved both in size and richness. The 'Eureka Co.' has again commenced operations. Their claims are one mile northwest of town. Considerable work had been done last fall. A shaft was sunk to the depth of 75 feet. Work was temporarily suspended, for some cause, a short time ago."

Stars and Stripes, April 22d: A boy, while playing on the bank of Auburn ravine, near Steinley's brewery, last Monday, picked up a piece of gold worth $5 75. The late rains have laid bare the bedrock in many places.

SIERRA COUNTY.

NED LEONARD LEDGE.—Downieville *Messenger*, April 24th: The one hundred tons of rock, the crushing of which has just been completed at the Gold Bluff mill, yielded 83 ounces of bullion. Leonard has been running a lower tunnel, and expects to tap the vein in a few days.

GOLD BLUFF.—The company have completed their air shaft, and are prepared to take out rock for crushing. The want of ventilation has heretofore embarrassed them. The shaft they have raised is about two hundred feet, opening into the workings above.

Forrest City correspondence of same: "Business is still dull. Over the ridge, in Alleghany, they are more hopeful, having, as report says, struck good pay in several of the mines lately."

SISKIYOU COUNTY.

KNAPP—ON HUMBUG.—Yreka *Union*, April 17th: The owners of the ledge had forty-eight tons of rock crushed this week at the Sucker Creek mill, which yielded $2,800, being nearly $60 per ton.

ORO FINO.—We understand that a company is prospecting a quartz ledge. If it holds out as well as it prospects at the surface a mill will be erected this summer. The scarcity of water is everywhere turning the attention of miners to quartz.

Messrs. Spidell, Horsely & Co. are erecting an arastra on French Creek to prospect a ledge recently found. The arastras will be run by water power.

ON THE KLAMATH.—We learn from R. Humphrey that considerable money is being taken out along the Klamath.

SAN BERNARDINO COUNTY.

TEMESCAL.—Los Angeles *News*, April 24th: The shaft is down over over hundred feet perpendicular, and the drift is being pushed southwest on the vein, which looks well; and they are also drifting northeast with good prospects. The formation of the country is the same as that at Cornwall, and the best ore assays from 45 to 50 per cent. per ton. There are about thirty-five good Cornish miners at work. The company intend erecting extensive works as soon as the law suit shall be decided.

YUBA COUNTY.

PENNSYLVANIA.—Marysville *Appeal*, April 24th: Some unexpected difficulty occurred while putting down the new 12-inch pump, and a second one was necessary to ascertain the cause. This consumed considerable time, during which the mine filled up considerably with water. At last accounts the second pump was laboring to drain the shaft. The hopeful expect the matter will be all right in due time.

COLORADO.

CHICAGO CREEK MINES.—Central City *Register*, March 25th: We visited this locality last week. The Pulaski has been opened to a depth of ten or twelve feet, and shows a crevice between walls at least four feet in width. The outcrop is large and strongly marked for a considerable distance along the surface. The next lode that we visited was the Chemung County. At the discovery was a shaft some twenty feet deep. They have several tons of ore out, some of which looks rich. Near this lode is one recently opened, called the C. P. R., with which we were not favorably impressed. It is a large vein, but has not yet produced any rich looking ore. About half a mile west is the Grant, a wide, strong vein, the outcrop resembling that of the Pulaski, of which it is an extension. The shaft is twelve feet deep, and has produced fine-looking ore. We next visited the Tiger lode. It shows a well-defined vein, three feet in width. The Charter Oak lode has one shaft on the discovery claim some twelve feet deep. The pay vein has varied from twelve to eighteen inches in width from the surface down. The ore is principally sulphide of silver. It has assayed as high as $385 coin, per ton, from a five-pound sample taken for an average. About 100 feet west, is the Tribune, by many thought to be the same vein. Messrs. Thorn and Bangs are now raising a quantity of ore from each, to be shipped to Newark, N. J., for reduction. Cameron and Moore are sinking on a load about half a mile west, supposed to be on the same vein. At the head of Magnet Gulch, one-and-a-half miles from the Charter Oak, is the Silver Bluff lode, said to be one of the best in the

district. The Silver Cup, the Jersey, and the Big Ute, are said to promise well.

Yesterday we saw a bar of silver bullion weighing about 32 ozs., taken from a small lot of Circassian ore by Dr. Blatchley in his new pan. It was over 900 fine....Mr. Salisbury is meeting with success in his development of the Mollier property on the Mammoth. The ore is constantly growing richer.

The arrival of a monster slab of silver—they call it a *button*—from Georgetown, by express, attracted many visitors last evening. Its Troy weight is 532 lbs., currency value $10,200, and it is the gross yield of 29 tons of ore from the Coin and Brown lodes.

PIERCE LODE.—Same of April 8th: Messrs. Remine, Elliott & Pierce own 800 feet on the lode, and have six shafts, the deepest of which is 260 feet. The discovery shaft is sixty feet deep and shows a crevice sixteen feet in width, with solid, regular walls from top to bottom. There is a large quantity of surface ore in sight, which yields, under stamp, six ounces of gold per cord. A small lot has recently been crushed. They are now raising from the deepest shaft, nine to to twelve cords of ore per week, which runs under stamps eight ounces gold per cord, tho whole width of the crevice being crushed together. Selected ore will run as high as fifteen ounces per cord. The improvements on this mine have cost some $30,000, all of which has been made out of the mine as they went along.

STOUGHTON LODE—WARD DISTRICT.—A lot or three hundred pounds was recently crushed and sampled, which gave a yield of eight and a half ounces gold per ton.

BAKER MINE.—This is said to be turning out more ore than ever. The company will put up roasting furnaces in the Spring.

THE VETO—GILSON'S GULCH.—This new silver lode is being worked with great success. An assay of selected ore gave $1,089.01 per ton of two thousand pounds. It has a vein of paying ore from six to twelve inches wide. The assays on which the different lots of ore has been sold have been as follows: $568.62, $412.02, $349.45 and $439.66 per ton of 2,000 pounds.

THE "TERRIBLE."—Georgetown correspondence: The shaft is 185 feet deep. The company employ thirty men, and are raising about three tons of first class, and thirty-six tons of second class ore every week. The first class ore yields on an average $550 per ton. The second class is piled up near the mine there to remain until dressing works are erected. All the first class ore is hand-dressed and crushed at the mine, put up in canvas sacks, 105 pounds in each, and shipped to Newark, N. J., for reduction.

CLEAR CREEK.—*Herald*, April 7th: All the old Creek and Bar mines are being worked. The Wright Clanfield claims open out well; three men taking out six ounces in three days. Mixer & Schwartz, on Illinois Bar, took out six ounces, working two men three days. Dr. Mead is working on Chicago bar. Maj. Conner is taking out pay on Spanish Bar. C. C. Bangs has two tons of rich silver ore, from his lode on the head of Chicago Creek, sacked and ready for shipment to the Smelting works in New Jersey. They are finding native silver in the Silver Bluff lode (same locality) at the depth of 30 feet.

Parties working on the Jones claim, on the California or Hidden Treasure lode, have found good pay. The ore is now yielding 8 ounces per ton, and is improving.

WILSON & CASS CO., GEORGETOWN.—This Co. is working on the old Griffith lode, and has found a large body of rich ore. The vein is continuous from the top to the bottom of the shaft—now 100 feet deep—and is over one foot and a half thick. The ore is a heavy galena mixed with brittle silver, and contains from three to seven hundred dollars in silver per ton. Between five and seven hundred tons of ore is now lying at the mine, waiting treatment in the new reduction works, which will be completed as soon as possible.

THE BURLEIGH TUNNEL.—Georgetown *Miner*, April 1st: This enterprise is looked upon as of greater importance to the mining interests of Colarado than any other ever projected. At the present time the advance is two feet per day. The blasting is done by electric fuse and battery, and the drills are driven by compressed air. On Monday last, while we were present, the last hole in the heading necessary to complete the number for the blast, was drilled 32 inches in depth in seven minutes.

IDAHO.

Owyhee *Avalanche*, April 17th: The Rising Star Mill at Flint has suspended operations, and the Superintendent gone below. Scarcity of ore is alleged as the cause of suspension. Men are at work in the mine.

Owing to the state of the road to the mines, the Ida Elmoro and New York mills have shut down for a few days, but it will not be long before the ore will commence coming down the mountain again.

Idaho City *World*, April 8th: The scarcity of water still retards general mining operations in this district and in the basin generally. There never has been a season of such thorough preparation for big mining, and it only requires an unusual supply of water to start in the work; but the prospects, we regret to say, are not favorable for a fair season to the miners.

Silver City *Tidal Wave*, April 20th: The Baxter mine has out about sixty tons of ore, taken from the shaft and drift. They will make a crushing in the Sinker mill as soon as the road opens....An increased force of men will be put on the Baxter mine soon ...The Oro Fino grade, which was nearly free from snow last week, is drifted full again.

MONTANA.

Helena *News Letter*: Immense quantities of pay dirt were drifted out on Bear Creek, 100 miles southwest of Helena, during the winter, and the working season will open there more lively than ever before....Two companies are now working on the "Lone Man" lode, McClellan Gulch, both highly flattered with the indications....$1,100, gold, was paid Thursday for a half interest in a claim at the head of Ten-Mile Creek. The Lindsley Mining Co. are operating 10 or 12 miles below. The entire creek—supposed to be generally rich on bedrock—will be protected the coming summer.

MOOSE CREEK.—A letter has been received by James Thompson, of Deer Lodge City, stating that new and rich diggings have been discovered on Moose Creek, miners having made during the winter from $50 to $100 a day with rockers. A number of letters confirming this had been received at Missoula Mills. These placers must be in northwestern Montana, or just over the line in Idaho, about 300 miles from here.

NEVADA.

HUMBOLDT.

WINNEMUCCA.—*Register*, April 17th: L. D. Webb, Major Starling and others are organizing a company for the purpose of running a tunnel into the center of Winnemucca mountain. The portion of the mountain through which the proposed tunnel will run is a perfect network of mineral veins, varying from one to four inches in width, and all rich. It has long been the opinion of miners that these small veins are merely feeders leading to one or two large ones near the center of the mountain.

ECHO DISTRICT.—Prospecting parties are engaged six or eight miles from Unionville. Persons having old locations, abandoned two or three years ago, have renewed their claims, established their boundaries, and gone to work with renewed energy. The railroad runs alongside of this district, and affords cheap transportation of ores to the Truckee or California. We understand that the Alpha Co. has ore shipped to the Truckee for $6 per ton.

GOLCONDA STATION.—M. Meador informs us that the Negus mill has been running for a few days on tailings with excellent results, the yield being better than that obtained from first working. The ores of this district are refractory; but if tailings are permitted to remain exposed to the atmosphere, chemical changes take place which render amalgamation comparatively easy. Mr. Negus shipped this week 1,640 ounces of bullion, the result of a short run on tailings.

The Arizona and the Silver Mining Companies have made new arrangements beneficial to both. Communication will be opened between the mines for ventilating purposes, and the Silver Mining Co. will have the privilege of using the shaft and track of the Arizona for getting ore to the surface.

EL DORADO DISTRICT.—Morrison and Lambing have been developing the Corinth ledge. The ledge is 12 feet wide, and crops out boldly for 1,000 feet. From tests made, it is supposed that the ore will average $40 per ton.

REESE RIVER.

Austin *Reveille*, April 20th: During the week ending Saturday, the 17th instant, the Manhattan mill in this city produced 32,300 ounces of bullion.

FINE ORE FROM LANDER.—Same of 22d: Stopping for a few minutes last evening at the Manhattan mill we were shown lots of wonderful ore from several mines of Landen hill. That produced by the Magnolia was a noble sulphuret ore, much of it having the warm tint of ruby, and brilliant faces of copper pyrites resulting from the abundant silver fahlerz. The Troy is producing equally valuable ore, as is also the Florida. These mines lie in a group, and their remarkably rich ores are identical in appearance and composition. Perhaps the mines of the Lane and Fuller Co. are producing the richest and purest sulphuret ores of any in Lander Hill. The splendid developments in the Buel North Star are marvelous in the extent of the body of ore uncovered no less than its superior quality. We were told that some five tons of its first class ore, just reduced at the mill, had yielded a pulp assay of about $1,025 of silver to the ton. The great body of ore uncovered in the Buel North Star has been estimated at a quarter of a million dollars. Good work is doing in a number of other mines in Lander Hill, as well as by two important companies at Yankee Blade, and the general prospects of the mines in this district are highly encouraging.

MAMMOTH DISTRICT.—Same of 21st: We have been presented with two specimens of ore from the Lisbon claim. They are fine chloride of silver, equal to anything from White Pine. The claim is two miles south of the Marble Falls ledge.

PEORIA DISTRICT.—Belmont *Champion*, April 17th:—Up to the present time upwards of 40 different ledges have been located. The ledges are large and well defined, and the ore assays all the way from $43 to $1,500 per ton. An average of the ore from the Champion mine yielded $165 per ton, and that of the Mammoth $108 per ton; assays from the Summit mine gave a yield of $1,500 per ton; Illinois ore assays $350 per ton; assays of ore from the White Cloud ledge shows a value of $659 per ton. The principal work in the district has been performed upon the Champion, Mammoth, Peoria and Summit claims, all of which bear evidence of being true fissure veins.

EL DORADO SOUTH.—Work progresses steadily upon Leon & Co's El Dorado South mine, and ore of the highest grade is daily added to the already large supply on their dumps.

REVEILLE DISTRICT.—We are informed that the population of Reveille continues to increase rapidly, and that work is prosecuted vigorously throughout the district.

WILL START UP.—The Belmont Co's mill will probably start up during the coming week.

WASHOE.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

HALE & NORCROSS.—*Enterprise*, April 20th:—The Co. now have ore everywhere, from the very bottom of the mine up to the second level, and can take it out in almost unlimited quantities. The yield of the mine for next month will probably be greater than for any month since the opening of the mine, and we see no reason why there should be any falling off for many months. The air in the lower level is now excellent.

SIERRA NEVADA.—Same of 21st: The ore in the surface opening of the Sierra Nevada is increasing in richness as it is followed westward, also in drifting upon it to the northward. The mill is being run up to its full capacity night and day. A handsome yield may be expected from the next clean up.

FLOWERY LEAD.—The Flowery lead continues to yield a large amount of excellent ore from both the shaft and incline. The mill is kept in constant operation.

PINE GROVE MINES.—Same of 22d: A new and valuable lead has been discovered called the Dolores, situated five miles south of the town of Pine Grove. It presents the same appearance as did the Comstock on the surface, the ore being black sulphuret of silver and free gold. The pay streak as at present developed is about ten feet in width. The ore taken out assays from $500 to $3,000 per ton.

On the 19th a strike was made in the lower level of the Midas which promises to be of importance....The Wheeler Co. are taking out bullion to the value of $10,000 per month....The Wilson produces about the same amount.

OPHIR.—The Ophir Company are timbering and preparing for the rush of water which they expect to have in cutting their front ledge.

NO ORE.—Owing to the shutting down of three of the leading mines in Gold Hill, by the disaster, a number of mills are idle.

EUREKA.—This company (on what was formerly known as the Norton ledge, Cedar Hill,) are taking out some very good ore. The vein is narrow, but contains much rich rock.

GOULD & CURRY.—They are sinking a sump, or well, at the bottom of the shaft, preparatory to opening a station and drifting, for the purpose of opening a new level.

Same of 24th: The Lady Bryan Company shut down night before last. They find the hauling of ore to their mill (the Golden Eagle) at Dayton, too great, therefore will move the mill to a site on the cañon, just below the mine, before resuming operations.

BULLION SHIPMENT FOR THE WEEK.—During the past week Wells, Fargo & Co. have shipped from their office in this city 5,783 pounds of silver bars, worth $135,517 41, and during the same time the Pacific Union Company have shipped from their office 2,539 pounds of bullion, worth $63,726 41; making the total of 8,322 pounds in bricks, valued, according to assay, at $199,245 85.

IMPERIAL EMPIRE.—25th: In each of the working compartments of this shaft has been placed a fine new steel wire cable, and the work of development at the lower levels has progressed in a very satisfactory manner.

DOLORES.—A choice piece of rock from this lead showed in silver per ton $442 23, and in gold $2,222 84, making the total yield per ton $2,665 07.

LATEST FROM THE BURNING MINES.—Same of 25th, The fire in the Gold Hill mines still continues. The draft is now toward the Yellow Jacket, up the shaft of which a strong volume of smoke and gases continues to arise. How much longer this obstinate fire will continue smouldering among the charred timbers and fallen debris it is impossible to say; strong hopes are entertained that it will be completely extinguished within the next 48 hours, but we fear that it will rage much longer.

[Our White Pine summary will be found in another column.]

WYOMING.

CARIBO HILL.—*Sweetwater Mines*, April 7th: Messrs Boyd and Tompkins have just discovered a ledge that prospects extraordinarily well; at a depth of 10 feet, the width of the ledge is five feet. We have several specimens of ore from this new discovery that exhibit free gold. If this continues at any depth with the same richness, a large mill can be kept in motion from it alone. * * Roberts' claim has a shaft down 70 feet, and the vein looks healthy. We have specimens from the dump, which are full of gold.

The Willow Creek Mining Company began to sluice yesterday, and will make a run of two or three days before cleaning up....A contract has been let, and work is progressing on the Norfolk ledge....An extension of the Nellie Morgan ledge has been found and 600 feet located....Work has been resumed on the "Atlantic Cable." Mr. Ramsey informs us that it prospects well. This is a very large ledge.

ROCK CREEK.—We visited this locality a few day since. We will mention a few of the ledges, with the progress made: "Gold Hunter" shaft, down fifty feet, and width of vein two feet; "Mary Ellen" shaft, 25 feet and vein 15 inches, in some places three feet; "Calhoun" shaft, 30 feet and vein 18 inches. These are small ledges, as far as size is concerned, but huge things when their richness is considered. "Golden Leaf" shaft, forty feet with a vein of 20 inches. Henry Marshall is constructing an arastra above town to crush rock from the Buck-eye State. Dr. Sperry showed us some quartz from a ledge just discovered—it prospects well. Sage Miller and party are making arrangements to construct a 5-stamp mill to be run by water power.

MINING REPORT.—Ten thousand copies of Adolph Sutro's work on "The Mineral Resources of the United States, and the importance and necessity of inaugurating a rational system of mining, etc," are to be printed by order of Congress. Mr. Sutro is doing a good service for the mining interest in collecting facts and statistics, bearing upon his great tunnel project. The liberality with which Congress is spreading these facts before the people, shows the high appreciation in which his labors are held by the representatives of the mining interest in that body.

COPPER, between the middle of March and the first of April, declined from 26¼c. to 22⅞c. This depreciation was due to the failure of the speculators to pay for copper, bought for delivery at the end of March. Low as is the present figure, a still farther decline is anticipated, from the fact that large quantities are yet held by speculators, as above, who must fail to meet their engagements. This decline, instead of the expected advance by reason of the increased copper tariff, has sadly disappointed some of the Lake Superior operators.

OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.
Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

San Francisco:
Saturday Morning, May 1, 1869.

Notices to Correspondents.

"T. C. M.," of Colorado, asks a series of questions which are answered as follows: Large stone arastras were used, to some extent, in the early days of California gold mining, before iron pans came into use.—An iron mining pan is simply an improved arastra.—The bed or bottom of an arastra is composed of numerous flat pieces of atone, laid in hydraulic cement. —Neither gold or quicksilver will pass through the bed of a well-built arastra. "The amount of power required to operate an arastra" depends upon the size and weight of the drag-stones, not upon the size of the arastra.—Arastras are generally constructed about five or six feet in diameter. An arastra of twenty feet diameter would be unnecessarily large; ten feet may be considered the outside limit of economy in size.—There was a patent taken out about a year ago by Mr. Seymour Hughes, of this city, for what might be called a "horizontal mill," in which the stamps were made to revolve in a sort of circular trough, the bottom of which consisted of a series of inclined planes. As the stamps revolved they were caused to pass up these inclined planes until they reached an elevation of about ten inches, when they fell upon a die, like stamps in ordinary use. This arrangement combined trituration with stamping. Although good reports reached us at the time, of its practical working, we have heard of only two mills having been constructed after this patent.—We do not know of any mill at present, which, "all things considered," is superior to the stamp mill for ordinary rock crushing.—We do not consider it economical to crush rock dry which "is intended for roasting, calcining or smelting." Dry crushing is slower than wet, and the cost of drying the pulp is less than the increased cost of dry over wet crushing.—There is less loss of gold in dry than in wet crushing, and when the pulp is to be subjected to a simple amalgamating process, in a pan or otherwise, it is thought by many that dry crushing is more economical than wet.—In dry crushing the rock must be fed into the battery dry.—Sodium amalgam is not in very general use on the Pacific Coast. It is employed, to a limited extent only, and mainly for amalgamating copper plates and for cleansing quicksilver. It is used by some, however, in ordinary amalgamation, to make the quicksilver more active.—Amalgamation with mercury is the only method of gold saving "in practical use" anywhere.—Whenever mercury is subjected to violent agitation, as in a quartz battery or pan, it *will* "flour." Sulphureted ores cause it to flour more than ores which do not contain sulphur.

CONTINENTAL Life Insurance Company, 203 Montgomery street, corner of Pine.

The Good Time Coming.

As the Pacific and Atlantic Railroad approaches completion, the tide of immigration to this coast appears to be setting in with a most extraordinary activity. Every mail from the East brings word of large preparations in all parts of the country for a wholesale stampede in this direction as soon as through travel is opened. The New York *Express*, in a late number, tells us that the exodus of farmers, mechanics and capitalists, this season, will exceed anything which has been seen since the days of '49 and '50. Thus it appears that this promises to be the most stirring of all the active years which the State has seen since the first advent of the gold-seekers. The inexhaustible resources of our agricultural productiveness, our unequalled mineral wealth, and the fame of our beautiful skies and delightful climate has reached the ears of countless thousands, not only in our less favored Eastern States, but throughout all Western Europe as well, from all of which regions the masses are taking up their line of march toward the rising empire of the West.

The completion of the great continental railroad appears to have been accepted as conclusive evidence of the reality of our high claims upon the attention of the labor and capital of the world. No farther questions are now asked; but all who desire to better their condition, and have the means of doing so, to the extent of a removal to these shores, are making preparations to come.

It is impossible for the coldest mind to contemplate, without a glow of exultation, the rapid growth which present signs, unmistakeably indicate, as being in early store for our adopted State. We can now look with the utmost confidence to the speedy filling up of our magnificent interior and coast-side valleys, to the establishment in our midst of large and flourishing manufactories in every department of industrial enterprise, and to a greatly increased impetus to mining operations throughout the entire western slope of the Rocky Mountains. The "howling wilderness" that until now, has stretched in almost unbroken continuity from the Missouri to the Sierras, will soon be dotted with towns and cities, that will ere long vie in enterprise, luxury and elegance, with the oldest centers of human industry in Eastern lands.

The sudden and unusual activity in railroad building, which is manifested everywhere throughout the "western slope," is an evidence that capital has become convinced that these are no vain imaginings; but that the most improved facilities for intercommunication are imperatively called for in advance of the arrival of the coming multitudes, the vanguard of which has already reached our shores.

The rich agricultural lands of the San Joaquin, upon both their eastern and western border, will soon be brought within a few hours' distance of San Francisco—miles are annihilated; time and cost are the only elements of distance now taken into account, in the creation of lauded values. In this valley, alone, are at least ten unoccupied million acres of the finest agricultural lands in the world, where all the cerals can be produced in the greatest abundance, and where the nuts and fruits of semi tropical climates may flourish in their highest perfection. Below that region, in the adjoining county of Los Angeles, the silkworm spins a more lustrous web, and longer and heavier than anywhere else in the world; and golden skies and pure, fresh air produce grapes and wines nowhere excelled, either in quantity or quality; while upon every side the choicest breeds of sheep and goats may find abundant pasture for the yield of the softest and most costly fabrics, with which to employ the busy fingers of the thousands of factory operatives who are beginning to swarm in the great manufacturing and commercial metropolis which is enveloping, in its extended embrace, the bays and headlands of the finest harbor in the world. The agricultural resources of our northern and Coast Range valleys are scarcely less notable than those of the San Joaquin.

Let the toiling and famishing thousands of the East come on. There is room enough and to spare, and work for them all—all who are willing to brave the perils of ocean or dust of continents, to make for themselves, on this western coast, a home which they will take pleasure and pride in bestowing as a rich legacy upon their children. The inducements held out are in nowise exaggerated, but will increase in importance and extent with the introduction of capital and the growth of population.

Railroad Progress.

The present is a season of unusual activity and enterprise in railroad construction in this State. We have now 466 miles of railroad in actual operation, within the limits of the State, only 138 of which are set down to the overland road. It is safe to predict that not less than 250 miles will be added to this aggregate during the present summer. We note progress in this direction as follows:

The special event just now occupying public attention is the expected junction of the Central Pacific and Union tracks, at Salt Lake. The place of junction was noted in our last issue; the time will be somewhere from the 5th to the 10th of May. There is some pretty heavy work to be done just at the completion, which is causing delay. There has been a very commendable spirit of rivalry recently developed between the two companies as to which could do the greatest day's work at track-laying. The Union Company first showed its hand and laid—some three or four weeks since—*seven* miles in one day. The Central Company postponed its great day's work until Wednesday last, and succeded on that day in laying a few feet over *ten* miles! This great feat was accomplished by the skillful maneuvering of an army of 8,500 men, and 800 horses, with all the locomotives (six in number) and car assistance which could be brought to bear on a single track, with turnouts. The work was done within ten hours' time. The grading, of course, was all previously prepared; but with the exception of the three miles which was hauled out by teams, and laid along the track, the day before, all the iron, ties, and fasteuings of every description was delivered to the work as wanted, on the day on which the track was laid. No army in battle array was ever more skillfully handled—and few have ever accomplished a more beneficial work.

The precise point of the terminal grounds of the Western and Southern roads in this city, have not yet been fully determined; but they will be somewhere in the Mission Bay. The Western Road will no doubt reach the city by a track crossing the Bay just north of Long's Landing, and thence, skirting along upon its western shore, come into the city by a cut through the Potrero Hill and near by and parallel to the South San Francisco Railroad. The Southern Road will come in over the San José track. Work upon the Western Pacific is still being pushed with commendable speed. This road will have one of its termini at Oakland Point. The engineers have been running a survey for their line through Oakland the past week.

Work on the South San Francisco Road is still being pushed at their deep cut on the Potrero; The grade there is being lowered ten feet, and work continued night and day.

The road from San Rafael to San Quentin is to be pushed forward to an early completion. The stock has nearly all been taken. A telegraphic order for the iron and rolling-stock was sent East on Monday of last week.

The great Yuba City Railroad bridge has been completed. This structure, spanning the river and overflowed land, is a mile and a quarter long. The track was laid upon the bridge last week.

The citizens of Woodland, in Yolo County, are rejoicing in the prospect of the arrival of the iron horse in that town some time in May.

The piles for the terminal depot of the California Pacific at South Vallejo, will be driven about the middle of May.

VIRGINIA AND TRUCKEE.—Although the original name of this corporation is retained, there is no present intention of making any connection with the Truckee. The Carson river is the immediate objective point; as such a connection is deemed of more pressing and important necessity, as it will cost less to secure wood and timber from that direction than the other, and more economical results can be obtained in the economy of the transportation and working of ore from the Comstock mine. About 500 men are now at work upon this road between Virginia and Carson; they are divided into seven gangs, three of which are engaged upon tunnels—one at American Flat and two at Gold Hill. An extension of this road along the base of the high land to the Central Pacific, near the mouth of the Truckee, will be only a matter of time.

Manufacturing Notes.

THE CHILE EXHIBITION BUILDING was, at the time of the departure from Valparaiso of the last coast steamer—March 15th—approaching completion, under the able direction of the contractor, Mr. Robinson, and as regards both the location and style of construction, it was pronounced admirably calculated to fulfill the purpose for which it was designed. The total space comprised within the building is said to be 16,675 square metres, of which 4,700 metres is under cover. Both England and France will be well represented, and the space provided for exhibitors will be fully occupied. Californian merchants and manufacturers are always too apt to be engrossed in local or epidemic excitements, somewhat on the principle of a mining stampede, which are in danger of educating our entire community into a disregard of the grand agricultural and commercial principle that in order to reap, we must first sow.

THE SHOEMAKER'S STRIKE in this city was sustained by about 500 men of that trade, who were accordingly, for the time being, out of employment. Six firms suspended work and have been seriously considering the practicability of employing Chinamen, some of whom are already engaged in the trade on their own account. The names of the associated firms are Kowalsky & Bros.; G. K. Porter; Buckingham & Hecht; Hobart & Co.; Marks, Calisher & Co., and the Pacific Tannery Boot and Shoe Company. The rates at which the workmen had been paid would enable them to make from $20 to $28 per week. They ask an advance of from 16 to 18 per cent.

EMPIRE SODA WORKS AT VALLEJO.—The editor of the *Recorder*, having visited the works of Mr. E. Gettigan says: "We were agreeably surprised to find his works so extensive and his machinery so perfect in all its parts." The very numerous natural soda water springs around the bay of San Francisco and elsewhere in California, possess large quantities of the sparkling carbonic acid which constitutes its characteristic and most valuable ingredient, but not sufficient to tickle the palate to the commercial standard; so that additional quantities have to be generated and bottled up in the water artificially.

EFFORTS TOWARD SILK MANUFACTURE.—Mr. Joseph Newman, of San José, has been traveling through the southern counties of California for the purpose of buying all the silk cocoons he could find fit for winding or spinning. The only place where he met with a lot of any importance, was in Santa Barbara, and he bought from A. Packard and J. E. Goux, their crops of 1867-8, amounting to three hundred thousand cocoons, which were shipped on the steamer Orizaba, Friday, April 16th. Subsequently Mr. Newman lectured to the people of Los Angeles on the subject of silk manufacture, pointing out the methods by which growers and manufacturers can be mutually and individually most benefited in the pursuit of this promising specialty of California's staple products.

The "Cal. Tar and Turpentine Manufacturing Co." have issued a prospectus, and divided their interests into 500 shares, which are sold at $50 each; the principal feature in the business being that they propose to manufacture, under a new and improved method—lately obtained from Swedea, where the system has been in successful operation for about two years, having the advantage of saving all side products—tar, turpentine and resin, together with their concomitant substances, pitch, charcoal, potash and wood acids, etc., etc., etc., for which the dease pine forests of our northern coast are so well adapted; and that they can successfully compete with all at present supplying the Hawaiian, China, Australian and Western South American markets. The Trustees are James Patterson, Peter Miller, Cole Deane, James Wilson, Ellis W. Moss.

Planing Mill, etc., at Oakland.—Burnham & Standeford's new planing mill, at the corner of Washington and First streets, Oakland—a large two story frame, with rustic exterior finishing and corrugated iron roof—was opened for orders about the first of last month, and contains all the ordinary ripping, sawing, planing, mortising and moulding machines of establishments of the kind. Smith's (of Smithville, N. J.) mortising inventions, and Rogers' sash and circular moulding machine may be seen in operation.

Machinery for the Cotton Mills.—The screw steamer Commodore has conveyed to San Antonio the remainder of the machinery for the Oakland Cotton Mills. It will be remembered that a short time since a vessel was wrecked with this machinery on board. All has been recovered. *Alameda Democrat, April 24th.*

Immense Manufacturing Capital.—The *Bulletin* a few days since mentioned a report that the Mission and the Pacific Woolen Mills had been purchased by a newly formed company with a capital of $5,000,000. It is said that the new company will not only greatly increase the amount, but also the (already very great) variety, of goods manufactured.

Wood Working Establishment at Vallejo.—The *Recorder* says: We are pleased to be able to announce that a gentleman of liberal means has made arrangements for the erection of a planing mill and sash factory, near the foot of Sonoma street, and that the mill will soon be put up.

Saw Mills at Santa Cruz.—The *Sentinel* says: W. W. Waddell's saw mill, twenty-five miles up the coast, is turning out an average of 17,000 feet of lumber per day. Last Monday George Anthony's mill sawed 2,000 feet. Farmer's mill-yard is full of lumber waiting for transportation, as is Ashley's. We have not learned of the quantity at Hicks', but suppose it is well supplied. Wadden's mill is not in operation

Oakland in a Manufacturing Light. The *Transcript* says: That Oakland is to be a large manufacturing city is the growing belief. Her facilities are superior to those of almost any locality in the State. Railroads will be built in a few years, connecting Oakland with the coal mines of Mount Diablo, from whence her supply of fuel must come. Quarries of building stone at the foot-hills will supply foundations for the manufactories which will find appropriate location in the long line of property from San Antonio creek to the Point, which is in the immediate vicinity of the water.

New Strikes in the Lead Region.—A fresh impulse has been given to lead mining in Iowa by a new strike, rivaling in richness the "Diving Bell." and "Old Tom Levins'" mines of the past. The sheet of mineral in the cap is described as being two feet thick, and the mineral showing over in all directions in black mud.

The Gold Hill Mines.—The latest report from the mines at Gold Hill report the fires as effectually extinguished. The shafts are open; but owing to the presence of large quantities of gases little can yet be done in the way of further exploration, either to recover the bodies still in the mines, or to ascertain the nature and extent of the damage done. The shaft in the Gould and Curry mine is now down 1,165 feet the deepest of any in the State.

Mineralogical and Geological Notices.

Mineral Characteristics of Durango, Mexico.—We find numerous interesting features in connection with the tin and silver mining district of Durango district, Mexico—lying 150 miles in the rear of Mazatlan. It has its Iron Mountain, a "tremendous mountain," 10,000 feet high, which, like the famous ones of Missouri, and of the Bothnian Gulf in Sweden, is "all iron." Some specimens from a batch on our table, brought to us by Mr. J. H. C. Bennett, an experienced miner, who has seen and studied that country intelligently, consist of red hematite, and specular iron beautifully crystallized as micaceous iron, the black surface of the crystals being sometimes curiously covered with a powdery brown oxide of tin. In parts, the oxides of iron and tin are so intermingled in the same specimen,—found near the iron mountain—that the crystals of micaceous iron seem to consist, at the base, of laminated wood tin. The iron mountain is described to us as a chimney of iron. An English company has iron furnaces, including a reverberatory puddling furnace and a rolling mill, at work there, which are supported by local demands for iron work, chiefly from the mines; but the ores are too infusible for making good castings, without first mixing Scotch pig; the smelters having at any rate had poor luck in casting in any other manner than with such costly mixture. Durango is 7,200 feet above the sea. A railroad is to be built. Freights to Mazatlan are three cents per pound.

The mineral district is in a whitish, highly silicious and argillaceous sandstone, (from denuded porphyries?) nearly as deposited, constituting the entire elevated country, underlaid by paleozoic slates contorted and often tilted nearly vertical, which crop out both on the western and eastern slope of the Sierra Madre. Tin occurs in veins and flat deposits of a very peculiar character, and in quantities believed to be as rich as anything of the kind yet discovered.

Three specimens are worthy of notice: 1. A crystallized radiated mass, consisting of specular iron enclosed by oxide of tin. 2. Oxide of tin so nearly resembling grape-clustered calcedony, as to be distinguishable only by its weight. 3. Arsenical tin ore, apparently a mechanical mixture of SnO^2 and AsO^3, the tin being in dark brown grape clusters, and the arsenious acid mixed with alumina, in dirty yellowish incrustations. The smelted tin for the market contains from 5 to 8 per cent. of arsenic.

It seems probable that silica, tin, arsenic, iron, etc., were deposited interchangeably from alkaline solutions, holding them in the form of silicate of soda, stannates, arseniates, etc., the precipitating cause in the case of silicate of soda being mere exposure to the air, and cooling off, as is frequently observable at hot springs.

Caves in the Eastern Nevada Limestone.—Many of these are reported, from different districts. One discovered by J. C. Carson, 2½ miles north of Hamilton, was six feet wide at the mouth, and was found, upon clearing the aperture of the loose rocks, dirt, etc., to extend to a depth of twenty-five feet, presenting a room twenty-five by forty feet, with openings leading from it to an unknown distance. The miners on the Enos' deposit ledge, Superior Company, in sinking a shaft on the "vein," at the depth of twelve feet struck into a cavity in the rock, which stands like a natural shaft, extending from within three feet of the surface to an unknown depth. The cave, or natural shaft, is from three to six feet in diameter, and is lined with curiously formed stalactites.

From Patterson District another cave is reported, situated five miles west of the town of Montezuma, which is quite large; having chambers, passages, stalactites, etc., that are compared with the great mammoth cave in Kentucky; Mr. Murphy, the explorer, estimating that there are at least 700 different passages and chambers running underneath the entire White Mountain range.

The philosophy of caves in limestone is simple. Burnt lime—or lime minus the carbonic acid, which makes it limestone—becomes soluble in water. Mountains may thus run off in transparent brooks; but the moment that free carbonic acid is encountered, that earthy substance becomes again insoluble, forming carbonate of lime; usually precipitating itself around springs, where the water comes in contact with air and absorbs carbonic acid from the latter. Not only heat and acid gases from volcanic causes will set free carbonic acid, but the decomposition of sulphurets will do it, forming, by the oxidizing or rusting influence of the atmosphere, sulphuric acid; this liberates the carbonic acid, and with lime forms gypsum, which is also soluble in water in certain proportions. Sulphates of the metals are likewise soluble; so are their chlorides, excepting chloride of silver. The latter metal dissolved as sulphate, assumes palpability—as every prospector knows—the moment that chlorine from salt comes in contact with it. Gypsum is found in immense deposits, and under all imaginable circumstances, where water has had the opportunity to take it up and carry it. The same sulphuric acid that can change carbonate of lime into gypsum, and re-locate it in nature's laboratory underground, is at liberty to operate on the metals wherever they may happen to come in its way.

Native Copper and Silver Side by Side. A specimen of this kind, characteristic of Lake Superior, shown to us by Mr. Bennett, affords strong enough evidence that fusion had nothing to do with their origin, since they would have been melted together into an alloy.

Baron Ritchofen, who has lately been on a geological tour up the Yangtze, as well as in the neighborhood of Shanghai, started a few days since for Chefoo, via the Grand Canal. He will examine the mineral regions of Shangtung, *en route*. From Chefoo, he proposes to cross the Gulf, and to make his way to the Amoor, down that river to Pasiette, and thence to Newchwang, via Kirin.—*Shanghai News Letter, March 20th.*

Marble of a dark variegated color, and susceptible of a fine polish, has been found by Mr. Isoard, eight miles above Nevada City.

The second volume on Paleontology of the California State Geological Reports, has just been received by Mr. Payot, No. 640 Washington street.

Returned.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

Crucibles.

The Patent Plumbago Crucible Co.,

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCISLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

Important to Assayers and Brass Founders.

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. S. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by me and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENSERO & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Frueberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Chimney Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

Systems and Practice of Irrigation.

The usual semi-monthly meeting of the New York Society of Practical Engineering took place on Tuesday evening, March 30th, the regular subject for the evening being the "Past, Present and Future of Irrigation," and a paper on that topic was read by the President, J. A. Whitney.

The paper gave an elaborate view of the history, the different systems, and the present state of irrigation. The latter comprehended not only the condition of the art in Asiatic and European countries, but also its condition in the western part of our own country. The different systems of irrigation were denominated by the author—flooding, flowing, subterraneous irrigation, and irrigation by means of Artesian wells, the latter class being placed by itself on account of the peculiar manner in which the water is obtained. The great feature of the paper, however, was the discussion relating to the state and future possibilities of irrigation in the Territories of the West, and in California. "Long ago," said the speaker, "when California was but a province of Mexico, and the fame of her wealth was unknown to men, the Spanish settlers in the dry southern sections cut dry sluices to convey the mountain streams to the low places to form ponds, from which the water was conducted to other portions of the fields, and by this means raised luxuriant crops on the rich alluvial; but although the State is well situated for a system of irrigation that should save the crops in unusually dry seasons and assist them in all, it is not practiced to any extent, except on the plains of Los Angelos, and in Yolo County, in which latter one hundred thousand acres of rich land have been irrigated. There can be no doubt but the time is rapidly approaching when irrigation must constitute the one great phase of Engineering as applied to California." Recalling the remarks of a recent writer, the speaker mentioned the vast expanse of steppe land lying east of the great valleys, and rising in plateaus toward the steeper hills of the mining districts. These plains on which drought parches everything, could be supplied with flowing water by a proper system. The speaker also referred to the advantages possessed by California in point of position. The Nevadas, running nearly the whole length of the State, are able to furnish a continual supply of water, while great lakes of supply lie on the high ranges. Sufficient water to inundate all the present land cultivated is now drawn from these mountain sources for hydraulic mining purposes. Artesian water seems to be plentiful, and boring down 150 feet is not as expensive an operation here as in other countries.

The writer then passed to the subject of irrigation in the Great Basin, "whose agricultural capabilities, when the fields are properly supplied with water, are as little generally understood as the mineral wealth of the mountain regions is definitely known." "Of Colorado, it is said that it is a land of sunshine, yielding but little, though scarcely a desert, and possessing millions of acres that would be reclaimed by a canal leading from the Colorado to the rich but arid districts. So of Nevada; for in many of the valleys the soil is rich, though streams are scant, and by careful and proper use of what water is available, it is said with apparent good reason that many millions of acres could be reclaimed from their waste condition. In Idaho, the soil consisting mainly of decomposed granite, yields its crops obedient to the simple watering that the scattered settlers have applied to the fields by artificial means. In Arizona, where remains of waterways show that the ground was once tilled with care, there is an estimated area of a million of acres, capable of reclamation by irrigation. In this Territory an irrigating canal is in process of construction under the sanction of the Government, the first of the great works that must eventually exist along the Colorado River. What is said of Arizona, is applicable, though in a less degree, to New Mexico. In the valley of the great Salt Lake, a large population live upon the agriculture that is sustained by irrigation. The water is mainly supplied from the mountain rills. Canals have been made to conduct the water even to the fields and gardens of Salt Lake City." The Mormons

now contemplate making a grand canal from Utah Lake, thirty miles away, so that they may carry on a broader system of irrigation than now. There are, however, other portions which might be made fertile by an irrigating system.

The reading of the paper of which we have given extracts relating to its practical bearing, was followed by a discussion engaged in by Dr. Hall, and others.

Written for the Mining and Scientific Press

What Makes Ultra-Marine Blue?

MESSRS. EDITORS:—In your issue of April 17th, you give a sketch of the above beautiful blue pigment. Having myself manufactured thousands of pounds, I will offer a few remarks about this interesting compound. As you observed, it was not until a little more than thirty years ago, that people commenced to produce it by artificial means. Before that time they were only limited to the small amount found in nature, and consequently its value exceeded that of gold. The reason was that analytical chemists could not determine what the stuff actually consisted of, that produced the blue color, and to this day I do not believe this point to be definitely settled. Dr. Elsner is firm in his opinion that some combination of *iron* produces this effect, as he could not make the color without the presence of iron; other chemists declare that some *oxide of sulphur* causes the blue color. My opinion does not agree with Dr. Elsner's, since some specimens of the natural and of the artificial ultra-marine do not contain iron. It is true that iron can be converted into a blue oxide in the humid and dry way; but this does not seem to be the real agent in this case. The second opinion seems to be nearer the truth, since all kinds of ultra-marine contain some *sulphur*, if it be ever so little, and likewise sulphuric acid in some connection. If sulphur is mixed with anhydrous sulphuric acid in certain proportions, it produces a green substance or a beautiful blue liquid. Both of them are very indurable, since, if water be added, the color immediately disappears, leaving nothing but sulphur and an acid solution. Another proof of the sulphur possessing a blue oxide, is furnished by the blue flame of burning sulphur. Now my opinion is, that the alumina, which is known to have a great affinity for pigments, forms a connection with that blue oxide of sulphur, and renders it stationary, so that the presence of water would no more destroy it. It is certainly a wonderful production, as no metallic oxide is there, to produce the color. EDWARD PIQUE.

CALIFORNIA
Marine Metallic Paint.

This Composition, the result of scientific and chemical research, after having been thoroughly tested for the past twelve months, is now offered for sale by the "California Marine Paint Co" incorporated March 25, 1869. The experiments to which it has been submitted, have proved that it is one of the most valuable discoveries of this wonderful age of invention. It has been extensively used in painting the bottoms of all kinds of sailing vessels, wood, iron and copper, and with invariable success. Wooden bottoms, piles, etc., are thoroughly protected from the destruction of the *teredo navalis*, or sea worm; and iron vessels effectually preserved from the adhesion of barnacles, grass and all descriptions of zoophytes, no injury whatever resulting to the plates, as frequently occurs from the use of copper, and other pernicious paints; but, on the contrary, its known properties will preserve them.

By the use of this Paint, coppering vessels is rendered unnecessary; but where a vessel has been coppered it will not only keep it from fouling, but preserve the copper from the ordinary wear and tear, amounting to 10 per cent. per annum, and render it almost indestructible.

It is also invaluable for the preservation of all wooden structures, especially railroad timbers, bridges, floor beams in houses, telegraph posts, and is a certain preventive against the action of the white ant and comagen of Mexico, China, and India.

The company are now prepared to supply all orders, and enter into contracts for the application of this Paint.

Orders and communications in regard to terms, addressed to Capt. R. H. Waterman, President; James Pollock, Superintendent Dry Dock; or L. L. Bullock, Tide Land Commissioner, will receive prompt attention.

R. H. WATERMAN, President of Company.
LLOYD TEVIS, JAMES POLLOCK, L. L. BULLOCK, SCOTT TIDBALL, THOS. A. TALBERT, } Trustees.

A GOOD INVESTMENT.
THE MOUNT MORIAH
Silver Mining Company,
OF ARGYLE MOUNTAIN,
White Pine District,
NEVADA.
Capital. - - - $300,000.
6,000 Shares, $50 Each.
FULL PAID AND NOT LIABLE TO ASSESSMENT.

President.....A. DE LAND
Secretary.....LOUIS COHN
Superintendent at Mines.....CHAS. E. HARRIS

TRUSTEES:
A DE LAND, CARL PRECHT, THOMAS ANSBRO, LOUIS COHN, W. S TAYLOR.

This Company offer to the public One Thousand Shares of the Capital Stock for a Working Capital, at the subscription price of Five Dollars per share—FULL PAID, and NEVER liable to any assessment whatever. The mine is admirably located for working, being situate on Argyle Hill, opposite Treasure City. Shaft sunk 10 feet, showing a large body of chloride, which assays $700 per ton, and which will now mill $200. The capital raised to be used and expended on the mine. The standing and reputation of the Trustees is ample guaranty of responsibility, etc. Maps and samples of ore, and subscriptions at the office of the Company, Rooms No. 15 Stevenson House, corner California and Montgomery, and at 211 and 213 California street, near Battery street. 15v18tf

ILLINOIS
SILVER MINING COMPANY
White Pine District.
Trustees:
JAS. H. CUTTER, E. U. SHAW, B. H. FREEMAN, JAS. R. CARNISS, DAVID BUSH.

The Company's Mine adjoins the celebrated "Silver Glance," and is in close proximity to the "Argyle," and other prominent mines of the District.

From developments already made, the Trustees feel justified in saying to their friends that this is one of the best opportunities ever offered for investment in this State.

For the purpose of further developing the mine, the Company has set aside a limited amount of stock, to be sold as a working capital, of which they now offer 1000 shares, at the nominal price of $2 50 per share, unassessable—the entire proceeds of which will be devoted to developing the mine.

The books of the Company are now open for subscription at the office of the Company, No. 432 Montgomery street, Room No. 1, first floor. By order.

JAS. H. CUTTER, President.
C. W. STEWART, Secretary.

Engineering.

WATER SUPPLY FROM CLEAR LAKE.—The Solano *Advertiser* says there is a project on foot to supply that city with water from Clear Lake, through an aqueduct of forty million gallons' capacity per day. "The completion of this aqueduct," says that cotemporary, "is no longer doubtful," —the distance being seventy-five miles.

It appears that not only Vallejo, but San Francisco also, is had in view, as a water market. In that light the project becomes more reasonable, and financially interesting. The future water supply of San Francisco has been a somewhat puzzling question for engineers. South of the Spring Valley Company's present sources in San Mateo County, the distances are too great, the creeks outside alone being worthy of consideration, and they too small. Mount Diablo and Tamalpais afford considerable streamlets on their northern sides, but neither the fall nor the quantity is as great as is desirable. Clear Lake lies 100 miles north of San Francisco, and 1,500 feet above the sea. At its lowest stage, in September, it will easily overflow more than the 40,000,000 gallons provided for. Under "New Incorporations" will be found another San Francisco water enterprise.

WATER SUPPLY IN THE INTERIOR.—That branch of engineering undertakings having in view the supplying of water to towns, cities, or districts, is of far greater importance in the periodically rainless regions west of the Rocky Mountains, than in the balmy forest covered States beyond, where brooks are never failing. At White Pine large capital is being invested in works to supply Hamilton and Treasure City, by several companies that have been heretofore mentioned. The *News* reports that the Silver Springs Water Co. have commenced on their works, intended to supply Treasure City, and expect to have them completed in June. The water will be brought from several springs in the eastern slope of the main White Pine Mountain, about three miles west of this city, and conducted across the cañon to the neighborhood of the California mine. At this point an engine of sufficient power will be placed to force the water to the top of Treasure Hill.

The Idaho *World*, of April 15th, reports a project by Messrs. Charles Ostner of Payette Valley, and L. O. Benedict of Centerville, to bring the water of the Payette, from a point near Ostner's bridge, into Boise Basin, across a low divide, to supply the mines of Placerville, Granite Creek, Centerville, Pioneer City, and the adjacent districts. The plan proposed is to force the water by five stationary engines, from the river, into as many ditches in tiers, to the summit of the mountains between Payette Valley and Boise Valley, and thence to lead it by ditches to the respective mentioned camps. The projectors estimate the total volume which can be thus forced to the summit at fully 10,000 inches, and the total cost of engines, fluming and ditching at $300,000.

RAILROAD CONSTRUCTION.—From the railroad front we are informed that on Monday, the 19th, five miles of track were laid on the Central Pacific; and the Humboldt *Register*, April 6th, states that on Tuesday, March 30th, *ten* miles were laid. Concerning the correctness of this report the Sacramento *Reporter* says: "We do not doubt it, as the Superintendent of Construction stated several weeks since, that he intended to lay that much in a day before the connection was made. The telegraph and the San Francisco papers of Thursday state that on Wednesday, April 28th, ten mile were actually laid, and a few thousand feet to boot.

By a late telegram from Washington to the *Herald*, we learn that the President has appointed a Commission to examine the construction of the Pacific Railroad, composed of civil engineers entirely. Their names were not to be announced until it is known that they will accept.

PUBLIC SURVEYS.—The government printing office has issued Gen. Wm. J. Palmer's "Report of Surveys across the Continent in 1867-8, on the 35th and 32d parallels, for a route extending the Kansas Pacific Railway to the Pacific Ocean at San Francisco and San Diego." The work contains 250 pp., with maps.

It seems to be generally understood that Sherman Day's brief incumbency in the U. S. Surveyor General's office, in San Francisco, is to be terminated by a new appointment. The Sacramento *Bee* reports that J. E. P. Weeks, for a long time News Editor of the Sacramento *Union*, will probably be appointed; but Mr. Weeks publishes a card, in which he states that if his appointment as Surveyor has been agreed upon, it is a surprise to him. That gentleman has more strong friends who would be glad to serve him than any other man that could be named for the position, but his card indicates that he will refuse to accept anything more than the compliment.

The Secretary of the Interior seems to have determined that he has no power to order further surveys of the public lands within the limits of the Pacific Railroad grant, until such time as the Company, or other parties interested, have deposited in the Treasury of the United States an amount of money sufficient to pay for surveying and conveying said lands. The Auburn *Herald* supposes this is the reason why the Surveyor General refused to order the land surveyed upon which Auburn is located, until money had been deposited to cover the cost; and reports that the Deputy U. S. Surveyor from Grass Valley, Mr. J. G. Mather, will in a few days commence the survey of Township 15 North, Range 8 East, and 14 North, Range 8 East, Mount Diablo base and meridian, lying on the line of the railroad between Clipper Gap and Colfax. Township 15 North, Range 8 East, contains Allison Ranch, North Star, and several other valuable mines. The settlers are anxious to pay for their titles.

Resources and Developments.

JAPANESE CHESNUTS.—Those of our readers who examined, and better still, those who had the pleasure of testing the mammoth, yet delicious Japanese chestnuts, which were exhibited at the State Agricultural Fair, two years ago, will be pleased to learn that Mr. H. D. Dunn, of this city, recently received three thousand young trees of this variety for growth in this State. The trees arrived in excellent order, and were sent to Bugbey's vineyard, above Folsom, where they will be properly cared for preparatory to sale and distribution. There can be no question as to the successful cultivation of this tree in California. Its extensive introduction here will be a valuable addition to the agricultural resources of the State. We shall endeavor, under the agricultural head in our next issue, to give some hints with regard to the cultivation of nut fruit trees in California.

FARM HOMESTEADS.—The principle of Homestead Associations seems to have taken a new and most useful turn, in its application to large tracts of agricultural lands. One of these associations was recently started on a tract of land just across the American River from Sacramento, embracing some 5,000 acres. It was put up in shares of forty acres each, at $500, payable in installments of $10 per month, without interest. The entire tract was taken up in a few days after the proposition was placed before the public. All the shares offered in this city were taken in a single day. It is to be hoped that this plan of procuring small farms will be quite generally adopted. Owners of large tracts will receive better profits, while thousands of persons who cannot pay down for a farm, will be able to secure the same by small monthly payments. Land put up in forty-acre sections might be secured in tracts of 80 or 120 acres, or more, by subscribing for one or more sections, as might be desired. In bidding for choice, there would be no difficulty in securing adjoining sections. It is to be hoped that the success of this enterprise will lead to the formation of other organizations of a similar class.

ICE.—A new ice company has been formed in this city for bringing ice from Kodiac. Our annual consumption of this article is about 4,000 tons, which is sold here to consumers at five cents per pound. A reduction in price will no doubt follow the establishment of a new company, and, as a consequence, a greatly increased amount of consumption.

THE RECENT EXPERIMENTS WITH THE TELEGRAPH.—In our item last week under the above head, the last word should have been *second*, not *minute*. On page 152 of the current volume, our readers will find the subject more fully noticed.

New Mining Advertisements.

Cordillera Gold and Silver Mining Company.—Morelos District, Chihuahua, Mexico.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the sixteenth day of March, 1869, the several amounts set opposite the names of the respective shareholders as follows:

And in accordance with law, and an order of the Board of Trustees, made on the sixteenth day of March, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., auctioneers, No. 426 Montgomery street, San Francisco, on Monday, the twenty-fourth day of May, 1869, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. M BUFFINGTON, Secretary.
Office, 37 New Merchants' Exchange, California street, San Francisco. ap24

The Annual Meeting of Stockholders of the Williamantic Silver Mining Company, will be held on TUESDAY EVENING, May 18th, at 7½ o'clock, at the office of the Company, No. 418 California street

ap17-4w C. A. UHRIG, Secretary.

'THE MINING AND SCIENTIFIC PRESS has entered upon its XVIIth Volume. It has donned a new-style hat; or, in newspaper parlance, a new heading, which gives it the solid, scientific look it merits. Other improvements typographical are also noticeable. No call for improvement in its matter.—*Amador Ledger, July 16th.*

New Inventions.

A Novel Assaying Apparatus.—Mr. J. S. Philips, mining engineer and assayer, at 423 Washington street, in thie city, has invented a novel apparatus, founded on the principle of the blow-pipe assay, by wbich be is able to operate on 15½ grains at ono timo. By this apparatus, which is contained in a cubical box of only six inches face, he effects a concentration of three blow pipo flames npon his assay so as to readily reduce the largo amount stated, and effect the cupellation of the same moro easily than it could ho done hy an assay furnace. When his work is completed the value, per ton, of the latter may be read off at sight, by an ingeniously devised instrument carried within the aforesaid box, which also contains all the chemicals required for 50 or 60 assays. This apparatus is designed for the use of prospectors, and can be readily carried under the arm, or slnng over the back liko a canteen. Measures aro heing taken for securing a patent for the eame through the Patent Agency connected with tbis office.

Sweet's Improved Sulky Plow.—This improved implement for the farm, which is a recent Oregon invention, may be seen on the sidewalk in front of Hawley & Co'e storo, corner of California and Battery streets. The chief improvements in this plow consists in a device by which either plow can be elevated or lowered while in motion, hy the driver as he sits npon his seat, thus readily and instantly adjusting it to uneven ground. It may also he instantly changed from a stiff to a limber tongue, while by the mere application of the foot to a brake, or hoth plowe may be readily raised out of the ground to pass over any obstruction. This plow was first introdnced in Oregon last summer, where it is said to ho giving the best of satisfaction. It is now offered in this State in county rights, or the entire State right will be disposed of. The inventor, Mr. L. T. Sweet, has also patented an ingenious device—a single-tree elip, by which a runaway horse can be instantly detached from a carriage by eimply pulling elightly upon a strap, running along and attached to the front of the dasbboard. We sball probably hereafter have occasion to speak of other ingenious inventions by Mr. S., applications for patents for which are uow pending.

Martin's Miniature Hydraulic Engine. One of these machines may be seen in operation at the Howe Sewing Machine Co'e office on Kearny street. By our Stockton exchanges we learn that Mr. Vincent, of that place, also has one in operation in many a eewing machine, it being alleged that three times the labor can be done by a eewing machine driven by one of these engines, than can be performed by one worked in the ordinary way. The oscillating cylinder ie an inch and a half in diameter, and the piston stroke three inches and a half. The hydraulic pressure is applied by conducting the water from the faucet of an inch pipe through a small gutta-percha hose eecurely fastened to the center of the cylinder on one side, and the moment the spigot is turned and the cylinder moved from a level eo as to admit the force of the water into the eavity, tbe see-sawing movement commences, and the engine soon reaches a speed of two hundred and fifty revolutions per minute.

Knee Pressure Sewing Machine Power. The Oakland *Transcript* says: The Quidnuce, a company of young gentlemen of Folsom, have invented and filed a eaveat for a patent of a new machine, tbe object of which ie to save the use of the foot in running small machines, especially the sewing macbine. It is to be fastened to the legs of tue sewing machine, and by a gentle presseure of the knee sideways, the sewing machine is made to run with ease, the speed being regulated by the strength of tbe pressure. The pressure removed, the machine stops. It is a small affair in size, takiug very little space, and easily fastened inside or outside the legs of the sewing machine. Machinists who have seen it are confident if will work to a charm and ie eusceptible of a wide application.

New Hay Press.—The Santa Cruz *Times* eays: Mr. George Nutter bas invented a new hay-press—a most decided improvement upon the old-fashioned sort. It bas greater power with less expenditure of labor, and turns out a neater bale.

Progress of Invention.—Who would have believed two centuries ago that a "little vapor"—the symbol of the feebleness and the brevity of human Life—would prove to be a giant, the motive power for the immenso industries of the world—multiplying manufactures a million fold? * * * Enough has been discovered to demonstrate that light and heat can be husbanded from the sun's rays, and it is very generally believed among ecientific men that within a few years every one will be enabled to set bis retort on the window-sill on a sunshiny day and gather in a few hours fuel and flame sufficient to supply an ordinary household for a week.—*S. F. Herald.*

New Patents Issued to Pacific Coast Inventors.

For the Week Ending April 15th.

Magazine Fire-Arm. — Thomas Cullen, San Francisco, Cal.—88,853.

I claim 1. The revolving magazine B, in combination with the outer cylinder A, all constructed and operating substantially as and for the purpose set forth.

2. The slide E, with the cap *r*, slots *s s, g*, and finger *t*, in combination with the pin *d*, and the extractor-arm *c f*, when constructed substantially as and operating in the manner and for the purposes described.

Lifting-Jack. — Timothy Stebbins, San Francisco, Cal.—88,923.

I claim, in a lifting-jack, the weighted arm E, on the lever C, and the spring *c*, together with the pawl, having the curved end *h*, substantially as herein described.

This Lifting Jack is so constructed that heavy weights may be either raised or gradually lowered as desired, by the same movement of the lever. This is accomplished by means of a pawl, pivoted directly over the operating lever, having a curved projection at tbe end opposite that which operates in the rack. A weighted arm is hinged to tbe arm of the lever, and is thrown over so as to rest upon the curved projection, and by its weigbt free the pawl from the teeth when it is desired to lower the rack. And by operating the lever tbe pawl is freed from each tooth by the weighted arm at each downward movement and caused to catch the next tooth above as the lever is raised, striking a spring made of rubber or other suitable material. We shall soon give an illustration of this ingenious deviee.

Amalgamator.—Solomon Johnson, San Francisco, Cal.—88,963.

I claim making slotted openings D D, with dovetailing ends, to receive a crank-connection, or segmental rack, substantially as described.

An illustration and full description of this gold and eulphuret saving machine, may be seen in our issue of April 3d, 1869.

Combined Knob-Latch and Lock.—John McLeod, San Francisco, Cal.—88,874.

I claim the bar K and tumbler M, when arranged in relation to each other and to the key C, and the lug C, on the bolt B, substantially as herein set forth.

This improvement relates to spring locks, or night latches. It consists in so constructing the tumbler that when moved by the key in one direction it eo acts on a secondary bar as to eecurely stop the bolt, and whon moved in the opposite direction it releases the bolt so that it eau be operated by the knob, and will serve as an ordinary latch.

Putting a "Girdle Round the Earth" to Catch Swindlers.—Two Chiuamen, Hong Kee and Ah Ting, who muleted a large number of Clay street grain dealers and Front street liquor merchants in about tbe sum of $18,000, by making extensive purchases of flour and liquor, and absconding with their flour on the China steamer, have been headed off by a telegraphic dispatch via Point de Galle and Ceylon, which was carried thence to Hongkong by eteamer; the goods being recovered, but the Cbinamen eseaping in the crowd at the landing of the California eteamer. Cbina is rapidly learning to appreciate the arts of outside barbarians.

The New Commissioner of Patents.—Our Washington correspondent writes thus favorably of this newly-established officer,—S. S. Fisber: "He is the great patent lawyer of Cincinnati, and author of several worke on patent law which are highly valued. * * Probably one of the most capable persons for tbe position that can be found," etc. This commendation comes from an impartial-minded man, who has long been familiar with the Patent Department and its officers.

State Sabbath School Convention.—The second annual State Sabbath School Convention of California, will be held at the hall of the Young Men's Christian Association, 232 Sutter street, San Francisco, commencing on Tuesday evening, May 11th, delegates receiving free return tickets.

Pacific Protective Association of California.

INCORPORATED OCTOBER, 1868.

PROSPECTUS.

Object.—The object of this Association is to secure a cash payment, within sixty days after the death of a subscriber, to his or her heirs or assigns of as many dollars as there are individuals of the class to which said deceased subscriber belonged.

Membership.—The subscription fees are Ten Dollars at joining, and One Dollar on the death of each subscriber. The One Dollar from each subscriber is paid to the heirs or assigns of the deceased.

The Funds.—The By-Laws of the Association require that a portion of the money received as subscription fees shall be a Sinking Fund to meet assessments falling due by the delinquencies of subscribers. The balance of the money received to be used for the payment of the expenses incurred by the Association.

Members.—A subscriber failing to pay his or her assessment of one dollar within Thirty days from receipt of notice forfeits his or her Certificate, and all claims upon the Association, unless good cause is shown for further delay. A subscriber can forward money in advance which amount will be credited on future assessments. The subscribers are divided into classes including males and females. Each class is limited to 5,000 subscribers. As classes are filled, new ones will be formed. No person is so, nor that he cannot pay Ten Dollars at joining and One Dollar occasionally, thus securing $5,000 to his or her heirs or assigns.

Advantages.—The advantages of this Association are, that no *money panic* can affect it. Its benefits are easily obtainable by all, and every subscriber added to the Association enhances the interest and protection of all; the amount paid being so small, and only at long intervals, that any person can secure for his family a competency upon his death.

Classes.—In Class A, all persons between the ages of 15 and 40 years; in Class B, all persons between the ages of 40 and 60 years.

Any one that has not stated his or her age correctly, will forfeit all money paid and his or her Certificate.

One class cannot be assessed if one of another class dies. Classes have no connection with each other.

How to Become a Member.—A person desirous of becoming a subscriber must fill out an application, and forward with it Ten Dollars by Check, Draft, or by Express, in gold or silver coin. Persons can pay agents, when regularly appointed and authorized to receive money. Each subscriber should interest himself in obtaining new members, by so doing all are benefited

Board of Directors.—Benjamin H. Freeman, George H. Russell, Samuel A. Raymond, James A. Pritchard, W. Le Roy.

Officers.—Benjamin H. Freeman, President; George H. Russell, Vice President; John H. Warren, Secretary; James A. Pritchard, Treasurer.

References.—Hon. Henry Dutton, President of Farmers' and Mechanics' Bank; Hon. Samuel Cowles, late Judge County Court, San Francisco; Hon. A. J. Gunnison, Attorney at Law, San Francisco; H. J. Booth, Esq., Union Iron Works, San Francisco; Henry F. Williams, Esq., Real Estate, San Francisco; John O. Hanscom, Esq., Etna Iron Works, San Francisco; John H. O'Brien, Esq., of O'Brien, Bush & Co., San Francisco; Hon. J. P. Jones, Gold Hill, Nevada.

All communications should be addressed to the Secretary of the

Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL, for NEW YORK:

On the **10th, 17th** and **30th** of each month that has **30** days.

On the **10th, 18th** and **30th** of each month that has **31** days.

When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding; when the 17th falls on Sunday, they will leave on the Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departure of the 17th or 18th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained

The following Steamships will be dispatched on dates as given below:

May 8th—COLORADO.....Capt. Wm. H. Parker, Connecting with ALASKA, Capt. Gray.

May 18th—CONSTITUTION.....Capt. Wm. H. Hudson, Connecting with HENRY CHAUNCEY, Capt. Connor.

May 29th—GOLDEN CITY.....Capt. Wm. F. Lapidge, Connecting with ARIZONA, Capt Maury.

Passengers berthed through. Baggage checked through. One hundred pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets to Liverpool by the "Inman" and "National" Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £40 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight to New York and Way Ports, Company's Form of Bill Lading only used.

No Freight will be received on board after 2 P. M. of the day prior to the steamer's departure.

The Steamship JAPAN will be dispatched for YOKOHAMA and HONGKONG on TUESDAY, May 4th, 1869, at noon, connecting at YOKOHAMA with the steamer NEW YORK, for SHANGHAI.

For passage, freight and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skilful application of their soluble principle and elaborate machinery, produced what is so undeniably the per cetion of Prepared Cocoa, that it has not only secured the preference of home baths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers ½ de on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

ELLERY'S PATENT
India Rubber Cement and Paint
—FOR—
TIN, IRON AND METALLIC ROOFS,

Iron, Brick and Wooden Buildings,

SHIPS, STEAMBOATS, STAGES, CARS,

AND FOR ALL EXPOSED SURFACES.

Is water-proof and indestructible; will neither rot, peel, nor crack; will withstand any climate; can be put on in any color, and is less expensive than other Paint.

New Cloth Roofs put on. Old Roofs cemented and painted. Leaky Roofs made tight.

☞ No Coal Tar or Asphaltum used. All work guaranteed. Orders punctually attended to.

21v17-6y **J. WEICHHART, Proprietor.**

PATENT
Boiler Scraper and Tube-Cleaner.

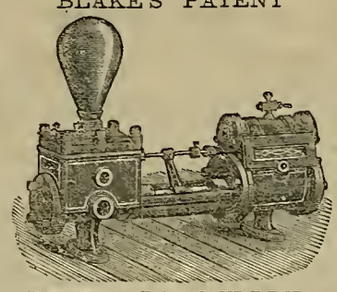
IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers where muddy water is used.

A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.

For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. D., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

BLAKE'S PATENT



STEAM PUMP!

This Pump is warranted superior to any in the market, for Breweries, Sugar Houses, Tanneries, Boiler-Feeders, Steamboats, Mining and Fire purposes, etc. It throws a full stream of the thickest beer mash without clogging, and sugar syrup boiling hot without difficulty.

Warranted a positive Pump under ALL circumstances; it never stops nor gets out of order, and by reason of the patent device in the valves, is kept clear and always ready for action. It is SIMPLE, COMPACT and POWERFUL, and needs no expert to run it.

☞ If one fails to do the work for which it is sold, it may be returned and the money will be refunded. May be seen in operation at Risdon's, or Union Iron Works, or at

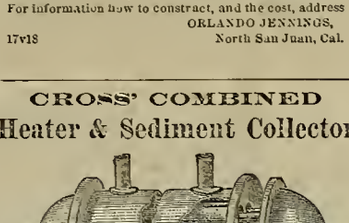
W. O. M. BERRY & CO'S,
Agents for Pacific States,
8v18 3m 114 California street, San Francisco.

A NEW SLUICE
For Concentrating Gold, Amalgam, Sulphurets or Black Sand, in Quartz Mills,
OR PLACER MINES.

It is made without Iron work, is cheap, durable, and effective; can be made by any good mining carpenter at the mine or mill, of sizes to separate the Sulphurets from one to fifty tons of sand per hour. There is no expense for motive power, or to handle the sand, if it can be run from the mine or mill directly into the receiving sizing boxes by means of water. It is continual, self-discharging, and can be used for concentrating fine gold and black sand, on the river bank or ocean beach. They may be seen at work in the American Company's Mine at North San Juan.

For information how to construct, and the cost, address
ORLANDO JENNINGS,
17v18 North San Juan, Cal.

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., of San Francisco, Keep & Bargion, of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to WM. B. CROSS,
15v18-3m Patentee, Sacramento, Cal.

REGISTER YOUR LETTERS containing money addressed to us, or we will not be responsible. Remittances by Express must be in packages, prepaid. When practicable, it is best to remit by draft, or order, on some San Francisco bank or firm.

SAN FRANCISCO
Pioneer Screen Works,
JOHN W. QUICK, Manufacturer.

Removed to A. Pritzel's Iron Works, 203 Fremont street, near Howard, San Francisco.

Screen Punching in all its branches, at rates reduced from 25 to 40 per cent less than the established rates. I can furnish Improved Quartz Screens several sizes finer than any screen ever punched, giving universal satisfaction, and for strength, cheapness and durability are not excelled. Also, Punched Screens of all sizes and fineness made from all qualities of material, for Quartz, Cement, Flour and Rice Mills, etc. Screen Punching made a specialty; therefore millmen forwarding their orders to me will receive none but the best. Orders solicited.

N. B.—J. W. QUICK is the only competent and successful manufacturer of Screens in the State, having made Screens for the principal mills in this State and adjoining Territories for many years. Quartz mill owners using punched Screens which have universally failed to give satisfaction, when visiting the city will please call and see me. 5v17-1y

HINKLE'S
"IMPROVED SPRING-BED BOTTOM."
(Patented July 21st, 1868.

The undersigned, having purchased the Patentee's interest in the States and Territories of the Pacific Coast, is now prepared to supply Private Houses, Hotels and Steamers with this comfortable, economical and durable "IMPROVED SPRING BED BOTTOM."

Persons going to White Pine will greatly promote their comfort by taking one of these Patent Bottoms, which is secured to a folding bedstead, the cost of which is less than that of the materials at White Pine.

Wareroom, No. 1092 Market Street.

Avery Pump and Tube Well.
Complete for Use.

The TUBE WELL is formed by driving prepared iron piping into the ground with a sledge. Although of comparatively recent invention, these wells have won a world-wide reputation, and are proven to be superior to the ordinary dug well, costing sometimes less than one-fourth that of others, and at the same time excluding the surface water and dirt. The tubing is coupled together in lengths of about six feet, as they are being driven into the earth; the valves are then dropped in and the Pump screwed down on top.

FORCE AND LIFT PUMPS

Always on hand. For ease of Working, durability and force, the Avery Pump has no superior. For circulars, etc., address Postoffice box 17.

White Pine Summary.

We find in our exchanges numerous "letters from White Pine" to friends in different parts of California and Nevada. These letters vary widely in their tone. Many were evidently written by men who, finding everything in the way of mining ground taken up, and seeing nothing to do by which to pay expenses, among the multitude of others similarly situated, jump, in their disgust, to the conclusion that the whole country is a "bilk;" that there are no mines except a rich deposit or two which are already in the hands of the capitalists; and that this is proved by these facts, viz: 1st, that the people there are wandering off still farther south, on prospecting trips for other districts; and 2d, that the shipments of bullion are not large.

On the other hand, the local journals say, "Wait until next fall"—"wait until we get a supply of mills—*then* you will see a different state of things." "Before next autumn our bullion product will equal that of the Comstock."

The tangible facts seem to be that there is extremely rich ore in Treasure Hill, and that a large extent of more or less rich mining country, covering a space reaching fifty miles or so in every direction from that point, will be opened up.

MINING ITEMS—EVENING STAR—STEWART.—*News* of April 14th: These mines are about 1000 feet south of the Eberhardt, and belong to a San Francisco company. They are both upon the same ledge. This, as far as opened, shows a width of seven feet, and it is intended to open a cross-cut to ascertain its width. On the dump pile is several tons of fine ore, which it is expected will mill at least $300 per ton. About 500 feet further down the hill is the Mahogany, also belonging to the company. This claim also shows very fine ore, with a ledge some three feet wide.

OCHA VERA.—This is near Hamilton. Ten men have been kept at work since the discovery, one week since. The developments show an average width of seven and a half feet. It is opened for a distance of forty feet on the surface, with numerous excavations, from which ore is taken giving an assay of $1,300 per ton.

U. S. GRANT.—Same of 16th: We were presented, yesterday, by Col. W. F. Johnston, one of the most magnificent specimens we have seen in White Pine. It was obtained from the U. S. Grant mine, a mammoth ledge, situated on the eastern slope of Treasure Hill. It was located in December, and its developments show a width of about forty feet, containing bodies of ore of the richest character. The specimen we have is a mass of chloride of silver, almost the pure metal, glistening in white wire slightly braided, and generally showing like a body of wax. Such a specimen could come from only the richest of veins.

EBERHARDT.—*News*, 20th: This company yesterday struck what appears an almost inexhaustible body of ore at a depth of one hundred and ninety feet from the surface, assays from average car samples of which have been obtained, ranging as high as $2,000 per ton. At this depth the ledge is found perfect, with well defined walls.

VELOCIPEDE HILL.—On this hill, situated a short distance south of Pocotillo Flat, prospecting is being carried on. Many of the claims present encouraging prospects.

ROSEBUD.—This claim, half a mile west of Chloride Flat, has been stripped for 50 feet, showing a vein of ore two feet in width. At the surface the rock assayed $161, and shows improvement at a greater depth.

HURST.—About one hundred tons of high grade ore have been taken from the middle shaft of this mine, and will be sent to the Newark mill for reduction.

AURORA CONSOLIDATED.—23d: This company yesterday commenced work on their shaft. It is the intention, we believe, to go down a considerable distance on the ledge, and drift each way for the purpose of ascertaining its exact width.

PROSPECTING ON THE BASE RANGE.—As the snow recedes prospectors ascend the Base Range. Already, and within the last few days, many promising claims have been located along the foot hills of this range of mountains.

HAMILTON MINES.—*Inland Empire*, April 15th: Prospecting around Hamilton has just commenced, and with such promising results that we have no doubt that when the mineral resources of the hills surrounding Hamilton have been developed, we will steal some of the laurels from Treasure Hill.

STRIKE.—16th: Last evening we saw a chunk of ore weighing about two pounds,

which was almost pure chloride of silver. It was taken from the surface of a ledge discovered yesterday, located between Hamilton and the Virginia mine.

Bullion.—17th: The first National Bank have on their counter six bricks, amounting in the aggregate to $10,500, which will be shipped to New York to-day. They are from rock out of the Eberhardt mine, worked at the White Pine mill.

Mills and Smelting Works.—*News*, 31th: The foundation for a quartz mill from Aurora is being laid half a mile below Shermantown. A. Kolab's 8-stamp rotary battery is also being put up one mile below the Cañon City. The foundation for a third mill, still further down the cañon, is being dug out.

News, 15th: Three first class quartz mills are in course of construction in Shermantown, which will be in running order in a few weeks. A vast quantity of ore is accumulating about Treasure Hill, and these mills and others will be kept busily employed for months. Shermantown promises to be the busiest milling town in the State.

Same of 15th: The smelting works at Swanson, above Shermantown, commenced work yesterday.

Quartz Mill for Patterson.—Same of 16th: We understand that negotiations are pending for the purchase of a quartz mill at Austin, to be shipped to Patterson District.

The old Manhattan mill from Washoe, has all arrived on the ground, and grading is being done for the boilers, and the frame of the building is being put up. The mill is being put up at the spring, about one mile and a half east of Hamilton.

Eureka District.—*Empire*, 17th: There is in process of completion at Eureka, a smelting furnace of capacity sufficient to reduce 10 tons of ore per day. This furnace has been constructed under the direction of A. D. Stettefeldt, a gentleman of experience and high attainments in the art of smelting ores, and great confidence is felt in the successful working of the same.

Outside Districts.—*News*, 13th: Seymour and Troy.—The first named of these is south of Grant. Many fine ledges have been discovered, and are now being prospected. The bank of California, it is said, has men locating and opening claims in the district. Troy District is six miles south of Seymour, and also contains many fine ledges and much rich ore.

Robinson,—Same of 14th: The City of London, is the name of an argentiferous quartz ledge in Robinson District, which, in size, surpasses any similarly rich body of ore in America. The croppings stand fifteen feet above the surface of the ground, are one hundred and fifty feet wide, and extend two hundred feet along an isolated hill or ridge dividing the upper end of Robinson Valley. Two samples—one broken from each side of the ledge—eight feet above the ground, were assayed by Theall & Co., of Hamilton, yesterday, the one showing $336 15 to the ton, and the other $360 06.

Patterson—Same of 17th: There are 250 recorded locations in this district. Two mills are to be erected. Timber is abundant....We were yesterday shown a quantity of excellent ore from the McClune ledge, assays from which were obtained averaging about $500 per ton.

Reveille, 22d: We have been informed that sixteen claims in this district sold a few days since for $50,000. A 20-stamp mill will be put up in a short time by one company, and an 8-stamp mill by another company. In addition to the above, $15,000 is to be paid for four mines, and $6,000 for another claim. A later report by same Journal is to the effect that the purchase has not been consummated, owing to a disposition on the part of present owners to hold.

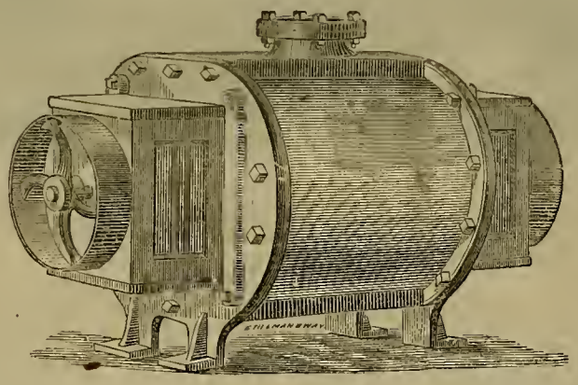
Robinson—*News*, 23d: Messrs. Lamb, Hicks and Russel are progressing rapidly with their new road from Hamilton through Robinson District, which is to connect with the Egan or Bingham road, at Brown's ranch. Other parties are also going to work immediately, to construct an extension of this road across the Shell Creek range of mountains to the Snake Monntain District. This will bring the productive valleys of Southern Utah in direct and easy communication with White Pine, and thereby materially reduce the expense of living here.

Eureka—*Empire*, 15th: Assays give the Gem credit $2,000 per ton. This district is situated about 40 miles west from White Pine, in what is known as the Diamond range. The ledges are innumerable, large and promising, varying from six to forty feet in width. They contain principally smelting ores, carrying from $100 to $2,100 per ton in silver.

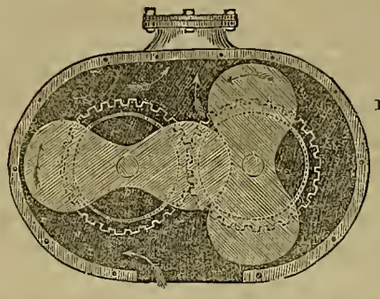
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.



ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address

KEEP & BARGION,
Globe Iron Works, Stockton, Cal.

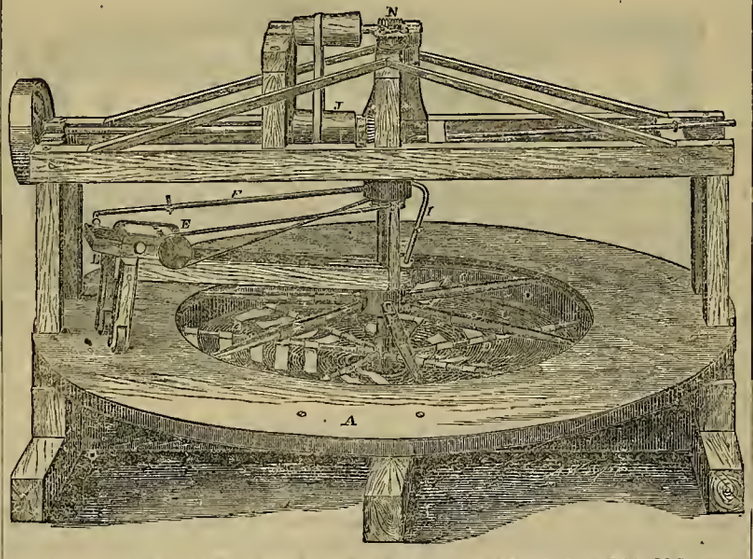
PAINE & STEPHENS' IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.



One Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps,

Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Banner Co's mill near Nevada, and see for themselves.

CERTIFICATES:

Grass Valley, Jan. 4th, 1869.—This is to certify, that we have used the Paine, Stephens & Harry Concentrators for over twelve months. They have given us entire satisfaction, and are the best we ever used.
WILLIAM WATT, Supt. Eureka Mine.

This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphuret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets.
WM. L. TISDALE, Supt. Star Spangled Banner Mine.

Nevada City, Oct. 26, 1868.

Any one wishing to purchase one of these useful machines, can do so by applying to THOS. N. PAINE, at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.

LEA & PERRINS'
CELEBRATED
WORCESTERSHIRE SAUCE

Declared by connoisseurs to be the only
GOOD SAUCE.

The success of this most delicious and unrivalled condiment having caused certain dealers to apply the name of "Worcestershire Sauce to their own inferior compounds, the public is hereby informed that the only way to secure the genuine, is to ask for

Lea & Perrins' Sauce,

and see that their names are upon the wrapper, labels, stopper, and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against Manufacturers and Vendors of such, or any other imitations by which their right may be infringed.

Caution against Fraud.

Ask for LEA & PERRINS' Sauce, and see name on the Wrapper, Label, Bottle, and Stopper.

Wholesale and for Export by the Proprietors, Worcester; Crosse & Blackwell, London, etc., etc.; and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 3v18-6m

SULPHURETS;
What they are;
How Assayed;
How Concentrated;
And How Worked;
With a Chapter on the
BLOW-PIPE ASSAY OF MINERALS.

By WM. BARSTOW, M. D.

Published by A. Roman & Co., San Francisco.

For sale at this Office.—Price, One Dollar.

With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 21v15tf

The Railroad Celebration.

The Convention of the different organizations in this State have held their meetings pursnant to call, at the Mechanics' Institute Building, and decided after mnch deliberation to appoint a Committee of Arrangements to cousist of one from each organization there represented, whose duty it should be to appoint two hundred citizens, to coöperate with themselves in perfecting arrangements for the celebration. The committee was appointed as follows:

J. R. Bachelder, of the Eight-Hour League; J. Wilcox, of the Mechanics' Institute; H. Blakeman, of the Turn Verein; James Patterson, of the Cabinet Makers' Association; Alexander McAbee, of the Dashaways; J. C. Laugton, Lodge No. 123, I. O. O. F.; C. B. Culver, of Parker Lodge No. 24; J. H. Develine, of the Iron Moulders' Union; H. B. Livingston, of the California Pioneers; G. W. Barter, of the Grand Army of the Republic; W. Crowhurst, of the Occidental Lodge No. 3, Sons of Temperance; F. Tittle, of Norma Grove Druids; Adam Smith, of the Independent Order of Red Men; James A. Hall, of the Bricklayers' Association; C. Killmeyer, of the Eureka Typographical Union; J. T. Gray, of the Plumbers' and Gas Fitters' Association.

The Committee was instructed to report at an adjourned meeting of the Convention to be held last (Friday) evening.

THE CELEBRATION AT SACRAMENTO.

Great preparations are also being made for a celebration at Sacramento, in which the citizens and public bodies in all parts of the State are cordially invited to nnite. Mr. C. H. Swift has been selected to act as President of the Day; Rev. J. A. Benton will act as Chaplain; Gov. Haight will deliver the address, and L. E. Crane will pronounce a poem. The exercises will be held on Front street, on the spot where the grounds for the railroad was first broken. There will be a large military as well as civic display. Most of the military from this city are expected to be present. It is stated that all other routes of travel to and from the city will be free on that day.

We are not advised as to the day on which the celebration will take place, bnt presume, if possible, it will be on the day on which the connecting rail will be spiked down. At all events, when that is done, the fact will be announced by the screaming of every steam whistle in the city, the ringing of bells, firing of salutes, etc. We presume that arrangements will be made for a similar demonstration in this city—that all may be made aware of the very moment when the great event takes place.

BULLION PRODUCT OF WASHOE.—The bullion prodnct of the mines about Virginia City, for the quarter endiug April 1st, was $2,040,885; total dividends for same period $588,000; total assessments $156,200. The above figures show an excess of dividends, over assessments, of $431,800, which sum represents the aggregate profits of the Virginia and Gold Hill mines for the first qnarter of the present year.

CALIFORNIA
BUSINESS UNIVERSITY,
204 Montgomery Street.

Full particulars regarding our Practical Course of Studies may be had by calling at the University, or by addressing
17v17-qy12p E. P. HEALD, San Francisco.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

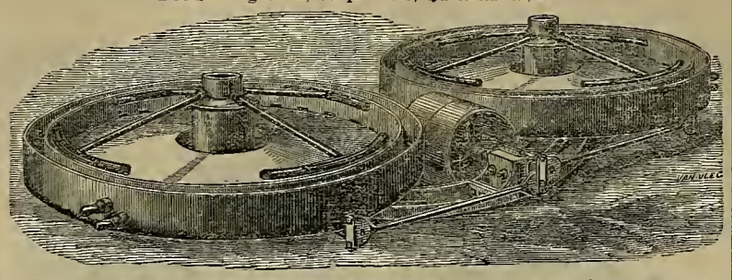
Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $135 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

HUNGERFORD'S IMPROVED CONCENTRATOR,
For Saving Gold, Sulphurets, Quicksilver, etc.



There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

RECOMMENDATIONS:

San Francisco, October 19th, 1868.

MR. M. HUNGERFORD—*Dear Sir*:—We have had twelve of your Concentrators at work at the Oneida Mine, Amador County, for about six months. They give entire satisfaction. They are strong and substantial, requiring, thus far, no repairs, and do their work thoroughly and effectively. At a recent clean-up of four of them, I found that in four weeks' time we saved about $500 in free gold, besides the sulphurets, or not far from one dollar per ton on the entire crushing of the ten stamps connected with them. In my opinion, it is for the interest of every quartz mill to have your machines. Yours, respectfully, GEORGE PRINGLE, Supt. Oneida Mine.

OFFICE OF THE ONEIDA MINING COMPANY, Jackson, May 13th 1868

MR. MORGAN HUNGERFORD—*Dear Sir*:—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any others I have used. I have ordered Messrs. Goss & Lambard to make eight more for me as soon as possible. Very truly yours, JAMES MORGAN.

BIG OAK FLAT, May 25th, 1868.—*Mr. T. W. Mulford*—DearSir:—I have used two of M. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

The Hungerford Concentrator has only to be seen to be appreciated. No millman will use any other kind after he has tried that. They are in active operation in mills throughout the State, and give perfect satisfaction.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

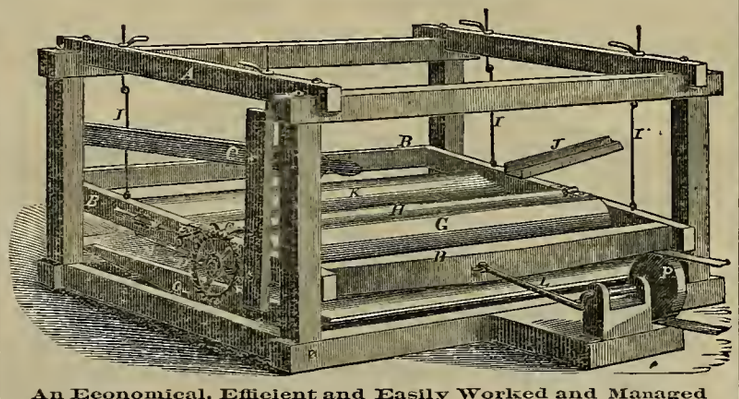
In future these Pans will be manufactured by GONNARD & Co., at the Pacific Iron Works, San Francisco, which is a guarantee that they will be built in the most substantial manner.

These Pans may be seen at the Pacific Iron Works, First street, near Howard, San Francisco.

Address,
GODDARD & CO., San Francisco.
Or M. HUNGERFORD, at the Pacific Iron Works.

18v17eow

BRYAN'S SELF-DISCHARGING ENDLESS BLANKET
CONCENTRATOR.



An Economical, Efficient and Easily Worked and Managed Machine.

This new and recently patented machine is fully described in the Mining and Scientific Press of Jnnuary 16, 1869.

It operates as follows:—The pulp from the stamp mill flows down the spout J, upon the upper end of the blanket surface, which is extended like a belt between the rollers (G and K), and indented by the smaller roller H, running on the top of the blanket close to G, so as to make a kind of trough beyond H, with a shelving bottom (K). The slope of the rollers and blankets is towards the left, being adjustable to suit the ore by the screws and rods I I, by which the entire blanket and roller arrangement swings in the wooden frame A.

Now an oscillatory motion is given to the swinging blanket frame B B, by means of the pulley P, and rod L. This causes the pulp and accompanying water at K to ripple down along the shelving channel in little wavelets, towards the point of discharge of the tailings E. For every oscillation of the blanket frame, the pawl F catches in a new tooth on the rachet wheel D, revolving the rollers, and so causing the blanket channel, and upper surface, to move from us, and to carry the heavy particles up the shelving slope K, and over the farther roller, into a tank underneath N, which is filled with water to wash off the sulphurets, which are deposited in the tank. The heaviest and best quality of sulphurets will be found at the upper end of the tank under K.

ALFRED BEMIS, Agent, Warren, Idaho.

These Machines are manufactured by A. BRONSON, at Hobbs & Gilmore's, corner of Market and Beale streets, San Francisco. They are meeting with great favor, and giving general satisfaction wherever introduced. For rights in Idaho, address ALFRED BEMIS, Warren, Idaho. Full particulars can be obtained by addressing the inventor,

JOHN M. BRYAN,
San Francisco.

ENGINEERING MISCELLANY.—Blasting; River Improvements; Bridges, etc.

AGRICULTURAL MISCELLANY—Cultivation of the Orange; What Shall we do with Our Wheat, etc.

MECHANICAL MISCELLANY.—New Process of Tanning; Cast-welding of Steel and Iron; Machine Dentistry; Breaking Iron and Steel Masses; Promoters of Vaporization, etc.

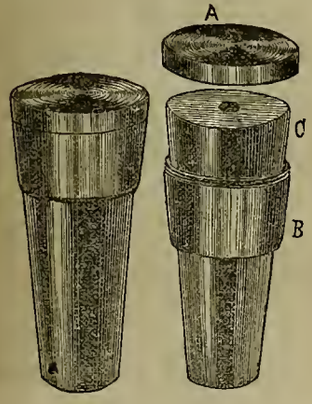
SCIENTIFIC MISCELLANY.—Effect of Light on Mineral Oils; Expansion of Freezing Water; Diamond Making; New Chemical Relations of Aluminum, etc.

MINING SUMMARY—Comprising late intelligence from the various counties and districts in California, Colorado, Montana, Mexico, Nevada and Oregon.

San Francisco Market Rates.

Haviland's Ornamental Bottle Cork Top.

An ornamental cork or bottle top, for saloon bottles, being a recognized desideratum amongst bar-keepers, no less in virtue of giving an air of neatness to an establishment than the more utilitarian consideration of cleanliness, Mr. John T. Haviland, of the crockery and glassware establishment of Harviland, Hooper & Co. at No. 335 Pine street, has devised a material improvement upon the defective article commonly in use. Common bottle corks are generally capped with a silver plate top, held to the cork by means of a rivet or wire running through the latter, and clinching with a



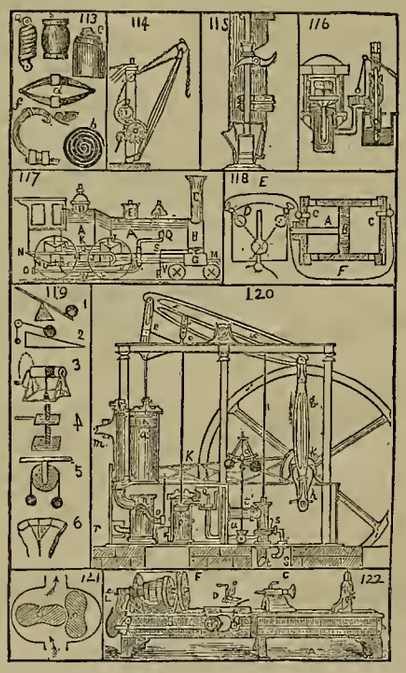
nut or soldered knob on the inner end, which is exposed to the acids and the alcohol of the liquor. The result is that the soldering is soon destroyed, the liquor contaminated and rendered injurious, while an unsightly end of corroded wire only is left sticking out.

Mr. Haviland's cork top will be best understood by reference to the annexed engraving. The right hand representation shows it in two separate parts; B, a ring fitting around the ordinary cone-shaped cork, and in such a manner as not to permit the latter to slip entirely through, and a top or end piece, A, which is screwed on the other. The left hand figure shows the cork top screwed together, as adjusted for use. Two additional important advantages are secured. The Haviland top affords width enough to enable the fingers to grasp and draw the cork by it, keeping the latter clean, while ordinary corks soon get dirty and bad looking, from frequent handling; and the present top is easily adjustable to any number of new corks in succession, never wearing out, or becoming worse for wear. Bar-keepers appreciate these qualities so fully, that of the ten gross of Haviland tops thus far manufactured, nearly all have been sold. A patent for the above has been secured through Dewey & Co.

Mechanical Movements.

CONCLUSION.

The larger cut, this week, concludes (from page 241,) our illustrations of the mechanical movements, by the aid of which we have taken our readers of an inventive



turn, through a direct and tolerable complete course in practical mechanics. Some of the most useful combinations, in every day working machinery, are represented—the crane, hydraulic press, stamp mill, steam engine, locomotive, lathe, gas engine, and blower.

113. The principal and most common variety of springs used in machinery: *a*, spiral spring; *h*, india rubber spring; *e*, the volute spring, made of sheet-steel wound, cone-shaped; *d*, elliptic spring; *f*, the C spring; *b*, coiled or watch-spring.

114. Common Derrick crane.

115. Sectional side view of a quartz mill battery. The mortar at the bottom is partly V-shaped, containing the die setting on the bed; stamp resting on the die; stem extending upward through the cross-timbers or guides; tappet on the upper part of stem resting on the cam that raises and drops the stamp, stem and tappet together at each revolution.

116. Hydrostatic press. Water forced by the pump on the right through the small pipe into the ram cylinder, and under the solid ram on the left, presses up the ram. The amount of force obtained is in proportion to the relative areas or squares of diameters of the pump-plunger and ram. Suppose, for instance, the pump-plunger to be one inch diameter and the ram thirty inches, the upward pressure received by the ram would be 900 times the downward pressure of the plunger. The same principle is applied in hydrostatic jacks, and for massive brick buildings.

117. Locomotive engine. The boiler, A A, and the engines, of which G is one cylinder, rest on the frame which extends from N to M, and contains the jaws and driving-boxes under the springs, as shown. The frame rests in front on the springs of the forward truck, of which X X are the wheels, and hangs behind on the equalizing beam K, extending to the springs. The circle H H represents the trailing-driver, and J J the leading-driver. B is the smoke-box, C the chimney, W the ash-pan, E the sand-box, and D the steam dome just forward of the cab. The line V G represents the piston-rod, U V the connecting-rod, and U U the parallel rod. T is the steam-chest, containing the valve; T, S the valve-rod, and S R the rocker arms on the rock-shaft. The link-motion extends between the forward driving-shaft and the arm R, and, with R S T, forms the valve-gear. The pumps P (forward of leading-driver) draw water from the tender through the feed-pipe O P, and force it into the boiler through the check-valve Q.

118. Improved Lenoir gas engine—a French invention. The piston-head D is represented midway of the cylinder; A, piston-rod; a gas jet is introduced with a quantity of air sufficient for combustion at each end of the cylinder alternately, and ignited by an electric spark by conducting wires E and F at c c. The electric spark is generated at the proper moment by the poles of the galvanic battery becoming momentarily connected by revolution at D.

119. The six mechanical powers which are the basis of all mechanical movements and combinations: 1, lever; 2, inclined plane; 3, wheel and axle; 4, screw; 5, pulley; 6, wedge.

120. Condensing beam-engine. *a*, steam-cylinder; *b*, piston; *c*, upper steam-port or passage; *d*, lower steam-port; *e e*, parallel motion; *f f*, beam; *g*, connecting-rod; *h*, crank; *i i*, fly-wheel; *k k*, eccentric and its rod for working the steam-valve; *l*, steam-valve and valve-casing; *m*, throttle-valve; *n*, condenser; *o*, injection-cock; *p*, air-pump; *q*, hot-well; *r*, shifting-valve, for creating a vacuum in the condenser, previous to starting the engine; *s*, feed-pump for supplying the boilers; *t*, cold water pump for supplying the condenser cistern; *u*, governor.

121. Sectional view of Root's patent blower for furnaces, etc. Air is drawn in through the lower pipe and forced out in the direction indicated by the arrows by the rapid revolution of the double vanes which closely follow each other and the inner side of the shell or case containing them.

122. Engine lathe. Upon the shears, or framing, A, stand the fixed head-stock, M, (which carries the spindle and face-plate, F,) the movable tail-stock, C, and the compound rest, D, which is moved longitudinally by the lead-screw, actuated by the feed, L, and upon which stand the tool-stock and tool-rest.

This series of mechanical movements, together with a digest of Patent Law, and other information valuable to inventors, will be issued by us in pamphlet form and circulated free, forming the most correct and carefully prepared patent circulars yet published gratuitously.

THE "EARTH CLOSET" AND THE TREATMENT OF WOUNDS.—The dry earth plan first suggested by the English curate, the Rev. Mr. Moule, promises to make him as famous among the benefactors of the race as the immortal Jenner. The wonderful improvement which it is capable of effecting in the sanitary condition of hospitals, is already beginning to be recognized. Still another mode of applying it has recently been introduced and practiced by Dr. Hewson of the Pennsylvania Hospital. A patient was suffering from a compound fracture of the leg. The wound, in spite of all treatment, was in a most unhealthy condition; and the excessive purulent discharges filled the ward with an insufferable and absolutely dangerous stench. The dry earth was applied as a *dernier resort*. The effect was magical. The odor was entirely destroyed; the wound moreover at once underwent a marked improvement,—and in a few days had a perfectly healthy appearance. Subsequent experiments with other patients were equally satisfactory. Not only old and unhealthy ulcers, but fresh lacerated wounds,—both of the soft parts and of bones,—and burns, were treated in this way; and in every instance, the effect, in the relief of pain, and prevention of excessive and exhausting suppuration, was all that could be desired. Surely a boon, as great as that conferred in the disarming of the destroyer small-pox, has here been vouchsafed to poor humanity.

TIME OF TRANSIT.—It is stated that as soon as the railroad is completed, and in proper working order, trips will be made from San Francisco to New York in six days. So that a person starting from this city on Monday morning will be landed in New York on the next Saturday evening. To accomplish this 27½ miles an hour must be made, without any allowance for stoppage; a speed readily attainable on a first class railroad. We shall soon be able to comprehend the advantage which the railroad will give to the inhabitants of this coast; in the way of quick communication with the Atlantic seaboard.

THE OFFICIAL REPORT of the last Mechanics' Institute Fair, held between August 8th and September 12th, 1868, has been published, embracing the reports of the several committies, and making a pamphlet of 94 pages.

BUSINESS is lively at the Wallamette Iron Works.

Communications.

[Written for the Mining and Scientific Press.

Development of Permanent interests in Mining Sections.

"A Miner" furnishes the following suggestions on the subject of fostering permanent interests in mining sections:—"The foot hills of California present a country rich in every natural resource. A fine climate, not excelled by Spain or Italy; hills covered with the white oak, the live oak, and the ground carpeted with the burr clover, alfalfa and wild oats, and beautified by flowers, with range enough of non-cultivated earth for the sustenance of thousands of cattle, sheep and hogs; yet their supplies of meat are driven from the southern countries and Texas, and the bacon and hams freighted at great cost from Oregon, through San Francisco. Thousands of tons of all kinds of vegetables are carried up the Sacramento river to supply the quartz miners and millmen who are distributed through this belt of mines. Thus the mines and mills, instead of having a producing country immediately surrounding them, and being themselves sustained, encouraged and made profitable by cheap and fresh supplies and plenty of labor, sustain a population hundreds of miles from wants and necessities. How to revitalize and people this beautiful country is the object of this communication.

Could the incubus which causes this abnormal state of things be removed, no part of the State would present so fine a field for diversified industry. Water power on the American, Cosumnes, Mokelumne, Calavaras, Tuolumne and Merced, are sufficiently numerous to move every industry that California may foster. Though there are no large areas of what would be called farming land, yet there are plenty of small valleys and sloping hill-sides which can be cultivated easily for cereals and planted with orchards and vineyards, with all the fruits of the temperate zone, and some bordering on the tropical, as the fig, lemon and orange. The finest fruit ever raised in the State came from this section. The mountain or foot-hill wines are pronounced superior to any imported from France or the Rhine, and the vineyards from which they were pressed are languishing in the hands of the proprietors for want of sufficient encouragement in the sale of their pure juice, even to keep their families above want. Though newspapers daily tell their readers how profitable vine-growing and wine-making is, it is not, nor can it be, till their products can find a remunerative market without a cost for freight of 25 per cent. of its value.

I would suggest, in the way of legislation: First, that our national law gives place to a revised land system, stating especially, in plain law, that land shall only be sold to actual occupants, and those who mean to retain them for improvement. It would not only benefit this portion of the State, but it is an absolute necessity for every part of it where United States land lies, to prevent the fairest portions from being absorbed by the idle wealth of San Francisco, to the great detriment of its speedy settlement and prosperity.

Second—put all the land belonging to the government in the market for sale at $1.25 per acre, without any distinction as to whether mineral or agricultural. This will be favored by a large majority of the present residents. The importance of this can be realized or estimated, only by those who have seen the loss sustained, energies crippled and final despair and abandonment of what could, and probably would have been comfortable and permanent homes, had the settler obtained proprietary rights over his domain. The want of this ownership or absolute right to the land, has been the crushing blight of the country.

Where the land is claimed and occupied, respect the right and give the title, but compel the payment; have it also understood, explicity, that one individual has but *one right* to one claim, either mineral or agricultural, which should not be transferable for five years from date of title and payment. The object should be to encourage the many. If any one, after trying a tract, should find a mine on it, he could prospect it either as a mine or hold it subject to his leisure and the convenience of his agriculture or horticulture—neither need to give way till it was fully demonstrated which would be most valuable. Such a law would open this section more fully to settlement than has been done by the indiscriminate and wholesale grab which has been and is now prevalent. The wholesale destruction of timber and wood, for which the government has never received any compensation, would be stopped. The vandal despoiling of gardens, orchards and farms, which are overturned by the inexorable mining law, would cease, and the farmer, as miner and farmer, would judge for himself which occupation would be most profitable, and follow the same in a systematic manner, for the benefit of himself and his place. Thus the government would get pay for its land, every one would have a chance for a home, a farm or a mine, and the counties would receive the population necessary to relieve or distribute the heavy burden of taxation now barring them from large population. Under such a system emigration would be encouraged to come to the State; for no other portion could offer such chances for a certain return for labor. A great part of the mines are yet capable of producing from one to three dollars a day from old gold washings which the farmer settler could gather in the winter season, when in other sections he would remain idle and profitless. The quartz mines and mills would be a market for the surplus wood which would be cut to clear his field for seed or tree, also for much of his grain, vegetables and fruit. It is generally believed that there is much mining country yet undeveloped and unclaimed through these foot-hills. But a stranger cannot go into the seemingly wildest district and commence the opening of any appearing ledge without being soon disturbed with the fiat, "You're working on my claim."

The same names will be found on the record claiming nearly the whole district, comprising several square miles; in many places without any compliance with the laws of that district, and at others, with the merest scratching of a hole to be called "work on a claim." The remedy proposed would break up this wholesale grabbing. Even now the same errors are running "overland" with the speed of the railroad, contracting, griping and throttling every discovered mineral region in our vast interior. Prospectors on individual risks, and as agents for companies have gone and are going with the avowed purpose of discovering new ground, forming new districts, making their own laws, and gobbling the whole. The main purpose in the let-alone policy of the Government was to leave the mines as free as air. Selfishness and greed for speculation has sadly warped that purpose, and it is necessary for the protection of all that the license of the few be restrained, in order that every one may have a chance."

[Written for the Mining and Scientific Press.]

Origin of Our Amalgamation Processes.

EDITORS PRESS:—As much is being said just now about the origin of processes, it is a good time to put in a word or two about the origin of the "Paul & Wood" process. As to the "pan process," I know nothing of its origin, nor do I envy anyone the doubtful honor of having introduced a barbarous method, by which many million dollars worth of silver and mercury have been, and are daily being thrown away. But "J. S." is surely quite wrong in supposing that which is known as the *pan process*, (by which I understand treatment in *iron* pans, with or without chemicals) to be identical with the Mexican *fondo* process, in which a *copper* pan is used, in connection with "*patio* chemicals," or with ore containing the equivalents of these.

The leading feature of the fondo process is *the action of the cupric chlorides on the ores of silver*, and the *reproduction of these chlorides by the copper pan*, so that the substitution of the iron pan not only changed the process, but actually ruined it; and the absurd attempt to use "patio chemicals," or to obtain the patio reactions, in iron pans, was but little creditable to the knowledge or judgment of the individual who made it.

In the *Herald* of March 13th, is a long article on the so-called Paul & Wood process in which the origin, or discovery of the process is touched on very incorrectly. I seldom notice anything the "profane" papers say on such subjects, considering the PRESS to be the only qualified exponent on this coast, of matters metallurgical or chemical; but this article of the *Herald* contains statements so erroneous as to require comment.

The process was discovered by Mr. Wood, nine years ago, as he assures me. I know that he consulted me as to danger of explosion, and described his process and experiments with a quicksilver flask, in the fall of 1867.

In his experiments a few months ago, he extracted about *half* the silver, from ores which yield 90 per cent. by the *fondo* process. I obtained precisely the same results in an open iron mortar over a fire, and so can anyone.

The process may be a good one; I believe it is so, for gold.

While on the subject of the *Herald's* article, let me correct another mistake which is a gross libel on the metallurgical skill of the country, as well as on the character of the ores of the Kearsarge district. These, it states, are "very rebellious," and cannot be worked by any of the "old systems." All this is simply nonsense. The ores of this district *were* worked successfully in 1866, at the European metallurgical works in San Francisco; and if the same was not done at the company's works, it was simply because the means of doing it were not provided. When a furnace was put up, it was a very poor affair, and there was neither "scientific expert" or any other person present who knew how to roast ores.

Moreover, it is well known, to at least some members of that company, that a person in the vicinity has been ready at any moment, during the last year and a half, to work those ores without roasting, and get fine bullion too; and he has proved his ability to do so, as Mr. Wood will testify; and the process is one of the "old systems," if two or three hundred years will justify that designation but it can't be done in *iron* pans. "Let justice be done," etc.

CHARLES H. AARON.

Lone Pine, April 14th, 1869.

Vein Systems of White Pine.

Gen. Cadwalader, author of the latest map of White Pine and of all those portions of the accompanying pamphlet relating to its vein characteristics and geology—quoted approvingly by us in our issue of April 10th—writes a lengthy and able communication to the *Bulletin* of April 23d, in which he shows himself to be an observer of facts, and a thinker on the subject of the origin and phenomena of vein deposits, not ignorant of their chemistry and geology, but refreshingly self-confident, and profoundly disregardful of the labors, opinions, and even the existence of a score of writers recognized from having devoted the best part of their lives to the same subject, as authorities, and well known to the readers of this journal. We will leave Mr. Cadwalader peacefully in possession of his eruptive vein theories, whether molten or pasty, and his "*eighteen systems* of true fissure veins" and "one false N. W. and S. E. system"—no more and no less, from Cape Horn to Alaska,—and proceed to condense from his observations that which we consider definite enough to be of value if only in the least degree founded upon facts. Here are certainly systems enough to furnish every locating record with one, or several to intersect; and it is safe therefore to predict that destiny will bear the author's fame aloft, from the stock and change offices of Montgomery street to the highest summits of Treasure Hill. But there are others, equally competent, who do not hesitate to express their opinion that there is not such a thing as a true vein to be found on Treasure Hill—the gap between whom is certainly more than is "in a name."

White Pine, says Mr. Cadwalader, has ten distinct systems of veins in addition to the great northwest courses which, though false in some places, assume the diguity of true veins. The systems are as follows, viz:

Courses.	*Dip.*	*Distance of Parallels.*
No. 1—N. 5° W., and S. 5° E.	East.	22 yards.
No. 2—N. 12 E., and S. 12 W.	West.	20 "
No. 3—N. 15 W., and S. 15 E.	West.	24 "
No. 4—N. 25 W., and S. 25 E.	East.	22 "
No. 5—N. 25 E., and S. 25 W.	East.	20 "
No. 6—N. 45 E., and S. 45 W.	N. W.	19 "
No. 7—N. 75 E., and L. 75 W.	South.	18 "
No. 8—N. 85 E., and S. 85 W.	North.	20 "
No. 9—N. 80 W., and S. 80 E.	South.	18 "
No. 10—N. 75 W., and S. 75 E.	North.	16 "

The great northern courses, 1, 2, 3 and 4, successfully "contest the false northwestern courses" in giving marked features to Treasure Hill, while the eastern courses are distinctly obvious, not only on the Hill, but on the opposite Pogonip and Mokomoke mountains.

To No. 1 belong the Aurora, Eberhardt and North Point veins; including the Louisiana on the east, the Summit on the west, the Mammoth to the north, a vein seen in Treasure Hill tunnel, a point on Chloride Flat, and the apex of Treasure peak.

To No. 2 the Hidden Treasure, Emmereley and Featherstone.

To No. 3 the Copper Silver Glance, and Virginia.

To No. 4 the El Dorado, Bonito Juarez, Excelsior, Silver Sixpence, Chloride Flat, Eberhardt, and Standing Stone.

To No. 5 Aladdin's Lamp, West Virginia, and Hornet.

To No. 6 part of the Hidden Treasure, apparently, and the summit of Treasure Ridge,—presenting a well-walled, rich vein 12 feet wide at top.

To No. 7 the Keystone and two other veins in the Eberhardt, the California, the Phœnix, the Ervine, the Glacier, the Eclipse, and many other veins on Chloride and Bromide flats.

Nos. 8 and 9, not exposed by work, but obvious on both east and west flanks of the hill.

No. 10, the Post Hole, and Blue Bell.

A Congress of Veins.—In accounting for the Eberhardt deposit, Mr. Cadwalader says: A single vein is incapable of producing so much wealth. Nothing but a congress could achieve it. Seven different veins have conspired to produce this wonder, with a strong presumption of another being accessory. At the head of the ridge and at the foot of the cliff the Keystone and two other parallel veins of the eyetem No. 7, course N. 75° E., and these veins are intruded upon, and interlaced by a No. 1, a No. 4, and a No. 6 vein, and also by the Blue Bell, which has a course slightly transverse to the No. 7 veins, making what is called the south wall, inconsistent with the north wall of the Keystone. It will be observed that the north wall of the Keystone has the southern and characteristic dip of class 7, and its foot-wall should be concurrent. This is not so, and the dip and strike being both different, it is conclusive they belong to different systems. Leave the ridge either east or west and the three No. 7 veins will disentangle themselves and appear definitely and distinct. Scrutinize the north wall of the Keystone, and it will be found fractured by a N. 45° E. vein, that not only defaces its regularity, but degrades its ore to an unsatisfactory extent.

Accounting for Chlorination.—The presumption that the chlorination of the veins in Treasure Hill is caused by the ocean waters, is undoubtedly a mistake. Their effect would be superficial. A more profound cause is required to account for the phenomena, and that cause is the effusion of muriatic acid gases from below. If the ocean was the agent, how happens it that the Pogonip and the long range of mountains to the north and south, are excepted from its action? Treasure Hill is the exception. It has been fumed on by insidious gases from internal fires, and the chloride ores are commensurate in depth with the hight of the mountain.

Relative Age, and Intersections Forming Chimneys.—The east and west veins have their birth in regular order round by the north. The early veins are intersected and interfered with by those of later date, and are generally more metamorphosed than the north and south. The disposition is to pour out strength in certain places, *i. e.* make chimneys, so that a vein, in its course of four or five miles over the mountains, may make half a dozen chimneys, leaving the intervals weakly endowed with ore, and in some cases destitute. The succeeding systems may, in some cases, conspire to issue in and increase the size of the previous chimneys, while in others they will expire in the weak places of the preëxistent vein, making one the radical here and the other there, though in all places the respective veins are apparent to a conversant eye.

PHYSOLOGICAL EXPERIMENT.—Prof. Dickson recently made the following curious experiment: A few grains of barley were placed before a hungry pigeon, which at once began pecking. During this operation the brain of the pigeon was frozen by means of a spray of ether, and the bird being thus suddenly deprived of conciousness, ceased pecking, and remained for awhile as if deprived of life. At this moment the grains of barley were all cleared away, and the ether spray having ceased, the brain was allowed to thaw; the bird returned in a short time, as it were, to life, and the first thing it did was to continue pecking for awhile, though no grains were present.

Mechanical.

New Process of Tanning.—An new English plan for preparing hides is thus described:—After the hair and particles of flesh have been removed, and the hides cleaned by lime, the hides are placed in water separately, with the fleshy side upwards, and sprinkled with bran in proportions, varying according to their character, from 6 to 14 ounces for each. In this vat they remain until fermentation has taken place, which will be, in warm weather, in about two days, but in cold somewhat longer. After this they must be removed and scraped. They are then subjected to the action of mustard seed in the following manner: A vat is filled with a sufficiency of water to cover the skins, and to this water is added for every hundred-weight of the skins, when dry, five pounds of ground Italian mustard seed, and five pounds of barley meal. When these have been mixed with the water, the skins must be dipped therein, from 24 to 48 hours, according to circumstances. They are then taken out and partially dried. The dip has the effect to open the pores of the skins, and to render the tanning by means of bark much more speedy.

Cast-welding of Steel and Iron.—This is a new process for making steel-topped nails. A steel ingot mold, in two halves, which can be fastened together by bands and keys, is used. A file of scrap-iron, which is forged to the proper shape, and which does not fill the mold, is then heated to bright redness and placed in the mold. Melted cast-steel is immediately poured in to fill the vacant space. The union of the iron and steel is perfect. The ingot is then rolled to the proper shape in the usual manner; care being taken to drive the rollers slowly, as in working an ingot entirely of steel. The *Engineer* thinks the invention full of promise.

Potatoes a Preventive of Boiler Scale. *Engineering* lately examined the interior of a boiler which was entirely free from scale of any kind; and although it had been in constant use for 14 months, the hammer marks around the rivet heads were as clear and sharp as when the boiler was first set to work. The practice of the engineer had been simply to introduce some 25 pounds of potatoes into the boiler every week, at the safety valve, after blowing off and refilling. The effect was found to be that all the solid matters were deposited by the water in the form of an extremely fine powder, which was completely removed when the boiler was blown out.

"Of the manner,"—says that journal,—"in which the potatoes act in preventing the formation of a hard scale we have not yet been able to arrive at a satisfactory explanation; but that they do prevent it is a fact which it is well worth while to record, particularly as, unlike some other "preventives," they give rise to no injurious action on the boiler plates or fittings."

Camera, Torpedo and Electric Battery.—The Antwerp engineers have planned an ingenious arrangement for defending the passage of the Scheldt;—blowing up the ships of an enemy, while looking on at their leisure "from afar off." Torpedoes are placed in lines at proper distances; and the camera on shore so arranged that the image shown in it indicates the moment when a ship is directly over a torpedo. At this instant the infernal machine is exploded by means of an electric battery, which is in connection with it.

The Henry-Martini Rifle.—The English Government Special Committee have finally recommended the adoption of a composite rifle made up of the Martini breech mechanism and the Henry barrel. The committee has been in session nearly two years.

Machine Dentistry—Ingenious Device.—A Michigan correspondent of the *Scientific American* describes a little apparatus, contrived by a resident dentist, for dressing out and under-cutting the cavities in teeth before filling them, for dressing off the foil after the filling was completed, and for polishing. A reciprocating motion was added for sawing or filing between the teeth. It was a very small rotary engine, operated with compressed air furnished by two pairs of common bellows worked by the foot. The engine weighed but 8¼ ounces. The air was conducted to it from the bellows by a ¼ inch rubber tube. The small burrs driven by it, rotated at a speed of 4000 per minute. With this apparatus, the ordinary work of one hour could be accomplished in two minutes.

Promoters of Vaporization.—This term was applied by Faraday to solid bodies introduced into a liquid, near its boiling point, to "start" ebullition—in other words aid the escape of vapor. From a paper recently read by Mr. C. Tomlinson before the Royal Society, the *Mechanics' Magazine* quotes the following:—"Among these "promoters," coke and charcoal are the most active, and the results of some experiments made suggest the introduction of a bushel or two of one of them into every steam boiler. Thus, when water was boiled for twenty minutes in a glass flask alone, 995 grains boiled away, but when some pieces of coke were added, 1,130 grains of water boiled away in the same time. An experiment with wood charcoal had more striking results. Water was made to distil freely from a still, and the quantity collected in fifteen minutes was weighed. Some pieces of charcoal were then added, and the distillate again collected during the fifteen minutes. From the water alone 262 grains were collected; from the water with charcoal, 334 grains; that is, upwards of one-fourth more water was evaporated when the charcoal was used."

Breaking Iron and Steel Masses.—Pieces of cast iron of considerable size are very difficult to break up. The following method has been practiced successfully at the works of Petin & Gaudet: A round hole, two or three inches in diameter and ten to twelve inches deep, is bored in the mass to be split; this hole is filed with water and closed by a closely-fitting steel cylinder, upon which the drop is allowed to fall from the usual hight. The mass is thereby split into several pieces, as if by a strong wedge with several faces. The water cannot escape, and its endeavor to do so bursts the metal. In this way a plate roll of 29½ inches diameter was split into four or five pieces, which flew twenty or thirty feet away from the drop. The hole must be hermetically closed, and in order to do this thoroughly it is necessary to hollow out the base of the steel cylinder into a cup-shaped form, the edges of which are driven against the walls of the hole by water, in its efforts to get past.

To Coat Iron with Silver.—Cast iron can be coated with silver by means of a moderately strong galvanic battery, by using the following:—One ounce of lunar caustic is to be dissolved at a boiling heat in sixteen ounces of distilled water, to which, diluted, two ounces of cyanide of potassium are to be added. The whole is then to be mixed with forty-eight ounces of water, in which one ounce of salt has been dissolved. The cast iron is to be freed from any oxide just before silvering, by means of weak nitric acid applied for a few minutes.—*Iron Age.*

Dry Ore Concentrator.—A New Yorker named Pearce has patented a concentrator which consists of a revolving distributor from which the dry pulverized ore is thrown by centrifugal force. The heaviest particles fall, of course, at the greatest distance from the center; and thus the ore is seized in concentric rings or receivers, each of which has its brush or scraper revolving within it.

Device for Joining Belts.—A late English invention consists in a slotted piece of iron through which the two ends to be joined are inserted,—both in the same direction. Between these, on the opposite side, is placed an iron wedge, furnished with teeth upon both sides to prevent its loosening when the band is slackened.

Scientific Miscellany.

Effect of Light on Mineral Oils.

Herr Grotowsky, at a recent meeting in Halle, Germany, made some communications on a new property of photogenic hydrocarbon oils, discovered by him. In exposing such oils to the influence of light by means of glass balloons, he found that they absorbed oxygen and converted the same into its allotropic condition, ozone. It was found that the air was even ozonized in well-corked vessels, the effect being to some degree also dependent upon the color of the glass. By "photogen" oils from peat or bituminous coals, are meant those which distil between 212° and 550° Fah., and are of specific gravity 0.795 to 0.805. The term "solar oil" is given to oils of from 0.830 to 0.835.

The observations were to the following effect:

Photogen and solar oils stored in barrels and cisterns lined inside with iron, remained free from ozone, and their burning was faultless. Oils kept in balloons of white glass, wrapped in straw, showed traces of ozone, but burned well otherwise; in white glass painted black, exhibited traces of ozone; in unwrapped and white glass balloons which had been kept in the open air, gave very strong indications of ozone,—burning very badly, charring the wick, and nearly extinguishing the flame after burning for six or eight hours.

Solar oil, which had been exposed to light in unwrapped balloons of green glass gave strong indications of ozone, but though the wick charred, burned well; in green balloons, painted black, contained ozone; it burned, however, perfectly well; in green balloons wrapped in straw, gave indication of ozone; it burned like the former.

American kerosene from petroleum, which had been exposed to the light in white and unwrapped glass balloons, had become strongly ozonized, so much so that it scarcely burned; some which had been kept in the dark for three months did not show ozone, and burned perfectly well. These experiments were made by exposing the oils tested from April to July, 1868. Prof. A. Ott, from whose article in the *Journal of Applied Chemistry* we condense the above, says:

Though the experimenter favors the opinion that the oxygen of the air, in being absorbed by the oil, and converted into ozone, does not effect any chemical change, but remains simply absorbed, it cannot be seen why such oils should deposit carbon when burned. They should, on the contrary, burn better. There is only one way possible, by which we may account for the decrease in the illuminating power, viz.: The ozone seizes a part of the hydrogen and forms water therewith, while a higher carbonated oil remains."

New Chemical Relations of Aluminum.—Prof. Henry Wurtz says that the result of his experiments with aluminum is the conclusion that the normal and *stable* form of that metal corresponds to the "passive" (usually *unstable*) form of other metals. Under ordinary circumstances it is in an *electro-negative* state towards oxidizers, but when in absolute chemical contact with quicksilver, it assumes an abnormal state, corresponding to the normal states of sodium and potassium,—and is intensely *electro-positive* with regard to oxygen and water. A leaf of aluminum thrown upon a clean pool of quicksilver, instantly adheres to its surface, but only from the cohesive attraction of the metals,—for there is no oxidation. But if now the edges of the leaf be *torn*, real *chemical* adhesion between the two takes place at the torn edge, and the leaf will gradually be changed into a white feathery hydrate of alumina. The passive (or repellent to quicksilver) film, extends to some depth from the surface; unlike the corresponding film upon *gold*, which is exceedingly thin.

The Mound Builders of Tennessee.—Dr. Joseph Jones contributes an article upon this subject to the *American Naturalist* for April. He made explorations of several of these mounds; and describes stone implements and pottery, pictures and carvings of the sun and moon, skeletons and stone coffins, vases and copper ornaments, arrow-heads and shells. It is not very easy to understand from the article whether or not Dr. Jones considers all these remains as belonging to the same age. He speaks of the mound builders as worshippers of the sun, and says that circumstances point to Mexico as their native country. In another place he says: "The important conclusion which we draw from these investigations is: That the race which erected the mounds and fortifications of Tennessee was existing and active at the time of the discovery of North America, and possessed the country with a numerous population, even as late as the exploration of De Soto.. This conclusion, which is at variance with the theories propounded by various ethnologists of Europe and America, who assign a considerable period to the extinction of the mound builders, will be still farther sustained by the remarkable discovery which we have made during the progress of these investigations, of the cross, emblems of the Christian religion, and especially of the Trinity, the Savior and the Virgin Mary."

In another place, again, he says: "That the aborigines of Tennessee were idolaters, is manifest from the stone and clay idols, which have been found in various portions of the State, some of which were found in caves, and others upon the summit of high mounds."

Expansion of Freezing Water.—Prof. Van der Wyde, in the *Gaslight Journal*, says that he has experimented upon this point, with great care, down to a temperature of 20° below zero. He finds that ice possesses its greatest volume at 32° Fah., and then contracts, as it cools, like most bodies; but never down to the volume which it occupied before freezing. He adds:

"Sometime ago an English savant asserted that ice expanded when cooled to very low temperatures; this opinion was based on the observation that a bombshell filled with water, and which had not burst by the freezing of all the water, finally did burst when cooled to below 0° Fah. But the cause of this bursting was simply that the cooling and contraction of the iron shell was previous to that of the solid nucleus of ice; it became therefore at very low temperature too small for the ice ball contained in it; ice being a poor conductor of heat, an ice ball will be slow in contracting by cold to its very center."

Bottom of the Sea.—The mud at the bottom of the sea consists largely of organic matter, more or less decomposed, interspersed with minute round bodies, about sixteen one-hundredths of an inch in diameter, called cocospheres and cocolites. Immense numbers of minute shells are also found. The mud is excessively sticky, being rendered so by minute pellets of a jelly-like consistence. These are found to contain great numbers of granules, from one four-thousandth to one twenty-thousandth of an inch in diameter, undoubtedly organic in character, forming one of the representatives of the common ground between plants and animals.

Diamond Making.—Mr. Sorby finds that the microscopic cavities in diamonds, described by Sir David Brewster, are enclosed crystals. Of these the *Chemical News* says: "The crystals enclosed in diamonds are frequently seen to be surrounded by a series of fine radiating cracks, which are proved to be the result of the contraction suffered by the diamond in solidifying over the enclosed crystal, and this explanation has been artificially verified by examining crystals formed in fused globules of borax glass, cooled slowly, when the same phenomena are seen."

Minute diamond crystals may be deposited upon one of the carbon points of a battery, produced by the fusion and re-crystallization of the carbon from the other point. The following experiment has been made in France: "A piece of charcoal was subjected *in vacuo* to the concentrated rays from a powerful burning glass, and at the same time to the galvanic current from an immense battery. It is reported to have *volatilized without fusing*. It now remains,—suggests the *American Journal of Mining*,—for our modern diamond-makers "to subject carbon to a heat as intense as that of the last-mentioned experiment, removed from contact with the air, and under a pressure sufficient to prevent its volatilization."

A Uniform Source of Light.—For the purpose of experimentation on the measurement of luminous intensity, Mr. Crookes used, as a uniform source of light, a glass lamp containing a mixture of five volumes of alcohol, and one volume of benzol. The wick consisted of fifty-two pieces of platinum wire of 0.01 inch diameter. The flame burns at the uniform rate of 136 grains per hour.

Engineering.

BLASTING.—Some of the mine owners at Grass Valley are at loggerheads with their underground men on the giant powder question. The latter say that it causes headache, and that its gases are injurious to health. Of such injurious effect in frequent cases that are given, there can be no doubt; but it is claimed that it is not the gases after explosion but during the handling, that operate injuriously, and the manufacturers are said to have recently employed new ingredients, with a view to avoiding even that objection. There appears to be no dispute, from any quarter, of the claim that the giant powder offers important advantages on the score of economy—the use of the single hand drill, to forty per cent. more of execution, while the cost is not near in the same increased proportion. Mixture of nitro-glycerine with silicions, or other matter, has done away with nearly all of the danger of that explosive,—though we hear this week of a fatal accident at Manzanita Hill on the Yuba, where the remnants from a failed and drawn charge were set off by "sounding" some loosened rocks with a sledge. The risks with the giant powder do not appear to be greater, however, than with the common nitro-carbon powder. Though nitro-glycerine is still the operating agent, its physical properties and the tendencies to decomposition are so different, as to render the present substance worthy of a new name. Why it has been baptised giant powder in this country, when the inventor and the rest of the world have always known it as dynamite, appears less clear, unless merely the policy of introducing a new thing by a good name.

Great blasts are the order of the day. It can be reckoned out mathematically, that the more powder, the less outlay is there per cubic yard. But in point of fact, as demonstrated by the cash principle, it seems that even mathematics may be thrown relatively amongst the inexact sciences. The cost of working away rock or gravel enters so largely into the economy of large blasts, that the Smartsville experiment of December with 15 tons, though successful as a blast, is considered by many of the miners to have been practically a failure. In solid rock at Lime Point, Cal. Mendell has been using a still larger quantity, but to what advantage a few months work will determine better than can be done at present. The Smartsville ground had not all been piped down at last accounts.

RIVER IMPROVEMENTS.—Messrs. Fassett and McCaulley are engaged in cutting a new navigation channel through the right bank of San Ramon creek, Contra Costa county, two miles above its mouth, where, by opening a distance of 150 yards, the steamer's time from the bay to Pachcco, can be reduced twenty minutes. By thus shortening and straightening the channel it is believed also that the water will be deepened in the flats.

A correspondent of the *Union* reports that the Commission appointed by the last Legislature—the State Surveyor General, John W. Bost, Wm. S. Green of Colusa, and Amos Mathews of Yolo,—to devise or determine the practicability of a plan for the protection of the low lands of Sacramento Valley, by cutting a new outlet into Suisun bay, are giving great attention to the subject and have in view a plan by which the waters of the rivers may be controlled and carried through a new outlet into the most eastern branch of Suisun bay. It is understood that the plan contemplates tapping the Sacramento at two or more points, one of which will be opposite the mouth of the American river. On account of the constant filling up of the rivers and low lands it is deemed a necessity that a new channel should be made.

The work of dredging the channel at the mouth of the Willamette is progressing rapidly, says a Portland telegram of April 26th, and the continued low water favors the work at this season.

San Lorenzo creek periodically commits great depredations in the town of Santa Cruz. During the past two winters it has been encroaching, says the *Sentinel*, on the western bank, opposite the Blackburn orchard. F. A. Hihn, two years ago had piles driven across the head, but they were soon washed away. He is now engaged in filling in the channel with brush, and topping off by gradiog with clay and gravel. It is proposed to continue the improvement until the river current makes a channel east of the piles now standing, when the break will be mended by a double row of piles and the enclosure left to fill in with driftwood and sediment, from the winter freshets. A straight channel being thus secured, it is believed that twice the usual quantity of water will be carried through it without overflowing.

BRIDGES.—The Marysville *Appeal* says that city now possesses the longest bridge in the State—that completed across the Yuba and the land it overflows. It is one and one-eighth of a mile in length.

A new self-supporting heavy frame bridge, of more than sixty feet span, is being now erected over Walnut creek, at the lower crossing, in Pacheco, Contra Costa County.

BLOSSOM ROCK.—A contract has been let for removing Blossom Rock, in San Francisco harbor,—about 10,000 cubic yards,—to a depth of twenty-four feet at low tide, for $45,000 currency. The highest part of it is now five feet below low tide.

COMMENDABLE.—The following paragraph appeared among the telegraphic news of Wednesday evening:

"It has been determined that no appointments for Principal Examiner in the Patent Office shall be made from persons outside the Bureau; experience in the busines being required."

Perhaps no business has suffered so much from the previous system of rotation in office as that of the Patent Office. From its nature, it is impossible for a new man, however well he may be skilled in any particular art or science which may become his especial charge, to fulfill the duties of the office satisfactorily, as an Examiner. The Patent Office is filled with models of inventions patented, rejected and pending, and it requires the familiarity of a long experience with the business and in the usages of the office, to detect and understand the patentable parts of an invention. The appointment of men to these important positions simply because they are friends to the political party which may happen at the time to be in power, has been very damaging to the interests of inventors, and we are glad to see another step taken in the right direction.

VELOCIPEDE LAW.—It may be interesting to velocipedists to know that some of the conflicting patents on this vehicle are now before the Eastern courts, and it will probably soon be determined how far the manufacture can be controlled by individuals. There are at least three important patents, either of which will claim a royalty if successful. One, the McKenzie patent, owned by W. Smith, was granted in 1862 on "a centering hobby-horse," and has lately been re-issued so as to cover as far as words can do it, the present machine, or at least the use of cranks. Another, the Lallement patent, also claims the use of the treadles, and is owned by Calvin Witty; while a third, the Haulon patent, claims the bifurcated reach or perch, the variable cranks and the adjustable saddle. Suit was brought by Smith against Witty in the United States Circuit Court, on the 5th of April, and a motion for Witty to show cause why redress should not be granted, was to be argued. Meantime, each of the claimants are serving notices on the different manufacturers, to desist, or "pay up."

ARTICLES on Woodside's rubber carriage and wagon spring—a valuable invention of almost universal application; and on a new quicksilver region in Mexico, are unavoidably crowded out till our next issue.

WEEKLY STOCK CIRCULAR.—On account of the Railroad jubilee to-day our paper is issued earlier than usual, and we are under the necessity of omitting the Stock Circular.

California Academy of Sciences.

A regular meeting of the Academy took place on Monday evening, May 3d, the President, Dr. Blake in the chair.

NEW MEMBERS.

Messrs. Herman Simon, Siegfried Simon, and Eugene Arnstein were elected members. Mr. Heyneman was proposed for membership.

LIBRARY, ETC.

Besides the usual large budget of scientific periodicals and society exchanges, donations were reported from Prof. W. P. Blake of his Geographical and Geological Notes of Stickeen River, Russian America, and Report on the Precious Metals at the Paris Exhibition.

Communications were received from a Reading (Pa.) Scientific Society, relating to exchanges, etc.

MOLLUSKS IN THE SAN JOAQUIN TULES.

Mr. Henry Carlton presented verbal and written notes descriptive of seventeen species of shells found in the San Joaquin tules, nine miles above Antioch, mainly fresh water, and of interest, because on the verge of tide water where they are occasionally covered with salt water.

Mr. Bloomer said similar species were found at San Diego and beyond. The *oscalons* were common in Mexico, in producing which, this region resembled Mexico. There was a region of sand-hills beyond Mt. Diablo, near the water, which seemed to produce peculiar conditions for their existence.

ACCLIMATIZATION OF FISH.

Dr. Gibbons made some suggestions with regard to the possibility of acclimatizing on our coast some of the best Eastern market fish; shad, for example, and other species not now existing here. Collecting eggs of fishes, and their distribution without cost, he said, had been inaugurated in the Atlantic States, and supplies could be had. He inquired whether trouffles (?) existed here. (Dr. Blake thought there was a species). Hogs and dogs indicated their presence; some persons were affected by them in passing over them.

STATUS OF MULBERRY AND SILK CULTURE.

In regard to the mulberry, Dr. Gibbons said in '64 there were four million trees growing. Each tree produced ten cuttings. Now there were about fifteen millions growing. The designs of the State bounty had been defeated on account of the demand for cocoons—no silk whatever being made. State bounty has been paid for these worthless cocoons. A friend informed him that there would be silk premium demands large enough to empty the coffers of the State—say for about $500,000. Newman could not get enough of silk, scarcely, to make two flags—one for the State, and one for the U. S. States Capitol.

RAMIE.

In regard to the cultivation of the ramie plant, Dr. Gibbons said there were two species of it. The Canadensis or Indian hemp, had long been cultivated in China, and was known as China grass. It had a small seed, and was usually cultivated by root cuttings, and stands drought. In Louisiana, three crops could be raised a year. It is treated much like flax, and may be prepared for manufacturing in twenty-four hours after cutting. Specimen presented by A. J. Moulder. In England and France it is mixed with cotton, wool and silk. The opinion was expressed and concurred in that California would be its proper home.

Mr. Bolander said he had correspounded with Dr. Ferd. Mullor, of Melbourne Botanical Gardens, who said it did well there. Then it surely would do here, but it needed cheap labor.

Dr. Gibbons said he was informed from England that there would be a great demand for the ramie shortly. A few ounces of seed had been sent to California by English merchants.

NEW ZEALAND FLAX FOR PAPER.

Mr. Bolander said the New Zealand flax had been used in Australia for making paper, and was the best article for the purpose that could be had. It grew everywhere luxuriously. There was an essay on ramie in Dr. Muller's Melbourne Botanical Garden Report. The tule lands of California would be just the thing for ramie, and also for the New Zealand paper plant, a specimen of which is to be seen growing in the post-office plot in San Francisco. It grew in wet or dry soil. For textile fabrics the latter was not firm enough. A gentleman near Vallejo had 200 to 300 acres of ramie in growth, and expected to profit largely by it.

Dr. Blake said it had been largely planted at Stockton.

DEVELOPMENT OF SEEDS IN CALIFORNIA.

Mr. Bolander said seeds always, of all plants brought here, developed large, and more thoroughly than elsewhere, owing to dryness of climate, and the favorable intense light of our climate.

OPIUM IN CALIFORNIA.

Dr. Gibbons was surprised that opium had not been raised here, considering its prices. One man could gather a pound a day. An insane man at Stockton had raised a very fine article—so pronounced by Dr. Tilden. It was the old-fashioned common poppy. Scratches were made in the head, in the evening; by morning the milk condensed, and the extract was then scraped off—requiring no additional treatment. Rain in the night destroys the opium.

TEAZLE.

Dr. Bolander said teazle was another plant of great demand, not raised here. It grows very rank in California, and develops better than in the Eastern States. It pays very well. A report is given of the cultivation of fifty acres, in the last Agricultural Department volume.

Mr. Bloomer said wild species grow at Saucelito, etc.

Mr. Bolander said they grew in Sonoma Valley also. With all these plants, so much needed, our farmers could do well. Their origin was southerly—Turkey and Asia Minor—and Chinese labor was to be had to carry out their cultivation profitably.

Dr. Gibbons said it was astonishing, when there were so many inventive Yankees, that no adequate imitation had been invented to take the place of teazle.

Mr. Bolander spoke of an old French farmer in the interior of New York who commenced growing teazle when all the others were extirpating it, and was laughed at for it. It is now grown considerably in Western States.

Dr. Blake said the freight and packing were considerations slightly unfavorable.

BASKET WILLOWS.

Dr. Bolander said we had no native willows in California that would stand twisting. Considering the quantity brought here in ships, for baskets—all of which were imported,—he thought the planting of basket, willows would pay well. Once planted, the stock was permanent. In gulches, etc., they would protect the soil.

Dr. Gibbons said Dupont's powder was made of willow and poplar charcoal. Between Wilmington and Newcastle, Delaware, there was a ditch planted with willows for that purpose. They were cut once in two years.

FOREST PLANTING.

Mr. Bolander said in regard to forest raising, it was known that several species of eucaliptus were never attacked by the *toredo;* therefore, several European governments had planted all their spare land with it. In ten years every tree would represent a cord of wood. As timber, it would bring twice as much as ordinary timber. California had more reason to guard her forests than the Eastern States. It was their duty to call the attention of the California legislature to the matter. Hill land, in tracts of 100 to 1,000 acres should be given favorably to private parties for planting. Forest-growing in the East, even, had paid; according to last Agricultural Reports it paid better there than grain raising on an average. We had ten or fifteen species here. He expected that the State University would devote large gardens to experiments in plants, to develop our resources. Melbourne had done very much in that way. Reports were printed and circulated freely to that end.

SUBJECT OF ACCLIMATIZATION.

Dr. Blake said there was no country in the world where an acclimatization society would be so useful as in California.

Mr. Bolander stated (in reply to Mr. Carleton) that a company had been formed in San Francisco to introduce the shad in California. As important as these matters were here, it was a pity and a shame that the Academy of Sciences was left so limited in its means.

Dr. Blake said farmers were raising wheat, when they might as well do other things that were more profitable. They would find it out in time.

Dr. Bolander said this State was best adapted to 10-acre pieces of land devoted to these special products, to which we are adapted. He mentioned a natural celery plant which was very good—growing on our hillsides on dry rocks. Adjourned.

FOSSILS AND COAL.—G. A. Lloyd, of Hamilton, has sent us some interesting fossils from the recently located coal fields at White Pine. They will be noticed soon.

Company Transactions.

New Incorporations.

New articles of incorporatien have been filed, as reported in our exchanges during the past week, in the County Clerk's office in this city, and the Secretary of State's office at Sacramento, etc., as follows:

MINING COMPANIES.

THE SWANSEA COAL MINING COMPANY, County Clerk's office, Treasure City, April 25th. Capital stock, $1,000,000, divided into 10,000 shares of the par value of $100 each. The property is situated along the road between Shermantown and Hamilton, and consists of four quarter sections of land.

THE SEDGLEY TUNNEL AND SILVER MINING COMPANY, San Francisco, May 3d. Location, Treasure City, White Pine. Capital stock, $1,000,000 ; shares, $100 each. Trustees—Abnor Sedgley, Geo. L. Smith, J. P. Rogers, W. C. Sullivan and T. R. Posey.

THE SOROCCO MINING Co., San Francisco, May 6th. Location, White Pine. Capital stock, 300,000, divided into 100 shares of $100 each. The Trnstees are A. K. Harmen, J. S. Rae, J. H. Jones.

MISCELLANEOUS.

UNION PACIFIC SALT Co., San Francisco, May 5th. The object is to manufacture, produce, import, export, buy, sell and trado in salt. Capital stock, $300,000; 3,000 shares of $100 each. Trnstees—John Barton, S. E. Oakley, A. B. Winager, S. H. Tyler, and A. W. Jee.

HESPERIAN LAND, SAVINGS AND LOAN ASSOCIATION, San Francisco, May 4th. The object is to buy and sell real estate and to loan money. Capitnl stock, $50,000, with the rigbt to increase the amount to $100,000. Number of sbares, 20, of $2,500 each. Trustees—R. Abbey, Charles Elliott, Hermann Schnessler, E. A. Derricke and John McKewen.

CARSON RIVER, WALKER LAKE AND SILVER PEAK WAGON ROAD Co., organized at Wadswortb, Nev., April 30th, and incorporated at Carsou. Trnstees—E. M. Geiger, H. Allurah, T. G. Herman, G. W. Sawyer, A. Coffman, M. V. Gilbert and M. Raphael. E. M. Geiger bas been appointed President and H. Allurah Secretary. This road will open communication between Wadsworth and a large country to the soutbcast, comprising Silver Peak and Columbia districts, and will give a more direct road to Belmont, Ione, cte.

Meetings, Elections, Etc.

THE GARDEN TRACT HOMESTEAD ADDITION was organized in this city on May 4tb, as follows: President, A. S. Gould ; Vice-President, John P. Wiuchester ; Treasurer, W. G. Doolittle ; Secretary, F. B. Wilde ; Trustees—A. S. Gould, John P. Winchester. W. G. Doolittle, F. B. Wilde, J. K. C. Hobbs, J. F. Bradford and W. G. Frinck. The property is situated at South San Francisco, between tbe easterly line of the San Bruno road and the western line of the Garden Tract Homestead Association.

THE IDA SILVER MINING Co., on May 3d, elected the following Trustees ; A. Sedgley (President), G. L. Smitb (Treasurer and Secretary), W. A. Lampe, W. H. Howard, and R. A. Boyle. D. P. Bell was appointed Superintendent.

THE PALMER SILVER MINE, White Pine. The following named gentlemen were on May 3d elected Trustees for the ensuing year : W. H. Burnett, W. C. Sullivan, A. Sedgley, R. A. Boyle and Geo. L. Smitb. At a meeting of the Trustees A. Sedgley was elected President, G. L. Smith Secretary and Treasurer, and D. P. Bell, Superintendent. A unanimous vote of thanks was extended to the former Secrctary, J. M. Buffington, for the efficient manner in wbicb he bad conducted the affairs of the company.

THE PLANET COPPER MINING Co. M. M. Baldwin, William Patten and James McCloskey were, at the annual meeting in San Francisco, May 3d, chosen Trustees for the ensuiug year. J. C. Hutchinson was appointed Secretary and Treasurer. Tbe claim is in Williams' Fork District, Arizona Territory. Ore assays from 30 to 60 per cent.

CAYUGA CHIEF MINING Co. The followiug Trustees were elected at the annual meeting in this city, held May 3d : J. A. Eatou, G. W. Beaver, John Nightingale, J. P. Couch and R. G. Brown.

ORIGINAL HIDDEN TREASURE MINING Co. Trustees elected May 3d : G. W. Beaver, G. D. Roberts, E. B. Dorsey, R. F. Morrow, F. L. Castle, M. J. McDonald, S. Heydenfelt.

CHEROKEE LANE GRAVEL ROAD Co. Officers elected in Stockton : L. U. Shippee, President ; H. T. Compton, Secretary ; J. M. Kelsey, Treasurer ; Directors, C. Swain, W. D. Ashley, R. B. Parker, J. C. Gago, C. L. Robinson.

THE WHITE PINE MUTUAL MINING AND MILLING Co. Trustees elected, San Francisco, May 3d : John Grant (President), J. E. de la Montagnie (Vice-President), O. P. Sutton (Treasurer), John A. Stanley, F. G. Smith, John Nigbtingale and A. W. Blair. Thomas J. Owens was chosen Secretary.

THE CINDERELLA GOLD AND SILVER MINING Co., White Pine. Trnstees elected San Francisco, May 4th, when 3,732 sbares were represented : Nathan H. Seligman (President), A. Goldsmith, Joseph Benrimo (Treasurer), M. Mayblum and L. J. Henry. A. Martinon was continued as Secretary.

INDEPENDENCE QUARTZ M. Co. Trnstees, elected, San Francisco, May 5th : A. Wood, R. C. Beattie, and C. J. Klein. Alfred Wood was chosen President and Superintendent, and F. G. Smith Secretary.

SAN FRANCISCO AND OAKLAND R. R. Co. Directors elected, San Francisco, May 5tb: F. B. Atherton, Alfred A. Coben, W. C. Ralston, D. O. Mills and D. P. Barstow.

New Patents Issued to Pacific Coast Inventors.

FOR THE WEEK ENDING APRIL 20th.

DRAIN-TILE MACHINE.—Robert Gordon Carlyle, San Francisco, Cal., assignor to A. C. Robinson, W. J. X. Robinson, and J. H. Addison, assignor to John H. Wise. —89,199.

I claim 1. The combination of the shaft A and water tube with the core-barrel, having a conical spiral-bladed top, the lower die-plate M, and casing N, the whole arranged and operated substantially as and for the purpose set forth.

2. The combination of the vertically-moving core-barrel B, and its rollers *a a*, with the square shaft A, as set forth.

STILL.—George Johnston, San Francisco, Cal.—89,225.

I claim, 1. The furnace D, with the two flues E and F, and the adjustable slide, or damper G, for transferring, regulating, and stopping the heat, substantially as herein described.

2. The curved pipe T, and the valve V, or an equivalent device for converting the heating-chamber into a chamber of the still, substantially as described.

3. The device consisting of the heating-vessel A, together with the vessel B, with its chambers and passages intervening between the vessel A, and the refrigerating apparatus, when constructed and operating substantially as herein described.

4. Regulating the temperature of the chambers of the vessel B, by means of water passing through the pipe *i*, or an equivalent device, substantially as described.

New Inventions.

ONE-WHEELED VELOCIPEDE.—John Carroll, of McAdams, says the Yreka *Union*, is building a one-wheeled velocipede, which he is confident will " go."

A NEW CATCH.—The Nevada *Transcript* speaks of a new "catch," which is designed as a substitute for the spring usually applied to wagons, for holding the tail-board. It consists of a quarter circle of flat iron, on the under side of which are three notches. These can both be raised by a lever at one side, and the notches catch and hold the door at any desired position. The *Transcript* says the contrivance is exceedingly simple and looks as though it ought to work well.

THE FIRE IN THE GOLD HILL MINES is not yet fully subdued. It was found a day or two since that smoke and gas have increased to such an extent in the Crown Point, Kentuck and Yellow Jacket mines, that the workmen were again driven out, and the shafts reclosed and steam once more sent down. The *Enterprise* says that somebody asserts the fire is between the 700 and 600-foot levels, and it is expected it will soon be subdued. This assertion is like those the public have been fed upon for the last twenty days—somebody's guesswork. The fact is, the mines are on fire, and the fire cannot be reached and the mines cannot be worked until it is put out or dies a natural death.

THE GRAND ANTIDOTE OF THE NINETEENTH CENTURY.—It is impossible to stop the progress of the causes that produce disease. The only thing that can be done to check the march of sickness is to meet or forestall the disorders of the human family with competent antidotes. Among these counterblasts to physical infirmities, the PLANTATION BITTERS take the lead. This supreme tonic and alterative has no larger sale than any other proprietary medicine in the world, and the record of its beneficent effects is the most voluminous one that has ever attested the value of a medicine. Go where you will, you find enthusiastic praise of the preparation on the lips of every man and woman who has ever resorted to it as a tonic and alterative, and with an annual sale of five millions of bottles it may well be imagined that the good it does is almost limitless. ***

Weekly Shareholders' Directory, for Meetings, Assessments and Dividends.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

BEET ROOT SUGAR.—The question of producing beet root sugar in this State is gradually increasing in interest, and we are pleased to note that an important experiment bas been made by Mr. Justus Beplar, of San Mateo County, to ascertain, definitely, the capacities of the soil and climate of Californuia for this valuable product. Mr. B. bas prodnced a sample of sugar pronounced to be equal to the best brands of imported cane sugar. It is well granulated, pure, and presents a thoroughly marketable appearance. Tbis experiment is considered one of much importauce and significance. Some idea of the value to wbich this interest may attain on this coast may be inferred from the fact that the sales of sugar by our local refineries for the quarter ending March 31st, amounted to an aggregate value of $748,593; or witbin a fraction of three millions a year. It is now pretty well settled that tbe Sacramento beet sugar factory will go into operation during the cnrrent year, and the company will be prepared to purchase all the beets which may be produced the present season. There can be little donbt that within a few years beet sugar will form an important item in the already long list of California productions. It may be interestiug in tbis connection.

THE FLAG FOR THE STATE CAPITOL.—It has alrcady been auuounced that the next legislature is to meet in the new capitol building, in Sacramento, and that the first assembling of tbat body there will be announced by tbe raising of a national flag, made exclusively of California silk. Mr. Newman, the pioneer silk manufactnrer in this State, has recently purchased the cocoons from which this flag is to be made. They were produced in Santa Barbara County.

HAVE you tried Muller's Brazilian Pebble Spectacles? undoubtedly the best in use; 205 Montgomery street, Russ Block. *

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

The Pennsylvania.—*Chronicle*, April 24: This week an increased force has been drifting north and south, and on both sides of the ledge, which has been laid bare between 40 and 50 feet. A quantity of the ore has been worked at a Nevada mill with satisfactory results. Their poorest ore, with a mill at the mine, will pay a profit of from $8 to $10 a ton.

The agent of the Schenectady (Tarshish) Company from New York, will arrive in Alpine soon, after a quantity of the Tarshish ore, lately sent to San Francisco, has been worked by the Paul process. We may now look for an early resumption of work in this valuable mine. It is probable that the company will erect a mill during the coming Summer.

Globe.—*Miner*, April 24th: This tunnel has a softer substance in the face than ever before, with quartz all through it, and some ore visible; all good symptoms.

BUTTE COUNTY.

Oroville *Record*, May 1st: The Merrimac Mill, at Swede's Flat, has been running during the month with good success. There has been no trouble in getting ore enough to keep a ten-stamp mill running night and day. They have been prospecting one of their ledges by sinking shafts. In doing so they have struck a chimney of rich paying rock.

MARIPOSA COUNTY.

The Mariposa Company.—*Mail*, April 30th: The company some time since contracted for 500 cords of wood at their mill in Mariposa, which is now being delivered rapidly. The pump will immediately be set in motion, and probably in five or six days, a gang of men will commence taking out rock.

NEVADA COUNTY.

Red Diamond.—*Transcipt*, April 27th: The owners intend to fit up a hydraulic power on their claim immediately. They have thoroughly prospected through their tunnel and drift, and at the last clean up declared a dividend. The gravel prospects first rate, and they can do the work more rapidly by washing off the surface, and afterwards running an open cut.

Paying Big.—We understand the quartz ledge, owned by Joseph Perrin and others, a short distance from Forest Springs, is paying big.

You Bet.—We are informed that there is not likely to be an effort to rebuild You Bet on the present site, and the gravel, which is thought to be valuable, will probably be washed off.

New Ditch.—*Transcript*, 30th: County Surveyor Bradley yesterday completed the survey of a ditch ten miles long, which, when built, will carry water from the Cascade ditch to the Pittsburg mine.

Another Strike.—*Gazette*, 27th: Some 25 or 30 miners employed by the Banner Co. refused yesterday to work with the single-hand drill, to use the giant powder, and were discharged. These, with those who left last week, make over 60 who have thrown up their situations rather than drill holes for blasting with giant powder. The owners are determined to work the mine in their own way.

Idaho.—Same 29th: This splendid mine keeps up its yield of the precious metal, and on Monday morning shipped $15,000, the result of two weeks crushing, with 15 stamps.

North San Juan.—Letter of the 28th to same: The miners up and down this ridge, from the township line on the East to French Corral on the West, are doing remarkably well. The mines at Sweetland, Sebastopol and Buckeye Hill particularly, are remunerating their owners with heavy dividends. At Kate Hayes and Empire Flats the miners are coining money, and if the supply of water holds out, there will, in my opinion, be more gold extracted in this township this season than there has been in any one season since the mines were opened. Water, cheap and plenty is what is now desired. Evans & Co., at Buckeye, are using 700 inches daily, but want 1,100 and can't get it.

Wm. Penn.—Same of May 3d: We are informed by Alex. Stoddard, President of the Co., that they are vigorously prosecuting the work. During last month they sunk 50 feet on the ledge and took out 55 tons of rock of good quality.

Allison Ranch.—Grass Valley *National*, April 29th: The water in this mine is being rapidly reduced. Both pumps are kept going day and night, and lower the water at the rate of about 25 feet per day. Fifteen days more will suffice to pump it dry.

Wisconsin Mine.—Same of 30th: Work is being energetically prosecuted. They are now taking out some very rich rock on the 300-foot level. The ledge is two feet thick and looks well. The rock, it is estimated, will run $75 per ton.

The Grass Valley *Union*, of May 2d, describes a test trial of the giant powder made at the Empire mine in the presence of several mining superintendents. A ¾-inch hole 26 inches deep was drilled, charged and fired in 90 minutes. The effect was greater than with the "black" powder. The conclusion reached by those present was decidedly in favor of the "giant."

The timbers in both the old and new shafts of the Allison are found to be perfectly sound, the water having preserved them efficiently.

PLUMAS COUNTY.

Meadow Valley.—Correspondence of Quincy *National*, April 24th: "Near the Tollgate, Robinson & Hunt, Edmonds & Co., and Nelson & Co. have started to pipe. On Clear Creek, Smith & Nelson have been working all winter, opening a claim, and have got some good prospects. On the main Meadow Valley Creek, four companies are at work, and some of them are doing very well. Jack Hanson & Bossel have also made good wages there. They are piping on the right bank of the creek, at the head of the valley. On Spanish Creek, Grace, Douglas & Co. have been busy at work for some time on Green Flat, and on the opposite bank, Warren Stagg and Mumford & Co. are also piping. Doc. Miller and Taylor are reported to have struck it very rich in a ravine, emptying in Silver Creek."

SIERRA COUNTY.

Fir Cap.—Downeville *Messenger*, May 1st: The claim continues to prospect as well as when pay was first struck. The gravel has widened out to about two feet, and is still increasing.

Webe.—A ledge three feet wide has been struck in the Webe tunnel, on the east fork, one mile and a half above town. The rock prospects well.

Ned Leonard has struck his ledge in the lower tunnel, and finds it solid, with casing well defined. The rock prospects equally well with that taken out above.

Alaska Mine.—The continued yield of extraordinarily rich rock enabled the company to declare a dividend on the 15th inst., of one thousand dollars to each tenth share, payable forthwith in coin.

Howland Flat.—The Union claims have again got quite an extensive bed of rich ground....The Monumental is doing well. ....The Pittsburg is also said to be doing well.

SHASTA COUNTY.

Rich Quartz.—*Courier*, May 1st: A Frenchman mining on Dry Creek, near Whiskytown, a few days ago found a piece of detached quartz rock, which, when pounded up, yielded over $200 in gold.

SISKIYOU COUNTY.

Cottonwood.—Yreka *Union*, May 1st: Quite an excitement prevails at Cottonwood over the rich quartz now being taken from their ledge by Meritt, Dewitt, Brown & Co. They are sinking on the ledge, and at every advance find the most encouraging prospects. The ledge is said to be well defined, and to increase in thickness as well as richness as they descend. It is the purpose of the company to erect a mill as soon as practicable.

TRINITY COUNTY.

Brown's Creek.—*Journal*, April 24th: George W. Ward has found some excellent prospects, with plenty of ground.

Weaver Creek.—The flume is working finely. Several men are sluicing on the creek, and considerable work has been done for two hundred yards above the head of the flume.

TUOLUMNE COUNTY.

Golden Rock Ditch.—Sonora *Democrat*, May 1st: Andrew Roca having purchased the interest of John H. Watts and Otis Perrin, in addition to that of Irwin Davis, in the Ditch, will lose no time in bringing the water into the Garrotes and Big Oak Flat. He is now in San Francisco purchasing pipe through which to force water across the gap formerly spanned by the big flume. When this is completed, lively times may again be expected.

ARIZONA.

Big Bug.—Prescott *Miner*, April 10th: Rich specimens are brought in from the Independence lode. At a depth of ten feet the vein is ten feet thick, and in a cut run across it at another point, it is over twelve feet in width. The ore is of the red, honey-comb sort, and very rich....The placer miners at work near the mill, and in the old Mexican Gulch, are making from $5 to $10 per day.

Hassayampa.—The only quartz mining now in this district is upon the Sterling mine. The new Superintendent, Mr. Widman, has taken hold of matters in earnest. There are over 20 men employed. The new batteries and pans are expected to arrive soon....The proprietors of the Chase mine are awaiting the arrival of the new machinery. They have several tons of tailings on hand, which they design working over....Placer mining is being pursued with success. We learn that no miner on the creek is making less than $5 per day. Joseph Young and S. R. Scott are working a high bar that is paying them about $10 a day to the hand. J. B. Slone has a bar that pays him about as well.

Walker's.—Very little is being done. It is rumored that the Accidental Co. will soon start operations.

Bradshaw.—Most of the miners have abandoned the Black Cañon diggings, owing to the high cost of living. Every pound of provisions costs the miners two dollars.

Wickenburg.—The Vulture Mining Co's 20-stamp mill was, at last accounts, turning out bullion rapidly. But a short time ago, Mr. Phelps took with him to California, over $50,000, and James D. Cusenbary, the old superintendent, took in $30,000. Before returning to Arizona, Mr. Cusenbary will probably organize a company to work his own claim on the Vulture. It is believed that another 20-stamp mill will be erected, and 20 stamps more added to the Vulture Co's mill. Many Mexicans are employed by the company. Reese & Krause's mill will not run for several weeks....A party had gone to prospect the big cañon of the Hassayampa, between Wickenburg and Walnut Grove, for placers.

Lower Lynx Creek.—The news is that dirt has been struck in the claims of Jackson, Lovejoy & Co., that will pay $30, and probably $50 a day to the hand. At present, we cannot say more than that it promises to eclipse all hydraulic mines yet discovered. The other claims on the creek are paying well.

Weaver District.—During the past winter, the old diggings known as Weaver Hill and Antelope have yielded well. Pieces as large as an egg are frequently found by Mexicans. The American miners are prospecting the deep bars in Indian and Antelope creeks. Formerly, these creeks were dry for two-thirds of the year, but this year their beds are filled with water.

Pima County.—The Apache Pass Mining Co's quartz mill is ready to work.

Yuma County.—Some Mexicans have found rich diggings up the Gila about seven leagues from Arizona City, and parties are rushing there. The gold is coarse. ....James Spann is working his gold ledge, near Gila City. He is putting up new machinery....The Germans have gone to work with their dry washing machines, and are taking out a great deal of gold....Mr. Butterfield and Jack Hamilton are working a galena mine at Castle Dome, and making it pay well. There is something in the rock that makes every white miner who works there sick. A man died a short time ago, from the effects of the poison ore.

COLORADO.

Terrible.—Georgetown *Miner*, April 15th: The machinery for the tunnel will be here this week. Work will be recommenced at an early day.

Equator.—The owners have purchased a large steam engine for their mine. It will be here in a short time, and be set up as fast as men and money can do it.

Messrs. Jackson & Way have returned from their new El Dorado, west of the Middle Park. Mr. Jackson has prospected all the streams flowing into the Grand from the Rabbit Ear range, and found float gold in all.

Spring.—The trails to the mines are open. Huepeden & Co. have made arrangements for ore to run their mill and cylinders up to their full capacity.

We saw this morning two bricks from Stewart's Works, Georgetown, weighing 453½ and 450 ounces; coin value, $831.82.

Idaho District.—Bennett, Wright & Co. are taking out good pay....Fitzpatrick & Co. commence sluicing this week, with tip-top prospects....Koons, Beazy & Co., half a mile below Masonville, are taking out good pay ...Reader & Co. are preparing to make a big run....The Clear Creek County placers will be working on a large scale this summer.

Gardner Lode.—Central City *Herald*, April 14th: Work is about to begin on Nos. 4 and 5 west. This property has lain idle four or five years.

Shaffer & Co. cleaned up $1,200 gold from three cords of surface quartz from the No. 1 lode. This firm have leased the Holman mill, at Black Hawk—12 stamps.

John Sensendiffer will start up his new mill on North Clear Creek at once.

Bullion Shipment During March.—Of gold dust, $150,665.12, currency value, was shipped, and silver bars to the amount of $6,713.68,—by Clark & Co.

We saw six bars of gold yesterday worth $800 each, the yield of Stanley & Stalkin's mine during one month. In addition these men have sold a large quantity of smelting ore, which brought $100 per ton. One hundred and ninety-three feet of cap was passed through before the rich body of ore was struck.

Clear Creek.—Dennis Favro has been taking in about six ounces of gulch gold per week during the past winter. Last week he took in ten ounces. The creek is in good condition for working. There are 14 companies now at work below Idaho.

Register, 15th: The prospects of the season are good. Mining is brisk, and every mill in order is at work to its utmost capacity. The amount of bullion is large and constantly increasing. Some old mines are shut down to await change in management, but others have been opened, and none are worked which do not yield a profit. The working of the ores is done with much more skill than formerly.

William Lynn, on Gregory No. 2, is down about 20 feet, and has levels started east and west in which his vein of pay ore is two feet in width. None of the ore has yet been reduced, but it prospects well. Several cords of it were yesterday hauled to Terry's mill, Black Hawk.

German Lode—Veto Lode.—An assay of surface rock yesterday gave $124.02 gold, and $28.60 silver, per ton. An average assay of rock from the Veto lode, Gilson Gulch, gave $350.33. Needham & Leighton are opening a promising silver lode, in Virginia Cañon, the surface rock from which yields over $200 per ton. William Hobbs has commenced working his Kangaroo lode, in Boomerang Gulch.

John Shaffer and party have struck a new lode on the hill. At a depth of twelve feet they have a pay vein three feet wide, which yields, under stamps, over $400 per cord. The material is mostly dirt, and easily taken out.

The Bars.—On Illinois Bar, the Schwartz claim is paying nearly an ounce per day to the hand. A patch of bedrock 4x5 feet, last week yielded eleven ounces. Mead & Co. are working a portion of this claim on shares, and doing well. Cooken & Co's claim, on Grass Valley Bar, is yielding six to eight dwts. per day to the hand. Bouzie & Co. have struck some rich diggings near Masonville, and Tirrell, Porter & Co. are reported as having found some rich diggings below Haines' Bar. The claim of Wright, Clenfield & Benuett is turning out its ounce a day to the hand.

The Mills on Lake Gulch—Russell Gulch.—Brastow's and Cheney's mills now have all the custom ore that they can crush. The Unexpected lode, above the Brastow mill, is furnishing a large amount. Two cords recently cleaned up 29 ounces. Mr. Perrin is hauling ore from the Pewahic, which yields seven ounces per cord. Mr. Reed is working the Delaware lode, near the head of Russell Gulch, and from a depth of about 370 feet is raising some rich looking ore. George Mitchell's 12-stamper in Leavenworth Gulch, is pounding away steadily, two batteries on Illinois ore and two on custom ore, mostly surface rock.

Boulder correspondence of Denver *News*, April 14th: "All join in predicting a busy summer in Jim Creek, Ward district, and in the vicinity of the great Hoosier lode. All the available stamp mills and arastras will be put to work. Of the latter, a number of new ones are to be erected. Mr. Thompson is mining on the Stoughton lode, and selling his ore to Prof. Hill, at Black Hawk. The transportation costs $37.50 per ton, and when the cost of mining is added, the total is not far from $50. He receives $160 per ton, leaving him a profit of about $100 per ton."

Proposed Smelting Works at Denver.—Messrs. Charles Halleck and L. J. Weber offer to agree with the citizens of Denver, to erect and have completed for operation in July, smelting works, consisting of a brick building 60x80 feet, with fire-proof roof, brick stack, at least 50 feet high, and of sufficient dimensions to attach six or eight furnaces, viz., two smelting, one roasting, and one cupel or refining furnace. In consideration of the above, they ask as a donation, from the citizens of Denver $7,000, one-half in cash, and one-half in real estate or merchandise, at a cash valuation. Other propositions of the kind have been made. The Denver *Tribune* says smelting is required in Denver, and that the best men of the town will support a subscription.

MONTANA.

Grizzly Gulch.—*Helena Post*, April 16th:

The upper district yields still its thousands, and work has commenced in earnest. The water only permits half a day's working at present. More pay dirt has been taken out this winter than during any previous, and huge piles of rich prospecting gravel are being hauled to the gulch.

BRICK.—The result of a two weeks' run of the L. X. L. Mill at Unionville was 240 oz.; coin value $4,037.

BANNACK.—Everything is activity. A large force is cleaning out the big ditch. Claims are being fixed up, sluice boxes put down, drain ditches made, and everything necessary to a vigorous season of mining.

GERMAN GULCH.—Lumber is piled up all along the gulch, and carpenters are making boxes. Edwards & Co. have laid a few hundred feet of flume, and the Eureka Company nearly as much. The big ditch is completed, all but some fluming and the finishing.

SILVER STAR.—A run of five days on the ore from the Iron Rod, by the Stevens & Trevitt mill, yielded about $5,000. The Green Campbell mill is running day and night on the richest ore the mine has ever produced. Preparations are being made to erect three other mills. The Queen City lode is opening richly. This district has been thoroughly prospected the past winter, and a number of rich lodes developed.

UNIONVILLE.—None of the companies have stopped work. A sufficient force will be employed to take out quartz to keep the mills running.

NEW DIGGINGS.—A party prospecting in a side gulch four miles beyond Georgetown, on Thursday, sluiced out $19 in a three hours' run with one box, after reaching bed-rock. A dozen friends were quietly informed, organized a district, staked off the gulch, and prepared to commence work. Bed-rock is from 6 to 10 feet, and there is about 25 inches of water in the gulch. It has been named "Specimen Gulch."

VIRGINIA CITY.—A new lode has been struck in Silver Belt District, the crevice of which averages from twelve to fourteen feet, and increases as they go down. It is said to be very rich.

DEER LODGE ITEMS—FRENCH GULCH.—The hydraulic claim on the bar is being put up in shape. There are about seventy-five men employed in this gulch, and at least three hundred men can find work during the summer. There is plenty of water anticipated. In Bear Gulch every claim is being worked, miners are washing up their dump piles, money is plenty and the prospects flattering. A new ditch has been completed to supply Antelope Gulch. The mines are said to be rich. A very rich body of quartz has been struck in the Caleh lead, which will keep the mill busy when it once starts.

MEXICO.

Papers per steamer *Montana*, bring the following news:—The Tajo mine in Rosario was siezed by bandits, and a *prestimo* of $3,000 demanded. Mr. Bradbury and his men were entrenched in their own house. Subsequently assistance arrived from Mazatlan, and the robbers fled. The troops mistook Bradbury's party for robbers, and they were fired upon, killing Julius Overkott, the mining manager.

NEVADA.

HUMBOLDT.

BATTLE MOUNTAIN.—*Register*, April 21st: Brown & Cain are pushing ahead with their contract on the St. Helena. The ledge is four feet wide, all solid ore in the shaft, which is 50 feet deep. Work is also prosecuted steadily on the Montrose, and the shaft is now 50 feet deep, in which is a vein of ore five feet wide, that will mill from $75 to $100 per ton. The Little Giant mill is running on ore that yields from $250 to $300 per ton. A San Francisco company will commence work immediately. The Alaska is a large, well-defined lode.

ECHO DISTRICT.—Developments on the Alpha mine are of the most favorable character. Carmony & Smith are vigorously prosecuting work on the mine.

The drift on the lower level, 160 feet from the surface, discloses the largest well-defined vein yet developed in Humboldt County, it being at that depth 20 feet wide. The ore is principally of the black sulphuret variety, and a few tons of it recently worked in San Francisco yielded $575 per ton. A lot of 140 tons is now being shipped to the English mill, on the Truckee, for reduction. Dorman & Co., owners of the north extension, are sinking a shaft, and at a depth of 30 feet have a vein five feet wide. Sanches & Kaughman are at work on the south extension, and have ore in paying quantities. The district is being thoroughly prospected.

PLACER MINING.—Dick Nash and J. Miller, of Star, have struck surface diggings a short distance above the Sheba mill, on Star Creek. Prospects averaging five cents to the pan have been obtained. Several claims have been located on the creek, and sluice boxes are in demand in that vicinity.

Joseph Organ has put the Sheba mine in working order, and will commence taking out ore in a few days. Six men have been at work on the mine for the last four weeks, cleaning out old shafts and drifts, and setting things generally to rights.

BULLION Silver Mining Co. shipped this week 2,987 ounces of bullion....Fall & Co., 3,987 ounces....G. Negus, shipped April 22d, 137 pounds of bullion from Golconda.

THE AUBURN MILL ON THE TRUCKEE.—Reno *Crescent*, May 1st: This property, adjoining Reno, is owned by an English Co., known as the Nevada Land and Mining Co., limited. The mill, which is of 20 stamps, with a complement of pans and settlers, was completed in 1856, the calculation then being to work ores from mines in the neighborhood until the completion of the railroad to Humboldt, where the company own some extensive mines, containing valuable ore. On making a trial it was found the ores here would not pay and the mill shut down. Last September Mr. J. J. Dunne arrived here from London, and at once commenced putting the works in order. Very extensive repairs have been made, including the cleaning of the ditch from end to end, and the digging of a new tail-race seven miles in length. The mill power is one of the very best on the coast. The mill started up on Tuesday on ore from the Alpha mine. Mr. Dunne contemplates the erection of roasting furnaces to work the richer grades of Humboldt ore, which are now being shipped to Swansea.

This company own an extensive body of land surrounding the mill, 800 acres of which is under fence. This enterprise was started in 1863, and upwards of $600,000 has been expended.

REESE RIVER.

SILVER BEND.—Austin *Reveille*, April 27th: We learn to-day that W. F. Leon, of the El Dorado South mine, was appointed agent of the Belmont Co. in that district by Col. Buel before his departure to Europe. Mr. Leon has already resumed work in the Transylvania mine of the Co., and is repairing the mill for immediate work. There is a large amount of good ore at the surface of the Transylvania mine ready for the mill; and upon the grounds of the latter there are 150 tons of concentrated tailings which will yield, as shown by repeated assays, upwards of $150 per ton. As soon as the requisite hands can be obtained from White Pine, it is Mr. Leon's intention to work the El Dorado North.

BULLION.—Mr. Curtis, Supt. of the Manhattan Co. to-day completed his shipment for the steamer of the 30th, amounting to 47 bars, weighing 4,033 pounds, and valued $60,125 42. This is the second shipment by that Co. this month.

AMERICAN.—Same of 28th: It was reported to-day that this Co., which has sunk a shaft on the claim known as the Yankee Blade, in the cañon of that name, had cut the vein in the shaft. Workings of this mine developed large bodies of valuable ore, and the report is likely to be true. If it is, the Yankee Blade will soon largely increase the product of the district.

LANDER HILL ORE.—The Harding and Dickman mine, which has been unworked for years, until recently, has been celebrated for yielding rich ore. We learned to-day that some 16 tons were reduced at the Manhattan mill, the assay of which exceeded $800 per ton. Several other mines in the hill are also producing ore of a high grade.

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

SIERRA NEVADA.—*Enterprise*, April 27th: The body of paying ore in this mine appears to be absolutely unlimited. How Mr. Williams, Bob Apple and other superintendents, who have had charge of the mine, came to overlook this immense body of ore on the very surface passes our understanding.

OCCIDENTAL.—Same of 28th: This mine never looked better. Good ore abounds in every part. On the lower level sulphuret ore, similar to that of the Comstock, has been found. Its extent is not known as no cross-drifts have yet been made on it.

GOULD & CURRY.—Work in the bottom of this shaft, with a view to the opening of a new level, will be resumed within a day or two.

ENCOURAGING.—29th: The mines along the whole Comstock ledge are looking well, and our prospects for a prosperous season are most encouraging. Some mills are still idle on account of the stoppage of the mines at the Hill, but we hope soon to see them all going as usual.

OVERMAN.—May 1st: The Co. are retimbering their main shaft. They timber one compartment at a time, so that the hoisting of ore proceeds as usual. The works are in excellent order, and everything looks favorable. The ore taken out is not of a high grade, yet pays well for milling. Most of the ore is being taken out through the Uncle Sam shaft.

BULLION SHIPMENT.—During the past week 7,058 pounds of silver bars, worth $185,563 47, was shipped from this city.

OPHIR.—The drift west is now in 238 feet. Some seams of clay have been cut, and some small pockets of water tapped, but the water has in every instance drained off in a few hours. It is supposed that the drift is still a considerable distance from the front lead.

AMERICAN.—May 3d: Operations are being resumed on mines that a year or two since were in a manner abandoned. Then it cost $30 per ton for reduction; now $8 to $10. In the above named mine,—the old North American,—they are now working through a tunnel 350 feet in length, which cuts the vein at about 100 feet below the surface. Here the lead is 50 feet in width, and an opening north and south has been made on it for a distance of 120 feet. There is but little waste in this whole body of quartz, and as taken out, it averages $16 per ton when milled. The mine is immediately south of the Overman, and the underground works of the two are connected. Four mills crush the following number of tons, each, per day: Devil's Gate mill, 85; Atlanta, 15; Ramsdell and Smith mills, 12. The mine is now so well opened that 200 tons per day might easily be taken out. A new boiler is being put in at the hoisting works, and operations will shortly be resumed in the old shaft.

ADRIATIC.—This Co. is taking out a large amount of good ore. Crushing will commence next Monday at the old DeLand mill. The breast of ore in the mine is 10 feet in width. The ore shows much free gold.

HALE & NORCROSS.—Large quantities of high grade ore are at present taken from the lowest level of this mine, some of it averaging $125 per ton. The whole mine yields at the rate of over 1,100 tons of ore per week, averaging $60 per ton.

THE DAMAGED MINES.—Gold Hill *News*, April 30th: The air in the Crown Point is only bad in the upper levels. The water is now reduced by the pump to less than 70 feet. They are to-day clearing up and hoisting out caved waste. Some ore is being hoisted from the 800-foot level of the Yellow Jacket, and the Kentuck continues yielding ore from its upper levels.

Same of May 1st:—The Yellow Jacket and Kentuck are sending out ore at a lively rate. Ore could have been sent out from below the 700-foot level of the Crown Point to-day but for repairs found necessary to the machinery. They are retimbering the 700-feet station which was burnt out and caved. The fire in the mine is thought to be extinguished.

Same of the 3d:—Yesterday 20 or 30 car loads of ore were hoisted from the 800 and 900-foot levels of the Crown Point, and the prospect was that full operations would be proceeded with, but an increase of smoke was noticeable towards dark, and by 10 o'clock in the evening it had become so bad in the upper levels that all hands were taken out of both the Crown Point and Kentuck mines. The smoke and gas increasing about 11 A. M. to-day, both the Crown Point and Kentuck shafts were closed, and steam will probably be sent down to extinguish the fire if possible. It is burning between the 700 and 600-foot levels. Only a few men are working in the Yellow Jacket to-day.

WHITE PINE.

[The latest items of news and information from this district will be found on another page.]

OREGON.

MINING ENTERPRISE.—Portland *Oregonian*, April 24th: Mr. Henry Nevison will leave next Friday for Sutherland Bar, on the Upper Columbia, near Fort Okanagan, with a number of Chinese for Tong Duck Chung, who, if prospects prove favorable, will buy out all the white owners, and employ a large force of Chinamen to work the mines.

Sentinel, 24th:—Mr. Neuber has two bars of gold weighing 18½ ounces, which he melted out of 58 pounds of rock from the shaft of Dillon & Bowden. This was from selected rock, taken out at the depth of fifty feet.

SEVEN hundred millions of dollars have so far been lost in British railways by mismanagement.

Resources and Developments.

GRAIN ELEVATORS.—The importance of the introduction of grain elevators, into this State, can scarcely be over estimated. Our wheat is now handled in a manner most slow and costly. How much can be saved by the proposed improvement, it is impossible to say; but the aggregate must be very large on the entire crop of wheat and barley—not less than half a million of dollars, annually. This is for *handling*, alone; but the use of elevators would also do away with the use of sacks, which are now a farther tax of at least two millions more. Of course, *handling* in bulk would also imply *shipping* in bulk, which several careful grain shippers have pronounced perfectly feasible, for even a Cape Horn voyage. Should such a system be adopted, adopted, the two elevators now projected here and the one nearly ready for operation at Vallejo could handle but a small portion of the California grain crop. In Chicago, eighteen elevators are employed to handle only 10,000,000 bushels—less than one third of our present crop. The use of elevators and shipping in bulk will save the grower from eight to ten per cent. in the cost of getting his wheat to an Eastern market—a very handsome profit of itself, on a large farm.

FARMING LANDS.—One of the most important items in the progress of the material development of the State, at the present time, is the determination manifested in the agricultural counties, to tax the land on mammoth ranches at something like its market value; thus rendering it to the interest of the holders of such lands to transfer them to those who, by putting them to immediate use, can afford to pay the taxes. There is moreover a very active movement in Government lands, over 240,000 acres of which were sold at the land office in Visalia, alone, during the month of March. An Association, known as the Celtic Farm Association, has also recently been organized in this city for purchasing large tracts of government or private land, to be divided up into farms, each alternate subdivision of which is to be sold at a low rate, but only to persons who will occupy the same and engage personally in agricultural pursuits. We presume that one of the objects of this association is to save to purchasers of homesteads the enormous profits which middle men and speculators are making out of these homestead operations, and thereby divide all the advantages among themselves. The homestead device, in the hands of avaricious men, is fast becoming a delusion and a snare. Such associations as the one here indicated may serve a good end in preventing such a result.

FISHERIES.—There are but few persons who are aware of the large proportions which the fisheries are assuming on this coast. The gross receipts for the present year, of the three principal firms on the Columbia river who are engaged in canning salmon, will reach, if not exceed, $300,000. In addition to the canning business, there are also numerous parties who are pickling and packing in wooden packages. Extensive fisheries of various kinds are also established and being established on Puget Sound and its tributaries, where almost every variety of fish is found that swims in either fresh or salt water.

The cod fishery of the northern coast has already become a large and lucrative business. The advantages of this coast for this important industry are nowhere excelled. The fish are very plenty, and of a superior quality, while the fishing grounds are almost unlimited in extent, and the water not more than half the depth of that on the New Foundland banks—an advantage which any fisherman well knows how to appreciate. Fishing is a peculiar and distinct branch of commerce, which requires, in order to ensure success, men of experience and means, and a fine opportunity is here presented for such men to embark in the business.

TRADE WITH ALASKA.—Within the past year our coast traffic has taken a huge stride to the northward, compassing at a single bound, the whole northwest coast of America. Trade with the various ports and islands of Alaska is being steadily developed. Since the first of January over thirty vessels, with an aggregate of about 7,000 tons, have been fitted out from this port, for our new possessions. Eight of these vessels were dispatched during the month of March, all carrying cargoes of assorted merchandize.

Mr. A. C. KNOX, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1868.

San Francisco:
Saturday Morning, May 8, 1869.

Notices to Correspondents.

COLUMBIA, Tuolumne County.—The best Parian marble is white, very slightly inclined to yellow, with a waxy lustre. It is fine and granular, and if well polished, presents a subdued varnished appearance. It is particularly celebrated for withstanding the decomposing effects arising from atmospheric influences. The name is derived from the isle of Paros, where it is obtained. Parian marble was highly prized by the first Grecian sculptors on account of its adaptability of accurately receiving the finest designs and most delicate touches of the chisel, and retaining for ages the rich mild lustre of the original polish. The finest specimens of Greek sculpture remaining to the present time consist of Parian marble, for example, Venus di Medicis, the Diana Venatrix, the collosal Minerva (called *Pallas of Velletri)*, Ariadne (called *Cleopatra)*, and Juno (called *Capitolana)*.

PAINTER, CALAVERAS CO.—The great bulk of natural mineral paints consists of oxides of iron mixed with various proportions of alumina and silica; by far the greater part consisting of what are usually known under the name of ochre. These are usually of a dull yellow color, which, when heated, changes to red, or as it is sometimes called, "colcothar" color. Spanish Brown and Venetian reds are the commonest varieties of torrified ochres.

NUMISMATIST.—If the metallic circulating medium of Great Britain is the one to which you allude, we believe that it amounts to about $670,000,000, of which $400,000,000 is in gold coin. With what is called the copper coinage—pence, halfpence and farthing—the sum is about $5,000,000. Although called copper money, the last named is really formed of bronze, *i. e.*, tin and copper alloyed, forming the most durable small currency to be found in the world.

STRATAGRAPHIST, Knight's Ferry.—The description of rocks of varied classes can easily be exhibited by employing dots and lines in varied angles and arrangements,—as well as by coloring, though this method is not so pleasing to the eye.

THE CHIEF CLERK.—We learn by telegram that Mr. James Grinnell will be retained in his present situation as Chief Clerk of the Patent Office. From our acquaintance with Mr. G. and his antecedents, we are confident this is a wise confirmation by the new Commissioner. Mr. Grinnell is a native of Hampshire county, Mass., and hails from the mountains contiguous to the poetic-famed Berkshire Hills—where they raise men of robust mein and vigorous mind.

CONTINENTAL Life Insurance Company, 203 Montgomery street, corner of Pine.

Permanent Interests in Mining Sections.

A mining correspondent has furnished, in another column, some excellent hints, looking to a more permanent development of the various mining sections of the State—particularly those in and just above the foot-hills. The future of our mining towns is a problem which has elicited much serious thought on the part, not only of the citizens of those towns themselves, but of all who have the general welfare and prosperity of the State at heart. To those who have properly considered the question, no sufficient reason can be seen why indications of decay should be so often witnessed there; for the experience of the past few years has fully proved that the spurs and intermediate depressions of the Sierra Nevada, possess other resources than their placers of gold. Our mountain soil, even in the absence of irrigation, has been found prolific beyond expectation, in the growth of fruit, vegetables and cereals.

Go where we may, into any of the markets of the State, where the vegetables and fruits of the mountains are exposed for sale side by side with similar productions of the river bottoms, and everywhere it will be observed that the former commands the readiest sale and the largest price. The meat or pulp of the mountain fruit or vegetable is the firmer, more palatable and less liable to decay of the two. All the small grains are also produced abundantly, and of the very best quality in the red soil of the hills—especially is this true of wheat, as the products of the numerous flouring mills in the mountains abundantly prove. The vine, as every one knows, has its peculiar and most appropriate home on the hill-sides. California presents no exception to the general rule. We make no mention of the superior inducements which many of our mountain valleys present for the dairy business or for sheep-raising.

Valleys of greater or less extent are scattered all through the mines, as well as greatly-sloping hill-sides, as fertile as the banks of the Sacramento or the San Joaquin; and men who have become tired of mining, and of the roaming to and fro consequent upon that pursuit, are anxious to settle down upon these desirable localities, and make for themselves and their families a permanent home. But there is a serious draw-back to any such attempt, which is alluded to by the correspondent aforesaid, and of which all dwellers in the mountains are well aware. This difficulty grows out of the unnatural hostility which exists between the mining and farming interests, and we know of no better plan for removing it than a sale of the lands by the government—all the lands, both mineral and agricultural, so that the farmer can make his own chosen use of them, without disturbance from any quarter. Such a policy would in nowise interfere with legitimate prospecting, as any land holder would cheerfully grant permits for prospecting which would lead to the development of his property, and on terms which would be mutually advantageous.

We are pleased to note the fact, in this connection, that such opinions are now very generally prevalent among miners in all sections of this and adjoining States, and it is only by carrying out this policy that we can have any reasonable hope for the permanency of our mining towns. The advantage of a mixed system of mining and agriculture in reducing the cost of living and all its attendant benefits, is too apparent to need any argument. With a sale of the mineral lands in small parcels, as suggested in our issue of the 10th ult., our mountain population will become more thrifty and permanent in character, and will greatly improve in its moral element from the more general introduction of families. We may safely assert that nothing can contribute so much towards socializing and permanently improving the pecuniary and industrial condition of the mines as a large introduction of the farming interest. Who does not rejoice to meet, when traveling in the mountains, with one of those cosy little spots, nicely enclosed, planted with vines, trees and vegetables, beautified with flowers, and made alive with rosy, rollicking children. Such people, as a class, do not rapidly grow rich; neither are they particularly anxious for riches. They are content with humble independence and form the genuine substratum upon which the most permanent and most prospersous communities are built. Our mountain valleys should be full of such nurserics of industry and population.

There is no mountain territory on the globe more admirably fitted, by nature, for the fixed abode of humanity, than are the mineral regions of California. If the Swiss peasants can live and thrive and make their lands worth a thousand dollars an acre and more, on the wintery slope of the Alps, so steep that many of the hill sides have to be terraced for cultivation, why cannot the Anglo Saxon do as much or more in the equally beautiful and milder valleys of the Sierra Nevada, where nearly the entire season of winter can be devoted with more or less profit to prospecting and mining? With the growing knowledge of the worth of our hill-sides and mountain valleys for horticultural, pomological, cereal and grazing purposes, and with an adequate protection to that class of industry, we have faith to believe that a new era is dawning upon our mining towns; and we grow hopeful and confident that the mineral regions of this State in particular, will ultimately be as equally blest and flourishing as any portion of our territory east or west.

THE CHEMISTRY OF IRON PAN AMALGAMATION is receiving so much attention from the more intelligent of our millmen that the mystery thereof is no longer in character with the times. Drug-store processes are not all extinct, but the matter is pretty well understood that if any chemical, that may be added possesses virtues in amalgamation, it is because there is a good and simple reason for the same. Experiment suggested by the analogical faculty, and accident, develop new processes; science follows, seeks out and discovers the reason why, and thereby generalizes and facilitates its proper and economical application. While such differences of opinion still exist in regard to the actual chemistry of the patio process, the part played and actual successive charges undergone by that which we put in as sulphate of copper in the iron pan amalgamation; while we rest uncertain whether much or little is really due to friction electricity, in the grinding-amalgamating pans, it must be conceded that we have yet some steps to make towards clearness, and certainty at least, in our understanding of the principles we are employing with such marked success in given cases, and such signal failure in others.

TREATISE ON EARTHQUAKES.—On Monday next will be published at this office, a work by Prof. T. Rowlandson, under the title of "Earthquake Dynamics and Palliatives." The work in question will contain, not only much matter that is not generally known, but views that will be novel even to those who have paid some attention to this branch of physics. We may mention that the novel theories broached have been derived, in part, from a study of the phenomena associated with metallic veins. The work will be noticed in our ensuing number.

In order to accommodate those living at a distance from bookstores, copies will be transmited by mail, free of postage, to any address on the receipt of 50 cents, by Dewey & Co.

ANOTHER Lower California exploring and speculating expedition this week in the schooner Mary Harrison.

The Railroad Jubilee.

The last rail that is to connect the Atlantic with the Pacific will most probably be laid this (Saturday) morning. Our readers are already aware of the elegant and costly shape which has been given to the last tie—a magnificent piece of polished laurel; while the last spike which will be employed has been made of pure California gold, to be driven down by a 4-pound sledge of Washoe Silver. When that sledge descends to made its last stroke, telegraphic wires will be so arranged that the blow will send a spark East and West, wherever the wires may reach. It has been arranged that this spark shall fire signal guns in this city, Sacramento, Stockton, Chicago and other eastern cities, at the same instant. The gun, in this city, will be fired at Fort Point, and will be the signal for national salutes from Forts Alcatraz, Black Point, Fort Point, and Clay street Hill. At the same instant a band of 200 pieces will strike up "Hail Columbia," and with a universal display of flags, all the steam whistles in the city will pour forth a screaching chorus to the national anthem. Other cities throughout the State, and no doubt throughout the Atlantic States, will make similar arrangements to herald the finishing stroke of this, the grandest work which the world has ever witnessed.

Extensive arrangements have been made in this city and Sacramento for the celebration of the day in a manner commensurate with the importance of the occasion. Business will be suspended and our citizens and civic bodies, the military and firemen, will turn out in a procession which, it is confidently expected, will be the largest and most imposing ever wituessed on the Pacific Coast. After countor-marching through the principal streets the procession will move to the Mechanics' Pavilion, where an address and poem will be delivered, to be followed, perhaps, by other exercises of a literary character. A general illumination will take place in the evening, and bonfires will blaze from all the prominent hill tops in the vicinity of San Francisco.

The day will be a happy and a glorious one for California, and one, in the rejoicings of which, the whole civilized world will heartily unite. It will be, too, a proud day for the bold pioneers, who dared, in earnest, to undertake a work, over which all others had been talking for more than a decade. These men had faith in the work and faith in themselves that they could accomplish the work, and upon that faith the road has been built. When men of scientific professions and those that were possessed of wealth laughed at them, they pushed forward with all the more energy and zeal. They have conquered; and now comes the day of their rejoicing. We fully agree with our Sacramento cotemporary—"Let an iron monument be raised to their memory; let the names of those noble, indefatigable men of Sacramento, who carried the work to a successful termination, be inscribed thereon in letters of iron; let us have something to commemorate the event, which will endure until ourselves and our children shall be no more."

P. S.—Since writing the above, a telegram from the front states that it will be impossible to proceed with the ceremonies of laying the last rail to-day. The celebration, however, will be held in this city to-day.

THE "Last Spike" was manufactured at the metal-working establishment of W. T. Garratt, in this city, and consists of $360, U. S. coin, San Francisco Mint, melted together. The work was done by Joseph Garratt, father of W. T. Garratt, and the oldest metal worker, probably, on the coast, who very naturally took pride in doing the job. The finishing and engraving were by Shultz, Fisher & Mokling. A silver spike has also been forged in Virginia City, and sent forward to the front to precede the driving of the last and golden spike. While it was being forged over one hundred persons present, gave each a blow with the sledge.

Metallurgy.

ZINC AND ITS AFFINITIES.—We notice in an eastern exchange that Mr. d'Heureuse is perseveringly at work in New York in testing and perfecting his zinc extraction process,—with which our readers are familiar. The affinities of zinc for lead, quicksilver, and the precious metals, appear to be a popular study with inventors just at present; and for reasons not entirely ill-founded. Flack's modification of the Parks zinc-silver-lead extraction process, is pronounced a success at several establishments, viz., that of Dieffenbach, in Jersey City, and the Deutz Metallurgical Works, near Cologne, on the Rhine. The advantage is, that where lead is a drug, or transportation too high, a small percentage of zinc added will bring both zinc and silver to the surface in an alloy which can be skimmed off. Inquiries concerning the use of zinc in quicksilver, for sluice amalgamation, come to us from practical miners in the foot-hills, in pursuit of knowledge concerning the advantages of an old Mexican process of this character. Zinc-plated iron, for battery and sluice amalgamation, is the subject of a new patent.

There are several methods of separating silver and lead from the zinc. Mr. H. Roux, of Marseillos, has recently patented a liquation process, in which the argentiferous alloy of lead and zinc obtained in the Parks process is broken up, placed into a reverberatory furnace, covered with a small quantity of litharge, and heated to a dark red heat. Litharge is reduced by the zinc, the latter is oxidized; and the lead produced, absorbing all the silver, runs away through an outlet for cupellation. As soon as the running off of the lead ceases, the reaction is complete, and the aperture of the outlet passage is closed. The furnace is then well heated, so as to liquefy perfectly the litharge, as also the oxide of zinc and all foreign matters, such as the oxides of copper, iron, and antimony, which dissolve. The outlet passage is then again opened, and the remaining quantity of lead is run off, the arrival of the litharge in the passage indicating that all the lead has been eliminated. In cases where the argentiferous alloy contains very large proportions of zinc it is advisable to increase the dose of litharge, in order that the latter may be present in sufficient proportion to perfectly dissolve the oxide of zinc, and to form a sufficiently liquid compound to allow the globules of lead to traverse it readily. That portion of the lead remaining in the form of impure lithargo is run off separately. In this country it might be left to lie until reduced transportation would warrant its being made marketable.

AN ASTONISHINGLY "NEW AND CHEAP" PROCESS of extracting gold from quartz is given seriously in the London *Mining Journal* of September 13th—a development of the late Scottish gold discoveries proving the metal to be extensively disseminated in opaque quartzes in that country, especially in Hugh Millor's old quarrying grounds, on the Cromarty coast. "T.," a Newcastle man it appears, is helped to fame in a recommendation of the following:

"First, let the rock be roasted at a red-heat, as is practiced with regard to flints intended for pottery ware. This roasting renders it easy to break the rock afterwards by a hammer into pieces about the size of small apples. In this state the rock must be placed in a large earthenware tube previously fixed in a furnace. The heat in the interior of this tube must be what is called a bright cherry-red, or incipient white heat. If under these conditions we now pass through a current of chlorine gas, either pure or mixed with atmospheric air, as in the making of chloride of lime, the chlorine will combine with and volatilize the whole of the gold existing in the broken rock, and this gold will be carried no further out of the other or open end of the tube than to the part which is at a dull red heat. At this point the whole of the gold will be deposited, for it is a singular fact that although at a white heat, chlorine gas combines with gold and renders it volatile, yet by cooling to a dull red heat the two substances separate and the gold is deposited."

The writer is correct in stating that chloride of gold decomposes at a temperature so high, or low either, as a red heat. As to the affinities for each other of chlorine and gold being restored on attaining a light cherry-red or white heat, (which is improbable)—the resulting chloride of gold being then entirely volatile, we will admit that the latter "fact," especially, and the process, looked at from a practical point of view, have to us the merit of novelty. It seems that the subtle Newcastle chlorine has no difficulty in permeating quartz fragments of apple size. The increased affinity for gold in this new and cheap process is many fold, and wonderful indeed.

Mineralogical and Geological Notices.

FORMATION OF YOSEMITE VALLEY.—Professors Blake and Whitney take opposite views on this subject, the former representing glacial erosion as the cause, and the latter plutonic agencies—a great transverse fracture at the time of the elevation of the Sierra Nevada range, or the "bottom's dropping out," as the phenomenon is popularly accounted for. The points, which may enable tourists to decide the question for themselves, are these: In favor of the glacial origin, the fact that similar valleys, of less depth and rarely such perpendicular walls, are known to have been caused by glaciers in part still existing, aided by subsequent erosion, in the fiords of Alaska and Norway, the Alps and the Himalaya; that the upper end of Yosemite Valley divides into several branches, as a glacier might do; that its bottom is hard granite; that the domes and other summits are distinctly marked with glacial scratches in the general direction of the valley, rounded down by glacial action, and frequently so polished as to gleam like mirrors in the sun. It may be remarked that the ice rivers called glaciers are universally conceded by geologists to have covered immense areas in elevated parts, even down to the tropics, during the "cold snap" which, as we know by these marks and hillocks of debris, happened in the beginning of the post-tertiary age. Ambitious tourists will scale the peaks above the Yosemite, to study the operating causes intelligently by their results. On the Mono Lake trail, at 8,000 feet elevation, scratches are evident from the base to the summits of mountains 2,000 above the valley. We recommend those in search of novelty and the picturesque to go on still further, for on the eastern slope of the Sierra, in this vicinity, are to be seen, not far from Castle Peak, (the sawmills, twenty-five miles N.W. of Mono Lake,) some of the most characteristic work ever done by glaciers on a grand scale,—the results of the ice epoch combined with the picturesque and the sublime, in a succession of limpid, forest-lined trout lakes at the mouths of glacial cañons; and evidently caused by the great natural dams and hills seen stretching across, which are technically the terminal, and lateral moraines, of 100 feet in hight.

In any event, the glaciers of the Sierra Nevada were only local; the north and south scratches of the great northern Drift, over nearly level country, which seems much more difficult to account for than ordinary glaciers, never having been observed on the Pacific side of the Sierra Nevada, nor of the Rocky Mountains, so far as we are aware.

In favor of plutonic, or eruptive origin, it is argued that the walls are too steep to admit of glacial causes; that their sides have inadmissibly peculiar angular forms, the mass of El Capitan, for instance, having two perpendicular surfaces of smooth granite meeting at right angles, and each over 3,000 feet high; that the Domes having been formed by upheaval, no reason can be assigned why a fissure should not have been left at the same time into which the last half of the Half Dome tumbled in "the wreck of matter and the crush of worlds."

DR. HERMAN CREDNER, who has labored very meritoriously, and for years, in the field of American geology, has been appointed—says the New York *Journal of Mining*—as professor at Leipzic University. In his thesis on "the Subdivision of the Eozoic (pre-Silurian) Group of Geological Formations in North America," he defines the lower limit of the Silurian system, describes the Laurentian group of Canada, etc., and the Huronian system, including a northern zone in Canada and Michigan, and finally concludes with an interesting comparison with European formations, and a tabular resumé of the membership and equivalence of the strata. He held in his public disputation "against all comers"—customary on such occasions—that, 1, The granites are sometimes of sedimentary, sometimes of igneous, origin. 2. For many stratified crystalline rocks an original crystalline formation is to be accepted. 3. The theory of the hydro-chemical metamorphosis of extensive rock-formations contradicts natural phenomena, etc. The auriferous slates of the Southern States, designated as "Taconic," are claimed by him to belong to the Huronian series, beneath the lower Silurian. The auriferous slate formation of Central Mexico, of Australia, and the Ural, it will be remembered, are also Silurian.

SINGULAR FACT (?)—The ordinary time of the bearing of the orange, from the buddings, is three years. It is stated as a remarkable fact, that a tree belonging to Mr. G. W. Atwood, near St. Augustine, Florida, recently produced an orange in one year from the bud. This circumstance is thought to be owing to the fact that a fruit instead of a leaf bud was used. If this was the case, it certainly demands the attention of orange growers, and perhaps the growers of other fruit as well.

THE FIRST EMIGRANT TRAIN, from the Missouri River for California, arrived at Grouse Creek, just within the eastern line of the State of Nevada, on the 17th of April. The progress of an emigrant train thus far, so early in the season, betokens an early opening of spring on the plains.

RETURNED.—Dr. J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

Rock Drilling Machine.
Patent for Sale.
The Patent of George C. Phillips, issued Dec. 1, 1868, for a Steam or Compressed Air Rock Drilling Machine is now offered for sale on most reasonable terms. An illustration and full description of this Machine can be seen in the Mining and Scientific Press of March 27, 1869. Weight of Machine for ordinary tunnel work, 75 lbs. It is adjustable so as to drill in any direction; will make from 300 to 500 strokes per minute. One machine will do the work of twenty men.
The inventor guarantees to satisfy any party who will interest themselves in the matter, of the entire practicability of his invention. Address, by express letter,
GEORGE C. PHILLIPS,
19v18-1m Shermantown, Nevada.

Important to Assayers.
Crucibles.
The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.
THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.
CERTIFICATES:
United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. EICKFELDT,
Melter and Refiner, U. S. B. Mint.
Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.
Messrs. A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market. We have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEEO & CO.,
California Brass Works, 125 Front street, San Francisco.
Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adlis, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.
On hand and for sale by the Agents,

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA F. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

Two of the above steamers leave BROADWAY WHARF at 4 o'clock P. M. EVERY DAY (Sundays excepted), one for Sacramento and one for Stockton, those for Sacramento connecting with light-draft steamers for Marysville Colusa, Chico, and Red Bluff.

Office of the Company, northeast corner of Front and Jackson streets.

13v12 **R. M. HARTSHORNE,**
President.

A New Mode of Heating Dwellings.

When we take into account the quantity of heat that is due to the proper combustion of fuel, the amount of labor or its equivalent in moneyed value, which is required by the world to keep itself warm, is enormous. In whatever light we view the great waste of heat, considering its high cost, the loss attending its production is one of the most inexplicable wonders of this age of scientific progress. The disproportion of money and labor to the quantity of heat produced by any device which has heretofore been presented to the world, exhibits a greater lack of economy than does the use of any other natural agent made available by the toil or ingenuity of man.

It is estimated that only about ten per cent of the heat due to any given combustion, has ever been economized; yet volumes have been written upon the subject, and the principal scientific men of the age have given it their most serious attention. Within a few years past coal burning stoves have come into almost universal use for the warming of dwellings, with a manifest degree of economy in cost and care; but with have come poisonous gases, "burnt air," and all the train of evils consequent upon living in dwellings where the pure air of heaven is loaded with the seeds of disease and death. Science has in the meantime been invoked to devise some means by which we might retain our economical gain without submitting to the accompanying sacrifice of health and comfort. To this end, furnaces, radiators, steam-pipes, etc., have been introduced; but all these improvements, while they afford, many of them at least, the desideratum of salubrious atmospheres, have so increased the cost of heating, that but little has been gained over the primitive fire place for wood, or its subsequent modification in the form of the wasteful coal grate. The poor have seemed inevitably doomed to the malarious atmosphere engendered by the demon of "the dark and dirty mine," and the masses have settled down into apathy with a fixed resolution to submit to what could not be helped.

But to the inventor oft-repeated failure is seldom any reason for discouragement—ultimate success is sure to crown well-directed efforts, intelligently applied, and the desideratum which we have been considering, appears now to have been very closely approximated by a happy combination of principles which secures both economy and health. The world is indebted for this new invention to a Mr. Johnson, of Saco, Maine, who proposes to banish from our dwellings all the present heating arrangements, and enable the housewife to warm her apartments or prepare the fire for cooking her dinner in a few moments, by an arrangement which apparently combines the greatest degree of economy yet attained, with the most salubrious atmosphere which science enables us to obtain from a heated surface.

Mr. Johnson's heater consists of an air-tight sheet iron cylinder, with tubes passing through it from top to bottom, open at both ends. The bottom of this cylinder is cup-shaped so as to hold in its center a small quantity of water; while underneath the same is placed a gas jet. The water is put into the cup of the cylinder, which is then closed steam tight. The amount employed is just enough to fill the cylinder with steam, at fifteen pounds (atmospheric pressure). In a small cylinder this would not exceed one or two tablespoonsful. The water is put in when the cylinder is made, and is therefore constant; so that all that is required is to light the gas, when the cylinder is quickly filled with hot steam, which, as fast as condensed by radiation, is returned to the cup to be again converted into steam. By the application of the tubes, a large heating surface is obtained, and the whole arrangement is such as to economize the heat to the utmost extent. An ingenious contrivance self-regulates the admission and exit of air from the cylinder to alternately make room for the steam, and return the air when the condensation of the steam creates a vacuum which is required to be filled. The whole apparatus is as simple and safe as a teakettle. The kind of warmth generated is peculiarly

soft and healthful, while the cost is reduced to a minimum, especially where cheap gas can be obtained.

This invention has been thoroughly tested and fully exhibited in Boston and New York. It appears to have passed successfully through its probationary process, while its important advantages have become fully known to capitalists, who have already organized a company for its manufacture on a large scale, and its general introduction.

One of these useful contrivances has, been brought to this city by Mr. Thomas S. Day, at whose exhibition and sale-rooms, on Pine street, it may be seen and examined by those who desire to do so.

Apropos to the above, we perceive that a company has recently been organized in New York to supply that city with a cheap gas for *heating* as contradistinguished, from *illuminating*. We presume, although we do not know it as a fact, that this company has been organized with a view to more successfully introduce the above invention; as it is well known that such a gas can be manufactured at a cost not to exceed one-fourth that of the ordinary illuminating gas, and which may be distributed to consumers in the usual way.

It may be proper to mention, furthermore, that the new heater can be made in any desirable form, ornamented or otherwise; and that styles have been constructed and exhibited by which all the various processes of cooking can be readily performed. While the writer of this was in New York in January last, the exhibition room of this invention at 511 Broadway, was daily visited by scores and hundreds of persons—scientific men, inventors, hotel-keepers, etc.—who were almost or quite unanimous in the opinion that more has been accomplished by it than has otherwise been obtained in improvements for house warming, if not in cooking, for the last twenty-five years.

The possible development of the simple principle here exemplified is almost unlimited, and if the practical introduction of the invention meets with anything approaching to its promise of success, it must prove exactly what is needed in this city, to take off the edge from our cool evenings and mornings without overheating, and at a cost within the reach of every one. One of the most important considerations connected with its introduction here is the fact that no chimneys are required to carry off the gases produced; as, in ordinary use, they are too small in quantity and too little deleterious to interfere with health or comfort. Naphtha, burned as it is in the lamp manufactured by Mr. Hucks, of this city, or as it is used in any of the petroleum burning stoves, is equally as applicable to the invention as any kind of fixed gas.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

Agricultural.

Cultivation of the Orange.

The cultivation of the orange is becoming quite an important and lucrative business in the southern part of California. In Los Angeles, especially, it has received great attention, and goodly crops of fruit are now being realized from trees which have been raised from seed recently planted in that locality. It has been noticed that the old trees, which are regardsd as partriarchs among those of recent growth, generally produce very sweet, but small oranges; while the newer tress, planted from ths seed of the older onss, yield fruit superior both in bulk and flavor. A very small, young tres produces from 100 oranges in number, upwards; while it is common for the older and thrifty trees to yield from thres to four, and often five thousand oranges, each. There are about 10,000 orange trees in Los Angeles County, which bear, on an average of from one to three thousand each.

The orange is a much more hardy tree than is generally imagined. It may be safely transplanted even at twelve or fifteen years of age. It may be raised from seeds or cuttings, and is well adapted to budding or grafting. The best mode is to graft the sweet, or any desirable variety, on the stock of bitter or indiffsrent fruit-bearing varieties, as the latter are much more hardy. The bitter orange trees flourish luxuriantly in northern Italy, where they are extensively cultivated, in the open air, for the beauty of their foliage and flowers; while the seedling sweet orange, in the same locality, has to be carefully protected by artificial coverings, generally of double glass, during the winter months. A suitable selection of stocks would no doubt render the cultivation of the orange practicable throughout the Sacramento Valley, and in the foot-hills adjoining, although no especial profit could be expected from it in those localities. There are quite a number of very fine, thrifty orange trees growing in a garden a short distance out from the village of Martinez, and a beautiful tree, eighteen feet high, as far up in the foot-hills as Bugbee's Vineyard, several miles above Folsom. Mr. J. R. Ketchum, at Bidwell's Bar, Butte County, has several trees in full bearing, and, if we are rightly informed, several hundred young trees (seedlings) well advanced. One of his trees, a Los Angeles seedling, had 464 oranges upon it during the month on which it reached twelve years of age. This tree has stood the frost, uninjured, down to 21° Fah., with eight inches of snow on the ground. We believe there are numerous other trees growing in various central portions of the State, sufficient to show that the cultivation of the tree, at least for ornament, if not for fruit, is perfectly practicable, as far north as Sacramento.

An orange tree will arrive at full bearing in eight to ten years. The ordinary time of bearing from the bud is three years. In cold climates the tree always has its marked seasons of flowering and fruiting; but in warm climates it is usual for the same tree to contain blossoms and fruit all the way from that just set to that which is ripe; although the fall is the time at which the chief part of the fruit is taken off. In this latitude the regular flowering time for the orange is March and April, and the season for general ripening, November and December.

There is a curious botanical fact connected with this tree, and no other, that ripe fruit can remain on it from one season to another. Such fruit, however, becomes dry and spongy the spring after it has ripened, but falls again with juice at the ripening season. The constant and great fruitage of this tree is very exhaustive to both the tree and the land upon which it grows; it should therefore be plantsd in good soil, and if properly cultivated and dressed will amply repay the outlay in both quality and quantity of its products.

This orange is properly a bush or shrub, and when grown for fruit, should never be trimmed into a tree. The branches should be suffered to spring from the crown of the roots, which is the natural form of growth for the plant. Such a mode of culture will prevent the bark from adhering to the tree, a trouble often met with, especially in dry climates, and one of serious import. A lack of attention in this respect threatens serious disaster to many orange groves in this State. At the present time there is much trouble anticipated from a black incrustation that covers the leaves, and which is thought to proceed from a small insect, which has greatly injured the tree in the Sandwich Islands, and in Florida, within the past few years. This substance is very similar, if not identical with that which is so frequently noticed upon the oleanders in this vicinity.

The botanical name of the common sweet orange is *citrius aurantium*. There are a great number of varieties belonging to the general order, chief among which are the common sweet orange; the blood orange, with reddish fruit, mottled with crimson; the mandarin orange, with a thin rind, which separates spontaneously from the pulp, and which, in China, where it originated, is held in high esteem; the pear-shaped orange; the fingered orange, so called from its frequent peculiarity of growth, wherein an occasional lobe or horn proceeds from an abnormal process of the carpels; the egg orange of Malta; the Seville or bitter orange, already alluded to, etc. The latter named is also subdivided into quite a number of varieties, chiefly cultivated for their flowers and fragrance; some of which are double-flowered. There is also a variety known as the bergamot orange, which has a pear-shaped fruit, and from the flowers and fruit of which the oil of bergamot is procured. The rind of this fruit retains its flavor for a long time, and is often pressed, when green, into the form of small fancy boxes to contain sweetmeats, lozenges, etc. Large numbers of oranges are raised in Florida, and others of the extreme Southern States; still the value of the importation of this fruit is large, exceeding one million of dollars per annum.

An excellent wine has been made from the fermented juice of the sour orange, combined with a large proportion of sugar and water. The pure juice from this fruit is extracted by Orange growers in Florida and sent to Cuba, where it is said to bring a good price. The oil from the peel, rising to the top, whenever the juice is exposed to the atmosphere, preserves the purity of the acid for a long time.

WHAT IS TO BE DONE WITH OUR WHEAT. We have still a large surplus of last year's crop on hand, with a greatly increased crop just coming in. What are we to do with this extraordinary supply? There is no sufficient market for it on this coast; it *must* go abroad—and mostly to either the Atlantic States or to Europe. At the current rats of freights, grain can be transported from this city to New York six cents a bushel cheaper thau it can be carried from Chicago to that city. With this fact in view, why may not a large portion over surplus be transfered to New York as rapidly as tonnage can be obtained for that purpose, and held there justsad of here for a market. Wheat will not advance here until an improvement is noted in New York. Cheaper freights than now obtained will not be found for many years to come, and if it is desirable to hold it, storage will be as cheap or cheaper in New York than here, while the product will, by the transfer, be just where the earliest advautage can be taken of either the American or European markets.

New Mining Advertisements.

Douglas Silver Mining Company.—White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixth (6th) day of May, 1869, an assessment of twelve and one-half cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the eighth (8th) day of June, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-first day of June, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, Room 37 New Merchants' Exchange, California street, San Francisco. my8

Chalk Mountain Blue Gravel Company.—Location of Works: Nevada County, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the fifth (5th) day of April, 1869, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the PRESS from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

Pacific Protective Association of California.

INCORPORATED OCTOBER, 1868.

PROSPECTUS.

OBJECT.—The object of this Association is to secure a cash payment, within sixty days after the death of a subscriber, to his or her heirs or assigns of as many dollars as there are individuals of the class to which said deceased subscriber belonged.

MEMBERSHIP.—The subscription fees are Ten Dollars at joining, and One Dollar on the death of each subscriber. The One Dollar from each subscriber is paid to the heirs or assigns of the deceased.

THE FUNDS.—The By Laws of the Association require that a portion of the money received as subscription fees shall be a Sinking Fund to meet assessments falling due by the delinquencies at subscribers. The balance of the money received to be used for the payment of the expenses incurred by the Association.

MEMBERS.—A subscriber failing to pay his or her assessment of one dollar within Thirty days from receipt of notice forfeits his or her Certificate, and all claims upon the Association, unless good cause is shown for further delay. A subscriber can forward money in advance, which amount will be credited on future assessments. The subscribers are divided into classes including males and females Each class is limited to 5,000 subscribers. As classes are filled, new ones will be formed. No person is so poor that he cannot pay Ten Dollars at joining and One Dollar occasionally, thus securing $5,000 to his or her heirs or assigns.

ADVANTAGES.—The advantages of this Association are, that no *money panic* can affect it. Its benefits are easily obtainable by all, and every subscriber added to the Association enhances the interest and protection of all; the amount paid being so small, and only at long intervals, that any person can secure for his family a competency upon his death.

CLASSES.—In Class A, all persons between the ages of 15 and 40 years; in Class B, all persons between the ages of 40 and 60 years.

Any one that has not stated his or her age correctly, will forfeit all money paid and his or her Certificate.

One class cannot be assessed if one of another class dies. Classes have no connection with each other.

HOW TO BECOME A MEMBER.—A person desirous of becoming a subscriber must fill out an application, and forward with it Ten Dollars by Check, Draft, or by Express, in gold or silver coin. Persons can pay agents, when regularly appointed and authorized to receive money. Each subscriber should interest himself in obtaining new members, by so doing all are benefited

BOARD OF DIRECTORS.—Benjamin H. Freeman, George H. Russell, Samuel A. Raymond, James A. Pritchard, W. Le Roy.

OFFICERS.—Benjamin H Freeman, President; George H. Russell, Vice President; John H. Warren, Secretary; James A. Pritchard, Treasurer.

Eley's Ammunition.

These Cartridges are made in three sizes, viz., .577 (or Snider Enfield) bore; .500 (or half-inch) bore; and .451 (or small) bore

These Cartridges have been adopted, after careful comparative trials against all other descriptions, by HER MAJESTY'S WAR DEPARTMENT, as the Standard Rifle Ammunition for the BRITISH ARMY, and are not only used exclusively for the Snider Rifle, but are adapted to all other systems of military BREECH LOADING RIFLES.

They are the cheapest Cartridges known, carrying their own ignition, being made wholly of metal, are water-proof and imperishable in any climate.

Boxer Cartridge Cases (empty), of all 3 sizes, packed with or without bullets, and machine for fastening same in Cartridges.

Makers of BOXER CARTRIDGES, .450 bore for Revolving Pistols, in use in Her Majesty's Navy.

PIN CARTRIDGES for Lefaucheux Revolvers of 12 M, 9 M. and 7 M, bore.

CENTRAL FIRE and PIN FIRE CARTRIDGES, for all sizes of Guns, Rifles and Revolvers.

Double Water-Proof and E. B. Caps. Wire Cartridges for killing game at long distances. Felt Waddings to improve the shooting of guns; and every description of Sporting and Military Ammunition.

Wholesale only.

Machinery.

VARNEY'S

PATENT AMALGAMATOR,

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

ELLERY'S PATENT

India Rubber Cement and Paint

—FOR—

TIN, IRON AND METALLIC ROOFS,

Iron, Brick and Wooden Buildings,

SHIPS, STEAMBOATS, STAGES, CARS,

AND FOR ALL EXPOSED SURFACES.

Is water-proof and indestructible; will neither rot, peel, nor crack; will withstand any climate; can be put on in any color, and is less expensive than other Paint.

New Cloth Roofs put on. Old Roofs cemented and painted. Leaky Roofs made tight.

☞ No Coal Tar or Asphaltum used. All work guaranteed. Orders punctually attended to.

A NEW SLUICE

For Concentrating Gold, Amalgam, Sulphurets or Black Sand, in Quartz Mills,

OR PLACER MINES.

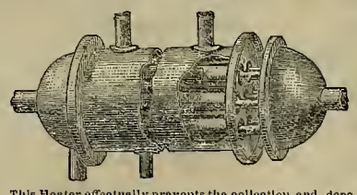
It is made without iron work, is cheap, durable, and effective; can be made by any good mining carpenter at the mine or mill, of sizes to separate the Sulphurets from one to fifty tons of sand per hour. There is no expense for motive power, or to handle the sand, if it can be run from the mine or mill directly into the receiving sizing boxes by means of water. It is continual, self-discharging, and can be used for concentrating fine gold and black sand, on the river bank or ocean beach. They may be seen at work in the American Company's Mine at North San Juan.

For information how to construct, and the cost, address

ORLANDO JENNINGS,
17v18 North San Juan, Cal.

CROSS' COMBINED

Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., of San Francisco, Keep & Bargion, of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to WM. B. CROSS,

White Pine Summary.

TREASURE CITY—STRIKES.—*News*, April 27th:—A very important strike is said to have been made a few days ago, seven or eight miles north of Hamilton, in the White Pine Range. Rock has been obtained which assayed $300 to the ton....The same of 28th says:—The discovery to the north of Hamilton has been the means of creating considerable excitement, and it is believed that not less than one thousand men have visited the scene within the last two days. Many claims have been located, and all speak in flattering terms of the prospects.

Inland Empire, 24th:—Yesterday we were shown a beautiful specimen of ore from a mine located on the 10th. The specimen weighed 74 pounds, and was rich in chloride. The piece was broken from the croppings of the ledge, which is located on Blue Hill, southwest of Hamilton. Two assays made from different parts of the ledge, as samples taken for average, gave $84.24 and $94.43. Arrangements have been made to have ten tons worked at two different mills. The ledge is well defined, is 8 feet thick, and is being developed as rapidly as picks and powder will do it.

Same of 27th:—Yesterday a very rich strike was made in the Glazier mine, near the Eberhardt. A shaft was sunk at the point where the Shermantown trail leaves the Eberhardt grade, and at a depth of 30 feet a body of as good ore was struck as has ever been found in the district. We were shown several pieces which is the same as the first quality Eberhardt.

ANOTHER STRIKE.—At a point four miles from Hamilton, came on a ledge showing chloride ore. After two days work some of the ore was brought into town and three assays made, the lowest of which gave a return of $700, and the highest $3,411.37 to the ton. We roasted some of the ore and found it to be of tho richest character. Mr. Johnson gave us a specimen weighing from five to eight pounds, which shows chloride, bromide, sulphide, etc., in every part of it, and has been pronounced by all who have seen it to be equal to first-class Eberhardt. The name given to the claim is the Mohawk No. 10.

MILLS AND SMELTING WORKS.—*News*, 24th:—The smelting works at Swansea, between Shermantown and Hamilton, started up on Thursday, and operated to the entire satisfaction of the smelter, who is one of owners, Richard P. Jones. We understand that three tons of ore from the Galena mine were run through, producing over 1,100 pounds of metal, worth fifty cents per pound in silver—making $550, or about $166 per ton....Same of 27th:—The crushed bullion smelted at the Swansea works from the Galena mine ore is worth $300 per ton in silver. Flux was used; the blast was simply horse power, irregular and weak. It is thought that the mixing of ores from different ledges on the Base Metal Range, will obviate the necessity of using extraneous flux altogether.

ANOTHER MILL.—The *Reveille* of the 24th notices the passage through Austin, bound for White Pine, of a small mill from Dayton. It is designed for prospecting, as its battery consists of three stamps, 125 pounds each, and it has one pan for amalgamation. The motive power will be either water or horses.

McCone's new mill, located over the mountain due east of this city, will commence operations about the 1st of the coming month.

MINING ITEMS.—*News*, 24th:—EL DORADO.—This ledge is believed to be one hundred feet or more in width, and presents the most encouraging indications in every part between the walls. A considerable quantity of ore suitable for milling has been extracted.

DAWSON.—Some excellent samples of ore were last night shown us from this mine, which is a short distance south of Hamilton. The ledge is represented as being large, regularly defined, and the prospects generally encouraging.

VALUABLE HOUSE.—Down on Chloride Flat there is a miner's cabin built of chunks of chloride ore, estimated to be worth over $2,000 per ton. The house is sixteen feet square, and the rock in its walls, if crushed, would yield in the neighborhood of $75,000. The miners who own and occupy this valuable building, of course are doing so temporarily, and will have the ore milled as soon as practicable.

MAURICE.—Same of 27th:—This morning the work of developing of the Maurice mine, between the Virginia and Adkinson, on the northern slope of Treasure Hill, will be actively commenced. Some very rich ore has been taken from this mine.

SPECIMEN.—We are indebted to Chester Gunn for a large and beautiful specimen of ore from the Cremona ledge, at the foot of

the Base Metal Range, on the road between Shermantown and Hamilton. Two specimens were left with us—one assaying from $700 to $1,000 to the ton; the other, taken some distance along the ledge, at a point where the vein is ten feet wide, assays $200 to the ton. The company owning this mine will be incorporated as the Chester.

PHŒNIX.—*Inland Empire*, 26th:—The shaft is down 40 feet, and shows a fine ledge of good ore. The first work done exposed a large body of rich ore, but soon seemed to pinch out, although the foot wall was perfect, and the miners were guided by it. At 40 feet they broke through the horse or cap, and opened on a large body of quartz partially decayed and showing yellow chloride all through it. The ledge where we saw it is loose and easily taken out with a pick. How wide it is no one knows.

INLAND EMPIRE.—This is the name of a new location made next to Mohawk No. 10, and on the same ledge. We have seen some of the ore, which was of very superior quality. An assay gave a return of $723.60. The ore assayed was taken from the top of the ledge. We assert that the ore we have seen from this ledge, considering that it is taken from the croppings, is superior to any that has yet come under our notice in White Pine District.

THE POGONIP.—On the Pogonip mine are four working shafts. The richest ore is taken from a shaft 27 feet in depth, known as the Othello. We might here state that several locations have been purchased by San Francisco capitalists and consolidated under the name of Pogonip. Second class ore is found in all the other shafts; but the Othello yields first class chloride ore. Large quantities of ore are being taken from this mine daily. So soon as custom mills are here work on this mine will be prosecuted vigorously. In the Othello shaft, while we were in the house, a tub of ore came up from which we picked a piece for assay. The piece yielded $712.46 to the ton. The owners are Charles L. Low, his brother Joseph W., and George Oulton, ex-State Controller of California.

OUTSIDE DISTRICTS.—*Empire*, 27th: The mines are located on Pancake Mountain, 15 miles southwest of Hamilton, and 1¼ miles from the Elko road. The croppings assay about $80 per ton. The ore shows chloride. There has been some 40 or 50 locations made since the mines were discovered, which was about the first of this month.

RACINE.—We have received a copy of the code of laws of the Racine Mining District, which is twelve miles square, with its center at Ward's Spring, in Ward's Cañon.

GOLD AT SNAKE.—A gentleman just returned from the Snake Mountain District, informs us that some very rich gold rock has been discovered about seven miles northwest of the silver mines. Some specimens of the rock are now in this city, and one literally lousy with gold.

COAL.—*Empire*, 27th: The Swansea Coal Mining Co. on Saturday filed its articles of incorporation in the County Clerk's office in this county. Capital stock, $1,000,000, divided into 10,000 shares of $100 each. The property of this company is situated along the road between Hamilton and Shermantown, and consists of four quarter sections of land. Some very fine specimens of coal have been obtained from a shaft now being sunk by the company, and the work of prospecting is being carried on vigorously both night and day.

JAPAN.—A British Consul in Japan, Mr. Gower, gives a remarkable account of the wealth of the lead, iron and coal deposits in the island of Yesso. In one place, coal forms the sea cliffs; and in another he walked four miles over an iron sand, which contained over 60 per cent. of metal. There are also indications of gold and copper.

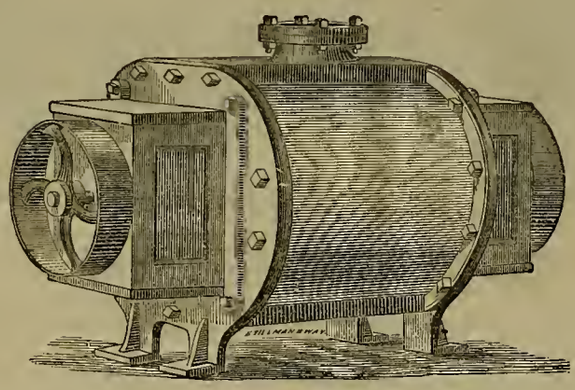
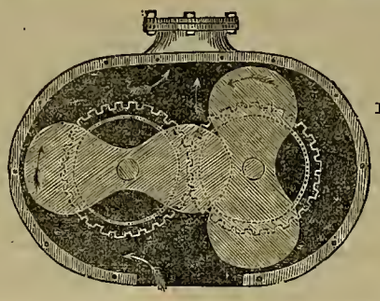
With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 21v15tf

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.
Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.
Awarded the First Premium at the Paris Exposition.



ADAPTED FOR Smelting, Foundry, Mining and Steamships.



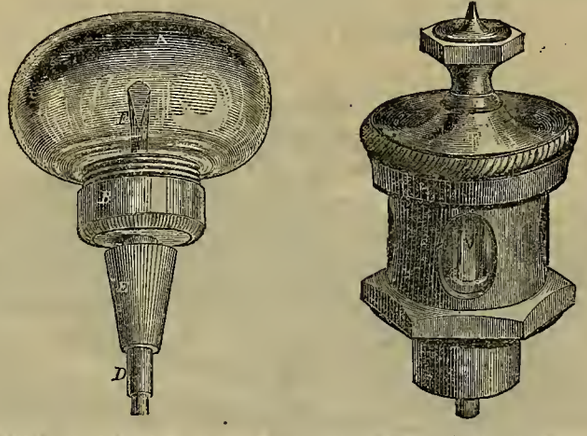
REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address
KEEP & BARGION,
4v16-3m Globe Iron Works, Stockton, Cal.

THE STANDARD OF AMERICA.
DREYFUS' PATENT SELF-OILER.



For Locomotives, Marine and Stationary Engines, Fans, Pickers, Looms, Carding and Spinning Frames, Lathes, Saw Frames, Shafting, and Machinery of every description.

A Saving of from 75 to 95 per cent. Guaranteed.

They are composed of a Transparent Glass Cup, mounted in Britannia and Brass, provided with a hollow tube, inside of which is placed a loose-acting solid wire, which acts as a Feeder and Regulator. The wire rests constantly upon the journal, thereby acting with the bearing in its motion. The wire is so regulated inside the tube as to feed according to the demand only. There is no flow of oil whatever while the machinery is not in motion. They are as reliable in winter as in summer, for the reason that the friction produced by the action of the bearing on the wire causes the wire to heat, thereby causing the oil to become limpid. Being perfectly air-tight vessels, the oil will never gum in them, as this has been proven by two years' constant use. They are constructed in a very neat and substantial manner. We spare no pains in making them as perfect as it is possible for them to be made, and GUARANTEE them to give perfect and entire satisfaction.

DIRECTIONS:

Fill the cup full of oil, then screw the cap down air-tight. Place the tube in the oil-hole in an upright position, or upon an angle of 45 degrees. Permit the rod to have a perfectly free action. If you desire to have the oil flow faster, reduce the wire.

REFERENCES:

For the convenience of persons desiring references, we annex the names of a few Manufacturers and Railroad Companies, who are using the Dreyfus Patent Oiler in different parts of the country: San Francisco—Mission Woolen Mills; Pioneer Woolen Mills; Pacific Woolen Mills; Golden State Foundry; Ætna Foundry; Fulton Foundry; Empire Steam Mills; San Francisco Gas Co.; Mechanics' Mills; Bacon & Co., Printers; Bosqui & Co., Printers; B. It is a gentle Purgative as well as a Tonic.

CALIFORNIA

These Bitters are not a gilded pill to delight the eye or please the fancy, but a medical preparation, composed of the best vegetable ingredients known.

VINEGAR BITTERS,

THE GREAT BLOOD PURIFIER.

Cleanse the vitiated blood whenever you find its impurities bursting through the skin in Pimples, Eruptions, or Sores; cleanse it when you find it obstructed or sluggish in the veins; cleanse it when it is foul, and your feelings will tell you when. Keep the blood healthy, and all will be well.

Dyspepsia or Indigestion.

Headache, Pain in the Shoulders, Coughs, Tightness of the Chest, Dizziness, Sour Eructations of the Stomach, Bad Taste in the Mouth, Bilious Attacks, Palpitation of the Heart, Inflammation of the Lungs, Copious Discharges of Urine, Pain in the Regions of the Kidneys, and a hundred other painful symptoms are the offspring of this Dyspepsia. For these troubles take Dr. Walker's Vinegar Bitters, and quickly all painful symptoms will disappear.

It is a Gentle Purgative as well as a Tonic,

Possessing, also, the peculiar merit of acting as a powerful agent in relieving Congestion or Inflammation of the Liver, and all the Visceral Organs. In this respect, these Bitters have no equal.

For Female Complaints,

Whether in the young or old, married or single, at the dawn of womanhood or the turn of life, these Tonic Bitters display so decided an influence that a marked improvement is soon perceptible in the health of the patient.

For Inflammatory and Chronic Rheumatism and Gout,

These Bitters have been most successful. They are caused by vitiated blood, which is generally produced by derangement of the digestive organs.

PIN, TAPE and other WORMS, lurking in the system of so many thousands on this Coast are effectually destroyed and removed.

Morbid Condition of the Blood.

This is the fruitful source of many diseases, such as Tetter or Salt Rheum, Ringworm Boils, Carbuncles, Sores, Ulcers, Pimples, and Eruptions of all kinds. For the cure of these various affections, which are mere symptoms of a morbid condition of the blood, medical science and skill have not, as yet, discovered a Blood Purifier equal to Walker's Vinegar Bitters.

Diseases of the Blood, Liver, Kidneys, and Bladder.

It thoroughly eradicates every kind of humor and bad taint, and restores the entire system to a healthy condition. It is perfectly harmless, never producing the slightest injury.

Bilious Remittent and Intermittent Fevers,

Which are so prevalent in the Valleys of the Pacific Coast, especially those of the Sacramento, San Joaquin and their tributaries, during the Summer and Autumn, and especially during seasons of unusual heat and dryness, are invariably accompanied with extensive derangements of the stomach and liver, and other abdominal viscera. There are always more or less obstructions of the liver, a weakness and irritable state of the stomach, and great torpor of the bowels, being clogged up with vitiated accumulations. In their treatment, a purgative, exerting a powerful influence upon these various organs, is essentially necessary. There is no cathartic for this purpose equal to Dr. J. Walker's Vinegar Bitters, as they will speedily remove the dark-colored viscid matter with which the bowels are loaded, at the same time stimulating the secretions of the liver and restoring the healthy functions of the digestive organs generally. The universal popularity of this valuable remedy in regions subject to miasmatic influences, is sufficient evidence of its power as a remedy in such diseases.

For full directions read carefully the circular around each bottle.

For sale by all druggists and dealers.

Liberality of Physicians.

[From the Pacific Medical and Surgical Journal.]

It has always been said that physicians would disparage any remedy, however valuable, which they did not originate themselves. This has been disproved by their liberal course towards J. WALKER'S VINEGAR BITTERS, they well knowing them to be an invaluable preparation manufactured from the native herbs and roots heretofore known only to the Spaniards and Indians of California. Many of the profession, after having tested their virtues, have adopted them into general use in their practice, thereby showing a willingness, commendable on their part, to countenance articles that have intrinsic merit. This is highly creditable to the learned profession of California, and contradicts the prevalent notion of their opposition to remedies based on interest to discard them. We have always had confidence in the honorable motives of our medical men, and are glad to find it sustained by the liberal welcome they accord to Dr. J. WALKER'S INIMITABLE VINEGAR BITTERS, even though they are not ordered in the books, but are made known to the public through the newspapers, and other mediums of advertising.

Pure Blood and Pure Water.

Pure blood may be compared to pure water and impure blood to muddy water. If you pass muddy water through muslin, you soil it; continue the process, and you cover it with thick mud. Blood is the great circulating medium, passing through all parts of the body, and, if impure, it leaves its impurities behind, which breed sickness and death. Medical science has utterly failed hitherto to furnish a medical agent for renovating and purifying the blood equal to Dr. Joseph Walker's Vinegar Bitters. They are easy in their administration, prompt in their action, and certain in their result. Their peculiar vegetable properties penetrate at once to the seat of disease, and eradicate all impure or poisonous matter from the system. Climatic changes, which so materially affect the great majority of preparations, have no effect on this remedy. It is used successfully in all climates and countries, north and south alike, and has never been known to fail in a single instance when the directions have been followed. Let those afflicted with disease try one bottle of these Bitters and it will prove a better guarantee of their merits than all we or others can say in their favor. Thousands now pronounced incurable may be saved and their lives prolonged by the use of this valuable medicine. To those who seek health we would say, there is no man, woman or child, however wasted by disease, but what may be relieved or cured by these Bitters, if their system is in a condition to receive nourishment, and the Lungs, Liver and Kidneys and other vital organs, are not wasted beyond the process of repair.

None genuine unless signed

DR. JOSEPH WALKER'S

VINEGAR BITTERS.

San Francisco, Cal., Jan., 1869.

Read the following Letter from Dr. J. Walker:

READER.—Do not cast this aside with a look of contempt. If you chance to be one of the lucky few who are never ailing, preserve this and hand it to your invalid friend, that he may know the means of becoming well, hearty and vigorous, and to live to die of old age.

Four years ago I was, what I thought, "a used up man," which was also the opinion of my friends and acquaintances.

I had the Consumption, Bronchitis, Palpitation of the Heart, Piles, and Rheumatism in my Hip. My leg became paralyzed, and my whole side partially so. I was then in California, and was given up by physicians as incurable. I tried everything I thought would help me that I could find in the apothecary shops, but to no purpose. Die I thought I must.

One day I was near a camp of Indians, and found them gathering and picking herbs. I inquired what they used them for, and they told me. I then went to experimenting on a compound which I perfected and commenced taking, and to my utter surprise, in three weeks was able to attend to my business, and after taking it eight months I felt better than I ever did in my life, and considered myself well. Many persons who knew my former condition were surprised when they saw how well and hearty I was, and came to me for the medicine for themselves and friends. In fact, with my small means of manufacturing, I could not supply the demand. I had to put them up in jugs, junk bottles and anything I could get, and found they produced such astonishing effects upon all diseases, that I thought it my duty to put them within the reach of all suffering humanity.

I moved to San Francisco, and commenced putting them up, calling them J. WALKER'S CALIFORNIA VINEGAR BITTERS.

I have disposed of hundreds of thousands of bottles, and, to my knowledge, not a single person who has taken them but it has helped or cured. On women the effect is magical, making the old fresh and vigorous, and giving to the young life and ambition.

Now I assert without fear of successful contradiction that there is no disease these Bitters will not cure. I know that there are hundreds that will doubt this, but to them I say, bring me the case, and if I do not cure them with my Bitters, I will forfeit $100, providing the lungs are not too far gone, or the bones not destroyed by mineral or other means. People may call me a humbug, and doctors may cry out against me, and well they may, for their occupation is gone.

In conclusion, to the afflicted let me say, give my Bitters a trial, it is all I ask—they will speak for themselves.

Respectfully yours, JOSEPH WALKER.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

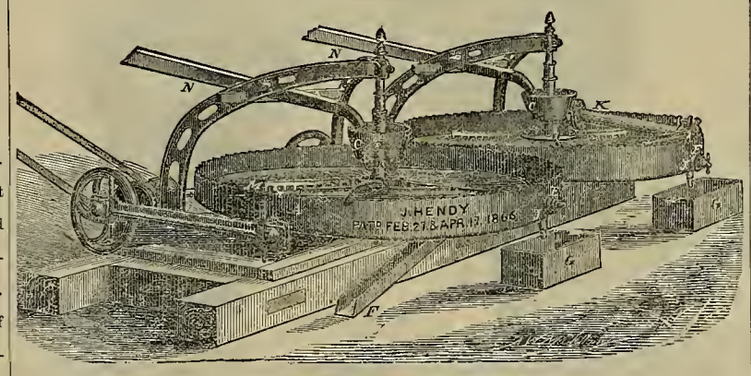
Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

PREMIUM FOR BEST CONCENTRATOR
AWARDED BY THE
MECHANICS' INSTITUTE, 1868,
ALSO AT THE STATE FAIR FOR 1868,
To J. HENDY.



A LARGE NUMBER OF THESE
IMPROVED CONCENTRATORS
ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

OFFICE OF NORTH STAR MINE, GRASS VALLEY, Nov. 12, 1868.

JOSHUA HENDY, ESQ.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.

Respectfully yours, J. H. CROSSMAN, Supt. N. S. Mine.

New Patents and Inventions

The Earth's Surface Oscillations.

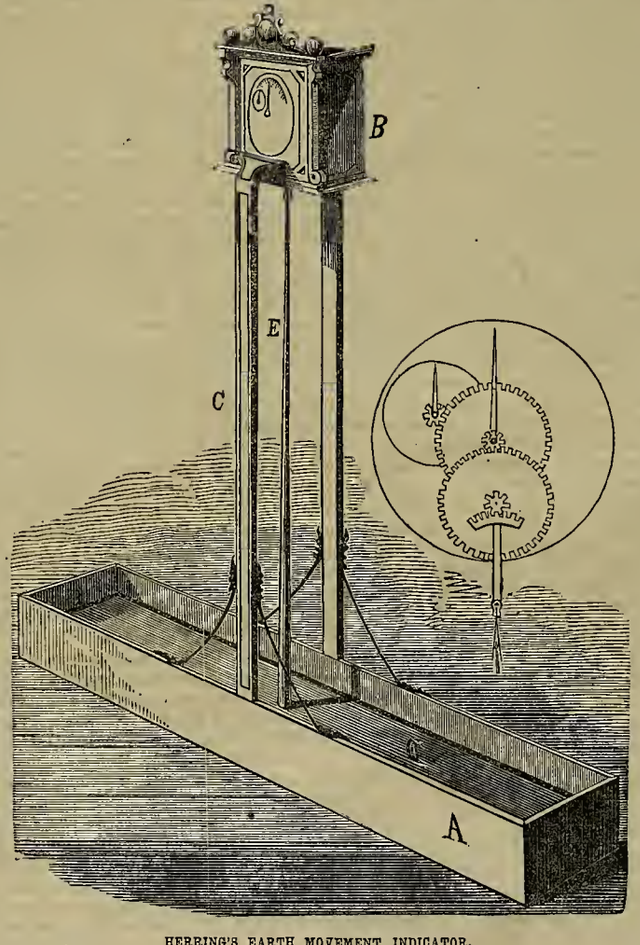
In glancing over that branch of history which records the successive steps that were taken by the living generation's predecessors in the development of our several "sciences," it often appears striking to observe how some of the simplest and most important truths or principles were so long overlooked; until, of a sudden, the surrounding circumstances seemed to develop them and all their connections into something like a necessity, that thereupon riponed into results as naturally as is the case in any other natural "consequences." It seems strange, and yet is a fact, that Geology, the Science of Time,—as Astronomy is the Science of Space,—had its beginnings since the advent of persons living, only a hundred years ago, in that ancient, and very unexcited mining town of Freiberg, in the Erz Mountains. Werner, and Von Buch, the recognized fathers of the science, with Humboldt, and a few other practical students, from frequent going down and employment in the veins of mother Earth, from surveying of faults and tracing of formations above ground, observed that the rocks were not all alike, and began classifying them; the result being a separation of all into a regular series, known and named by fossils of wonderful extinct animals, which reveal to us creations upon creations, and lead us back to an infinite past.

The entire series was sketched on paper, by followers, in a complete section of the earth's crust. The labor that geologists are now doing is principally in mapping the rocks of the globe according to the times, or geological ages, in which they were elevated above the seas, whose living animals they entombed, and so preserved, to declare to us their history and the conditions of the gathering of the precious metals they contain.

The eruptive dykes or veins of granite, trap, porphyry, and lavas, that fill so many of the fissures opened by internal forces, have not furnished us with a satisfactory account of the interior of the thickening crust. No clue is left us but a lithological one, of the chemical results, with the knowledge that they were erupted in the order named. Earthquakes, however, periodically, and sharply, remind us of the same problem in phenomena that group themselves under what we call physics.

Meantime, since all old geological changes are evidently the results of elevation and depression, since earthquakes, too, are but exhibitions of the physical phase of interior geology,—since we are unable to advance any farther at present on the chemico-lithological road,—it seems remarkable that no more has been done by geologists toward a systematic observation and calculation of data from known phenomena under the physical head, in view, especially, of the very striking and important facts touching slow elevation or depression of sides of continents, and changes of plane of level of extensive districts, that have forced themselves upon the attention of man in all portions of the globe.

Detailed facts of this kind are to be found in instances too numerous to mention. A communication in *Silliman's Journal* a few years ago, recorded the fact that the smooth top of a mountain in New Hampshire, which was just visible over some intervening rocks from the door-step of the observer in his youth, had gradually sunk out of sight. It has been proven by the most unfailing tests, that the firm earth is an unsteady base for astronomical observations. Dr. Robinson reports to the British Association "that he found the entire mass of rock and hill upon which the Armagh Observatory is erected, to be slightly, but to an astronomer quite perceptibly, tilted at one season of the year to the east, and at another to the west." Prof. Airey, the Astronomer Royal, says: "There have been instances when the azimuth of the Greenwich transit instrument has varied four seconds, as determined by the opposite passages of the polar star;" and he explains the fact by supposing "that the soundest and firmest earth is itself in motion." Independently of regular oscillation, attributable to lateral pressure from permanent interior shrinkage, or to a supposed daily or annual tidal influence, manifested in a periodical frequency of slight earthquake shocks, another cause may be mentioned, viz., that discovered in an eastern observatory, situated on a cliff of rock where a slight daily oscillation in the level of the instruments was observable, and was ascribed to the expanding influence of the heat of the sun upon the side exposed.



HERRING'S EARTH MOVEMENT INDICATOR.

With a view to observing and recording these ordinarily imperceptible surface oscillations, Mr. F. A. Herring, of Forbestown, California, has invented the device represented in the accompanying illustration, which may be briefly described as follows: The box A, is to represent a large reservoir, partly filled with water, and designed to be placed at sufficient depth in the ground to secure even temperature. O, is a wooden float covering the surface of the water. The slightest oscillatory motion of the earth will change the surface of the water and produce motion of the float and the standard E, whereby action will be imparted from the point of the standard to a system of gearing in the case B, moving the indicator shown on the face of the dial. On the right of the engraving will be seen an enlarged view of the gears, showing the segment which actuates the system through the movement of the depending lever in which the point of the standard E is inserted. Thus, on the slightest oscillation of the float, the point of the standard E will be many times multiplied and minutely indicated by the pointer on the dial-plate.

Whether this is better than any ordinary level may be a doubtful question; the principle we wish to illustrate remains the same. To indicate changes of level in different azimuths, a number of them would have to be used. Vertical elevations or depressions of entire districts or belts could be discovered by a comparison of the direction of a number of angles of greatest elevation, taken at different points.

A map of actual elevations and depressions in progress at different points on the surface of the earth—known, or believed to be constant in their character—has been attempted by Andrew Murray, in his "Geographical Distribution of Mammals," (London, 1866). The entire eastern coast of North America, from Greenland to Texas, is represented as an area of subsidence; the western coast, including all of South America, as an area of elevation. The Sandwich Islands are marked as rising, the Marquesas as sinking; South Australia as rising, and North Australia as sinking. Earthquakes and volcanoes appear to be very frequent only on rising ground.

It is evident that so rapid a sinking, geologically speaking, as is shown in the tide mills on the New Jersey shore, would, in the smallest fraction of time, such as we see marked in geological results, be enough to transform whole States, and even continents, into sea-bottoms, or vice versa. Violent upheavals are not now believed by geologists to have been amongst the ordinary and most general agencies of geological change.

As to earthquakes, we know they are happening every day, and probably unceasingly around the globe. The Admiralty Manual of Great Britain figures *seismometers*, by which the more violent features can be observed. But with more delicate instruments slight shocks otherwise never suspected, and happening at very great distances, can and *will* be hereafter more observed.

[Continued on page 308.]

[From Rowlandson's "Earthquake Dangers, Causes, and Palliatives"—just published.]

Hardening of Mortar, Climatic Conditions, Etc.

Lime, as is well known, when made into a paste with water, forms a somewhat plastic mass, which sets into a solid as it dries, but afterwards cracks and falls to pieces. Lime, consequently, does not possess sufficient cohesion to be used alone as mortar. To remedy this defect, and to prevent the shrinkage of the mass, the addition of sand is required. Sharp, quartzose river sand, is best adapted for this purpose. Books direct that the sand to the lime employed in making mortar should not be less than three measures of sand to one measure of lime, or more than four measures of the former to one of the latter. My own experience is, that if both materials are of the best quality, at least three and one-half measures of sand should be mixed with one of lime; and even a mixture of four measures of good Black Point sand mixed with one measure of well-burned Santa Cruz limestone, would make a much better cementing material than anything of the kind which I have seen used in the erection of stores and buildings in this city. I have used Black Point or North Beach sand for the purpose of illustration, because the sand at those places presents the general qualities of that material likely to be continued in use for the purpose of making mortar in San Francisco. It is sand of a quality that may be termed fair for the purposes under consideration, but not first-class When less than three and a half measures of sand to one of lime are used, the mortar so compounded does not set so well, nor so quickly, as with the proportions recommended. For building garden walls and masonry, or brick-work of a similar character, even one barrel of good lime, if well mixed with five barrels of the sand named, will afford, in most localities, a good enough cementing material for the purpose required in such instances. After the mortar has been *laid*, its subsequent hardening depends chiefly upon the thorough incorporation of the lime and sand during their mechanical intermixture.

This hardening of mortar is a somewhat obscure subject, and has never been sufficiently investigated in a scientific manner, though the writer believes, for reasons which will afterwards be adduced, that few subjects possess (unless masonry and brick-work are to be abandoned in the future erection and re-erection of stores and dwellings) a more economical interest to the residents of a city placed like San Francisco in a district which from time to time will be subjected to eartbquake shocks.

After a careful examination of the damage done by the earthquake of 1865, I came to the conclusion that all the structures then injured, with very few exceptions, had their primary origin in defective mortar. The falling of the front of Popper's building was in consequence of a defectively supported and inartificial arch. The bricks displaced on the fire-walls of the same building could scarcely be chargeable as having been caused by using bad mortar, seeing that they had not been set more than a few days. Another marked exception I noted, to which the charge of bad mortar could not be fittingly applied, viz: the case of the entire front of a building, in the course of erection on Pacific street, which was thrown bodily into the street. In the latter case the bricklayers had only ceased working on the afternoon previous (Saturday), and the mortar had not time to set. A few cases also occurred where long and elevated fire-walls, not strengthened by any brace, were wholly or partially thrown down. All the other accidents on the occasion of the earthquake of 1865 may be traced absolutely to the circumstance of employing a bad material of mortar for building purposes. Similar remarks to those last made would apply, with pretty nearly equal justice, to the San Francisco earthquake of October, 1868. In the latter instance, however, no small share of the damage occasioned took place on, and was in a large measure caused by, the injured buildings having been built upon an artificial and imperfectly made foundation.

The simplicity of the operation of making ordinary lime mortar is such that the primitive method adopted thousands of years ago, has been continued over the lapse of the long intervening ages, without other change than the varieties in slacking, and the proportions of the ingredients to be mixed, just as the operator was desirous of obtaining a first rate or inferior article, accordingly as wisdom or ignorance or roughish parsimony, prevailed. Notwithstanding the antiquity of the process, and the long continued observation of the *hardening* of mortar in masonry and brickwork, on which quality its valuable property as cementing material almost wholly resides, the theory of this *hardening* is very obscure and imperfectly, if at all, understood. The writer became more specially impressed with the last named fact in consequence of hearing it repeatedly remarked after the earthquake which occurred in October 1868, in reply to observations made by him respecting the inferior character of the mortar employed for building purposes in San Francisco, that this inferiority arose from the mixture of impurities, such as decaying vegetable matter, salt, etc., in the sand employed in making the mortar used in this city; but the most observant and those most practically acquainted with the subject, such as architects, builders, etc, have in general arrived at the conclusion that some unknown climatic cause was the influencing agent in causing the solution of cohesion of mortar in this locality. My own views in the first instance were that overdosing mortar with sand, and aggravating the evil by using simultaneously a portion of hydraulic cement, accompanied by insufficient incorporation of the materials employed, were the chief influencing causes in occasioning that friable condition of mortar observable, after having been used only a few years for architectural purposes.

That climatic conditions should entail such deteriorating consequences as have been asserted by many, was, and still is, much doubted by the writer, yet a more careful study of the subject induces him to infer that these conditions may, and probably do, in more ways than one, injuriously affect the quality of lime mortar as a cementing material in our California climate,—a circumstance, however, greatly aggravated by the use of too large quantities of sand and mixing with hydraulic cement,in place of using pure lime, sand and water alone. It is well known that the induration of lime mortar is principally, indeed, for practical purposes, wholly induced by the absorption of carbonic acid,—in other words the reconversion of the lime of the mortar into its primitive condition of carbonate of lime, limestone, or chalk. This process of reconversion of the lime in mortar into a carbonate continues over a great length of time, especially in dry climates, and for the purposes of this inquiry the climate of California may be classed as amongst the dry ones. Well made lime mortar, after its application, becomes dry upon its surface, while at the same time it absorbs carbonic acid from the atmosphere; so far, however, as experimented on by the writer, with mortars from old castles erected from four to seven centuries ago, in various parts of Cumberland, 'Westmoreland,' Lancashire, Yorkshire, Chesbire, and Staffordshire, a portion of the lime was always found in the caustic state or uncombined with carbonic acid, and Dr. Malcolmson found that mortar obtained from the Great Pyramid still contained a large portion of hydrate of lime.

A recent writer in the *Chemical News*, however, has stated that mortar obtained from Pevensey Castle, England, was not only free from any trace of hydrate of lime, but of silicate of lime also. I have quoted the last statement because such an occurrence is different from my own trials with mortar obtained from old castles in other situations, and also as being at variance with the results of all other experiments on this subject with which I am acquainted. This last circumstance is, however, one of very little economical importance to the matter at present under consideration.

If, on the contrary, fresh-made mortar is preserved from access of the atmosphere by any means,—such as being placed under ground, or being closely covered, especially if in considerable masses,—not only will its original properties be fully maintained, but its utility as a cementing material will be increased; the fact that old but well-preserved mortar was superior to that newly made, was a fact recognized and acted upon by the Romans, for, according to Pliny, Roman builders were forbidden by the law from using mortar less than three years old. At Vienna, I am informed, a law exists that mortar shall not be used until it is twelve months old. Of recent cases, commented upon by celebrated engineers, may be mentioned one which occurs in the writings of Smeaton, the engineer that designed and superintended the erection of the Eddystone Lighthouse. Smeaton had occasion to take up a large flat stone, of close grain, of about five feet square, that had probably not been moved for more than a century, having formed the bottom of a malt cistern, found on its removal that it had been bedded on a thick mass of mortar, which had become coagulated to a thick mass resembling cheese in consistence; but had never become perfectly dry, the original humidity having been so far retained that on being subsequently well beaten up without any addition of water, and afterwards allowed to dry, it speedily *set* to a stony hardness, the induration being much more rapid than what is observed with mortar as ordinarily made, and used soon after being mixed. One of the most remarkable instances of a similar character occurred at a German fortress, whose name I do not now remember, when in consequence of a siege, a large quantity of mortar, not being needed for present use, was covered up, and afterwards forgotten until subsequently discovered nearly two centuries after it had been made; the quality of the mortar so preserved was found on trial to be of the most superior quality. In employing old-made mortar, it should be kept in view that it ought to be well mixed, mechanically, before use, otherwise the major part of the benefits derivable from the employment of old, but not desicated mortar, will not ensue. There can be no doubt that the extra mechanical mixing required by long made hydrated mortar forms a most important feature in promoting its utility. As an illustration of this point it may be mentioned that it has long been known that grout, which only differs from ordinary mortar in consequence of its being made more liquid, owing to a more liberal use of water, is frequently found to *set* with difficulty; if, however, previously to being used, such grout is long and thoroughly beaten and mixed, it will be found, on application, to harden much more rapidly by such beating, often being found susceptible of hardening in the course of four-and-twenty hours.

There exists no doubt in the mind of the writer that one of the causes for the superiority of mortar that has been long made is found to be in the fact that the lime employed becomes more thoroughly hydrated, as it is well known that the ordinary plastering of walls occasionally *blisters*, in consequence of deficient hydration of the lime composiug the plaster, when the latter has only been recently prepared.

Although the last named fact is by no means an unimportant one, it will not suffice for the great advantage found to be derived from the use of mortar that has long been mixed, the chief cause of the beneficial effects derivable from employing mortar that has been long made must be sought for elsewhere. To the writer it occurs that the great difference which takes place in the time required for hardening, and the full development of the cohesive and adhesive properties, of newly and long-made mortars, arises from the fact that in new-made mortar the hydrate of lime exists in an amorphous, while in old-made mortar the lime, either wholly or partially, changes the amorphous hydrate into the crystalline condition, the latter being one more probably calculated not only to retain moisture but also to absorb more readily carbonic acid from the atmosphere, its molecular condition at the same time being more susceptible of conversion into a crystalline carbonate, by the absorption of the gas named. If future experiments should demonstrate the opinion just given as being based on correct views, it would be easy to point out modes by which the same end could be attained without waiting the slow influence exercised by time, however sure and beneficial that influence may be.

From the function which carbonic acid plays in the hardening of mortar, the consideration of its properties is intimately allied with the development of its full adhesive and cohesive powers. This gas is absorbed in volume by water, to a trifle more than its own bulk, at the ordinary temperature and pressure of the atmosphere, being proportionately less, with the increase of the former and decrease of the latter, the proportion absorbed by vapor of water is probably *cæteris paribus* in like proportion. In England, which may be said to possess a moist elimate, it has been ascertained that its atmosphere contained in 100 volumes, 1.40 of aqueous vapor, and .04 of carbonic acid. Yet from such a small proportion of carbonic acid existing in the atmosphere, all the lime mortar which we employ for building purposes has to become indurated by its absorption,—an absorption which will be accelerated or retarded in proportion to the moisture present in the mortar employed, or in the atmosphere. If moisture is retained by mortar, from that cause alone it will be more susceptible of absorbing carbonic acid from the atmosphere. If the atmosphere happens to be saturated with aqueous vapor, it will yield carbonic acid to newly-laid mortar in greater quantity. If, however, the atmosphere happens to be a dry one, as that of California is during the Summer months, the tendency will be for the atmospbere to withdraw moisture from fresh-laid mortar, and thus impair its power of absorbing carbonic acid, while at the same time it is highly probable that in such a desicated state of the atmosphere a less volume of carbonic acid exists therein than when the same is more saturated with aqueous vapor. It is from the causes just assigned that it has been observed that the mortar employed in building in San Francisco hardens more rapidly in the winter than in the summer season.

As if to render these unfavorable conditions still more injurious, hydraulic cement is habitually mixed, in San Francisco, with lime mortar. Such a step undoubtedly aids the more immediate hardening of the mortar so made, but it is at the expense of the future adhesive and cohesive properties which it would attain in the course of time, by the slow absorption of carbonic acid.

Losses by Cattle Sickness.—Mr. Capron, in his agricultural report for 1867-8, says that the annual loss of farm animals, in the United States, from fatal maladies (deaths from old age or accidents not included) reaches the enormous total of $50,000,000 in value. The losses of swine from "eog cholera" and other diseases, peculiar to that class of animals, is set down at $10,000,000. These are large sums to be taken from the pockets of the people, and seems to call loudly for some reliable system of medical practice, by which the diseases of our valuable domestic animals may be treated. It is a singular and deplorable circumstance, in view of the above facts, that there is no properly organized institution in this country where the medical treatment of animals can be studied. Such institutions have long existed in Europe, and are found very useful in keeping the country free from a horde of vulgar empines, and in providing a well educated class of men, whose occupations are both useful and honorable. The Commissioner has done a good service to the country in calling attention to this great necessity; and agricultural organizations, throughout the Union, will do well to agitate the matter, until some definite steps are taken to meet the emergeucy.

More Mills.—The *Empire*, published at White Pine, is informed that ex-Governor Low of California, has been directed by the owners of the Pogonip, to order the machinery for a mill, and that it will be ready to work in a couple of months.

Size of London.—It has 320,000 houses. Its streets would, if placed in line, reach from Liverpool to New York. It has 360,000 street gas lamps. It uses 44,000,000 of gallons of water per day.

Mechanical.

GUNPOWDER HAMMER.—Thomas Shaw, of Philadelphia, has invented a hammer for pile driving or other purposes, in which the effective force is increased by a small charge of gunpowder. The powder is placed in a cylinder separate from the hammer, and resting upon the pile or other object to be struck. A plunger upon the under side of the hammer fits into this cylinder, and at its fall is forced into it, compressing the air and heating the powder, which is exploded; thereby not only forcing the cylinder downwards with about eight times the force which the fall alone of the hammer would have exerted, but also throwing up the hammer again to its place, where it is caught and held by a pawl in the side rack. For the next blow it is again released by pulling a cord attached to this pawl.

CALCULATION FOR THE BENEFIT OF EMPLOYERS.—In a lecture at the Royal School of Mines, Mr. Warington Smyth, after describing the old arrangement which obliged miners employed in shafts to climb up and down long ladders every day, to and from their work,—says: "At last in 1839 a machine was contrived in the Hartz for raising and lowering the men. The importance of the change will be obvious if we consider the actual loss to employers (let alone the wear and tear on the men), as it often takes half or three-quarters of an hour to go down and to come up. Let us suppose 600 men are employed, and have to descend 1,200 feet to their work, and that each man weighs 120 pounds. Each man will have, of course, to lift his own weight, and, therefore, the whole will lift—600×120×1,200=86,000,000 pounds. To raise one million of pounds a foot is a good day's work for a man, so that there is lost the work of 86 men. Taking each man's labor as worth 6*s.* a day, that gives a total of 12*l.* 18*s.* loss in money value per diem, or for 300 working days in the year, 3,870*l.* per annum is lost. This is a sum large enough to put up a steam engine and raise and lower the men by machinery. The idea was hit upon in a similar manner at the same time in Cornwall. Watching the action of the pumping-rod, the two observers conceived the idea that by making a foot-hold on the rod, the miner would be drawn up the length of each stroke, when he could step off on to a platform, and then on to the rod on the other side, which would just be ready to ascend."

PHOTOGRAPHY AT NIGHT.—A newly-devised closet of reflecting paper-cloth contains the sitter, and the burning of a little magnesium at the top furnishes the light. The pictures are taken in twenty seconds, at a cost of nine cents. The arrangement is patented by an inventor in Salem, Mass. The newness and the success of the thing is in the fact that the light-colored walls of the oval closet are very near the sitter, and the light therefore thrown upon him in every direction.

QUICKSILVER COATING FOR IRON.—The iron is cleaned with hydrochloric acid, and then immersed in a dilute solution of sulphate of copper with a little of the acid aforesaid. The thin coat of copper produced thereby is to be cleaned off; the iron is then placed in a very dilute solution of corrosive sublimate, with a few drops of the acid. The iron will now be covered with a mercurial coat, which cannot be rubbed off. If washed with muriate of ammonia solution, it will effectually prevent rust.

THE SIEBERT PROCESS.—A company of Baltimore capitalists has purchased several thousand acres of land in Virginia, upon which they propose to establish extensive iron works, where the Seibert process, for making steel direct from the ore, will be employed.

CYLINDER CONTENTS IN GALLONS.—A simple rule for finding the capacity of cylindrical vessels in gallons, when the dimensions are taken in inches, is to multiply the square of the diameter by the hight, both in feet, and by 5⅞, which gives a correct answer to one gallon in twenty thousand. *Cor. Scientific American.*

TEMPERING STEEL.—An English blacksmith claims to have discovered a mixture which will give to the commonest steel the grain and the temper of the finest cast metal, and, moreover, will bring back the original quality of steel which has been burnt. The mixture is as follows: with sixteen litres of distilled water mix one kilogramme of hydrochloric acid, nineteen grammes of nitric-acid at 36°, twenty-one of sulphate of zinc, and one hundred of tripoli. In this is to be placed a piece of cast iron of the first fusion, weighing one hundred grammes; when the mixture has acted on the iron for twenty-four hours, the composition is ready for use in the ordinary way, and remains effective till it is all used.—*Colliery Guardian.*

WATER-PROOF GLUE.—We find the following among the "Answers" in the *Am. Journal of Mining:* "It is easy to add to a dissolved substance an ingredient which will, when once dry, prevent it from dissolving again. Bichromate of potash is such an ingredient; but when this is used, the glue should be exposed to light, which will make it totally insoluble. The addition of white lead ground in oil to the watery glue solution, making an emulsion by means of borax or ammonia, is another prescription; likewise, the addition of a solution of rubber in benzole, etc. Paris white, zinc white, or white lead, all in very fine powder, diminish to a certain extent the solubility of the glue.

EXTRACTING ALUMINUM FROM ITS ORES. A Boston chemist has patented the following method: He mixes alumina with gas tar, resin or petroleum, which is divided into pellets; these are dried in an oven, then placed in a strong retort, lined with plumbago, and exposed to a cherry-red heat. Hydrocarbon gas is generated and pumped into the retort, and the supply maintained. By this process the alumina is reduced and the metallic aluminum remains as a spongy mass, mixed with carbon. This is then remelted with metallic zinc, and when the aluminum has collected in the metallic state, the zinc is driven off by heat.

CARS ADJUSTABLE TO GAUGE.—Ten freight cars have been built to run between Chicago and Boston,—changing twice on the route from one gauge to the other. "The device is simple,—consisting of a tube or 'sleeve,' on the inside of the wheel, and homogeneous therewith, through which the axle passes, being fastened thereto by keys dropped into the axle, which are held in place by a longitudinal pin, itself secured by a screw. A car can be changed from one gauge to the other in twenty minutes, the keys being taken out, and the cars three at a time being run along a widening or narrowing track."

HORSE-POWER IN THE STEAM ENGINE.—The usual estimate for one nominal horse-power in the steam engine is that the product of the pressure on the piston in pounds, with the distance passed over in one minute in feet, is 33,000; consequently, a pressure of 33,000 pounds moving one foot, 3,300 pounds 10 feet, 330 pounds 100 feet, or 33 pounds 1,000 feet, would be considered equal to one-horse-power.

TRANSPORTING MATERIALS.—A new method of transport adopted in England for conveying stone from quarry to railway, three miles, consists in the employment of an endless wire rope, supported on pulleys, at a considerable hight from the ground on stout posts. A portable steam engine drives the rope at about five miles an hour, and it carries with it a continual stream of boxes, each holding one hundred weight of stone. The full boxes travel at one side of the support, and the empties return at the other.

TO COLOR ZINC BLACK.—Zinc may be given a fine black color by cleaning with sand and sulphuric acid, and immersing for an instant in a solution composed of four parts of sulphate of nickel and ammonia in forty of water, acidulated with one part of sulphuric acid, and washing and drying it. The black coating adheres firmly, and takes a bronze color under the brusher.—*Knapp.*

WELDED BOILERS.—A contract was recently let to a Belgian firm for the making of twenty boilers thirteen feet long and three and a half in diameter,—the whole to be of half-inch plates, and to be *welded* throughout. No English firm would take the contract.

MACHINE TOOLS.—"One of the best features of modern mechanical engineering is the use of special tools that can do one thing rapidly and truly, instead of convertible tools that can do anything."—*American Artisan.*

Scientific Miscellany.

The Amœba.

This extraordinary organism, the simplest living sarcode, is thus described, in popular language, by the *London Quarterly:* "Conceive of a minute drop of transparent jelly, invisible without a microscope, studded with a dust of opaque granules; sometimes hiding in its midst a more solid rounded body or kernel called the nucleus, and perhaps with the outer rind a little different from the internal mass. Conceive of this *amœba* as of no constant shape, but shifting, as we look upon it, from one form into another. At one moment it is a star with straggling limbs, at another, club-shaped; now it is a rounded square, soon it will image an hour-glass. None of these changes can be referred to currents in the water, or to any other forces acting directly upon it from without. It seems to have within it an inborn power of *flowing*, whereby this part or that moves in this or that direction. * * As it moves without muscles, so does it eat without a stomach. Meeting in its travels with some delicious morsel (diatoms are its food), it *pours* itself over its meal, as if a piece of living dough were to creep around an apple and knead itself together into a continuous envelope. Watching the feed thus enveloped, we see it grow fainter and fainter as its nutritious constituents become dissolved; and when all the goodness has been got out of the meal, the body of the eater flows away from the indigestible remains just in the same way that it flowed around the original morsel. This creature, eating without a stomach, moving without muscles, feeling without nerves, and breathing without lungs,—a being of no fixed shape,—which changes its form according to its moods, and turns its outside into its inside whenever it pleases,—which is without organs, without tissues, a mere speck of living matter all alike all over, nevertheless builds shells which are in many allied forms "of extraordinary complexity and singular beauty." Prof. Huxley says: "That this particle of jelly is capable of combining physical forces in such a manner as to give rise to those exquisite and almost mathematically arranged structures—being itself structureless and without permanent distinction or separation of parts—is, to my mind, a fact of the profoundest significance."

NITRATE OF SILVER TEST FOR ARSENIC. C. E. Avery in *Silliman's Journal* for March, says that it is not easy, without great care, to detect small quantities of arsenic by this test as usually applied, because the arseniate of silver is soluble both in ammonia and dilute nitric acid; but that if the liquid to be tested is rendered incapable of dissolving that salt, the test is easily made. He says: "I find, by experiment, that the addition either of acetate of sodium, acetate of ammonium, or Rochelle salt, to a mixed solution of arsenic and nitric acids, is sufficient to insure the immediate precipitation of arseniate of silver, when ammonio-nitrate of silver is introduced. By placing a small quantity of a nitric acid solution of arsenic acid upon a watch glass, stirring into it a few drops of a strong solution of either of the alkaline acetates or of Rochelle salt, and then adding a drop or two of ammonio-nitrate of silver, the characteristic brown-red precipitate of arsenate of silver is at once thrown down, even when the solution under examination contains comparatively little arsenic."

THE ACCEPTED SOLAR SPECTRUM THEORY WRONG.—In M. Janssen's report on the observations made at Guntoor upon the eclipse of August last, he remarks that the "promineuces" gave bright-lined spectra only, without the dark lines of the solar spectrum. Upon this point he says: "Now it must be admitted that if an atmosphere composed of the vapors of the different elementary bodies whose presence has been recognized in the sun did really surround the photosphere, it would give a spectrum at least as brilliant as the 'prominences' consisting of gaseous matters in a far more dissociated and less luminous state. It must, therefore, I think, be allowed either that this atmosphere has no existence, or that its altitude is so small that it has escaped our notice. I confess that this deduction has not taken me by surprise. My study of the solar spectrum has led me to doubt the existence of any extensive atmosphere surrounding the sun, and I have been induced to believe more and more that the phenomena of elective absorption are in truth produced in the photosphere itself by vapors, or by the floating particles, solid or liquid, of photospheric clouds. This view appears to me not only to accord with M. Faye's theory of the constitution of the photosphere, but to be in a measure necessitated by the acceptance of this theory. In fine, the eclipse of the 18th of August to me appears to demonstrate that the constitution of the solar spectrum has *not* been satisfactorily explained by any hitherto accepted theory, and that the subject needs reconsideration."

SALT AS A MANURE.—M. Peligot thinks that scientific agriculturists labor under delusione in reference to the action of salt; he believes that in the case of impermeable soils through which the water passes slowly, the influence of salt is more hurtful to crops than beneficial. He is opposed to the notion that it undergoes a change in the soil by which it becomes carbonate and then nitrate; in fact, the only use of salt which he recognizes is that due to its antiseptic action, by which it retards the decomposition of ordinary manures.

OXY-SULPHIDE OF CARBON.—This gas has recently been discovered by Thau. It is composed of one atom of oxygen, and one atom of sulphur, and may be regarded as carbonic acid in which one atom of oxygen is replaced by one atom of sulphur. It is formed when not too dilute sulphuric acid acts upon sulpho-cyanide of potassium, and must be freed from hydrocyanic acid, vapor of water, and sulphide of carbon, that are simultaneously produced.

This newly-discovered gas appears to be widely disseminated in nature, but as it is so easily changed by water into carbonic acid and sulphureted hydrogen, it frequently escapes detection. It is undoubtedly contained in most mineral springs where carbonic acid and sulphur are present. These mineral waters, fresh from the spring, have no disagreeable odor, but in a few days smell decidedly of sulphureted hydrogen. Practical applications of the gas remain to be suggested, but it is an important scientific discovery.—*Journal Applied Chemistry.*

TRANSMISSION OF GASES THROUGH COLLOID SUBSTANCES.—In a recent lecture at the Royal Institution, Dr. Odling said, in regard to the transmission of gases through india-rubber, etc., that the "gas appears to be condensed at the nearest surface and to pass through the pores of the material as a volatile liquid, which evaporates on the other side. He took a long glass tube, with its upper end closed with a single thickness of calico. When the tube was half filled with colored liquid and its lower end placed in a dish of water, the water in the tube ran out, because of the rapid passage of air through the holes in the calico. But when the calico was wetted with water, the column of liquid was sustained in the tube, as air could enter then only by dissolving in the water and evaporating on the other side—a very slow process. Ammonia being very soluble in water, passed through quicker, which the lecturer proved by inverting a jar of ammonia over the wet calico, thus causing the liquid in the tube to descend more rapidly. Liquid ammonia dropped upon the wet calico was also seen to act more vigorously than the gas which had to dissolve in the water before it began to pass."

THE "BLUE CUP" OF THE CANDLE FLAME.—E. W. Hilgard on "Luminous Flames," in *Silliman's Journal*, says:

"The part performed by the blue cup, viz: that of a self-heating retort with walls impervious to oxygen, in which dry distillation is accomplished; its theoretical import, as the counterpart of the luminous portion, where the same gases are burnt with evolution of light, render the neglect with which it has been treated doubly surprising. That it is totally distinct from the outer veil is rapidly perceived when the eye is protected from being dazzled by means of a screen of the shape and size of the luminous hollow cone. The veil is then seen surrounding the blue cup as well as the higher portions of the flame, and is thus proved to be nothing more than a zone of glowing gas; which of course, however, cannot be strictly defined from the luminous envelop, the oxidation being a gradually progressive one, from the highly luminous central portion to that brownish, semi-transparent zone of transition, where the carbonic oxide, burning simultaneously with hydrogen, fails to produce its characteristic blue tint because of the excessive temperature existing there."

[Continued from page 305.]

We recently alluded to interesting observations of the kind that were made at St. Petersburg. The angle of emergence of the wave force being noted, calculations of the depth of its origination can as easily be made as a meteor can be located flying; and the results could be mapped on circular planes of paper or pasteboard fitted into a glass globe. It is not unreasonable to expect that even the most casual observations of the earth's surface oscilations, whether of the slow and regular kind ascribable to the lateral contraction of the crust, or the manifestatation of earthquake forces whose origin is yet more in dispute, will ere long carry us considerably in advance of our present knowledge touching the philosophy of the framework of the globe, the mountain lines and continental expansions that give its surface character and beauty, the entire series of unstratified rocks that come from the interior, the philosophy of earthquake centers, and the origin and direction of mineral viens.

Mr. Herring has an eye also to practical matters, as will be seen from the following remarks advancing a tidal theory of earthquakes:

"The disturbing forces are both cosmical and tellnric. It is well known, that the combined attraction of the sun and moon, lifts the waters of the ocean several feet above the average level. While the earth was yet plastic, there must have been a daily tidal motion of the molten mass, and as the crust formed there must have been a succession of slight earthquake shocks, due to the rising and falling of the parts as the crust adapted itself to the changing form of the earth.

"This daily tidal motion continued during the period of the folding of the early formed slates and up to the beginning of old red aandstone era, and perhaps later.

"If we refer this periodical tilting motion to the annual tidal motion of the molten mass within those slight oscillations of the soil which occur so frequently in countries subject to earthquakes, may be due to the slight annual variation in the form of the earth, and shonld occur most frequently at the ebb and flow of such tide. Numerical inquiries on the distribution of earthquakes throughout the conrse of the year, such as those of Von Hoff, Peter Merrian, and Fredrick Hoffman, bear testimony to their frequency at the periods of the equinoxes. The slight oscillations arising from the alteration in the form of the earth, are quite distinct from the desolating earthquakes due to its reduction in bulk.

"In order to show that the interior of the earth ia of a yielding nature, it is only necessary to mention the well known fact, that while some portions of the earth's crust have been permanently upheaved, considerable areas have been depressed or sunk to great depths. These forces are ever active; that which arises from the shrinkage of the molten interior, being adequate to cause destructive earthquakes, while that arising from the attraction of cosmical bodies is an aggravating force which would have a tendency to determine them within certain limits, viz., the period of the equinoxes, and probably cause them to be more frequent at or near the conjunction of the moon with the sun. If these premises are correct, there should be a constant oscillatory movement in the earth's crust, as is proven by the observations of astronomers. This oscillatory movement is supposed to increase in intensity as the period of desolating earthquakes is approached, or until the solid crust is unable longer to resist the immense lateral strain. Now if we had an instrument sufficiently sensitive, the amount of this oscillatory movement might be detected and measnred up to the crushing or breaking point. After this is once ascertained, an approaching series of destructive earthquakes might be detected and its period foretold with unerring certainty."

A batch of metallurgical subjects, including a newly patented electro-metallurgical process, the invention of Prof. A. F. W. Partz, of Oaklaud, will be noticed next week.

In Press.—A small pamphlet, entitled "Treatment of Rebellious Silver Ores by Amalgamation, Without Roasting," by Chas. H. Aaron, will soon appear, published by Dewey & Co.

Communications.

[Written for the Mining and Scientific Press.]

Ore Deposits and Geology of Treasure Hill and White Pine District.

BY J. E. CLAYTON, M. E.

GEOLOGICAL AGE AS DETERMINED BY FOSSILS.

The interior plateau of the Continent lying between the Sierra Nevada and the Rocky Mountain ranges, commonly called the Great Basin, has been so repeatedly described, that it is unnecessary to attempt it in this connection, further than to say that it is a great plateau of mountains and valleys, varying in elevation from four to ten thousand feet above the sea level. This is the great volcanic belt of the continent, extending from Arizona and Southern California northward to the Arctic regions. The original bedding of the secondary rocks has been subjected to greater disturbances, more extensive upheavals, and a greater variety of breaks and displacements, than can be found in any other portion of North America. Hence the mining districts are like islands in an ocean, without any well defined counection or system of continuance, as in California, or in the Appalachian chain in the Atlantic States. In many other respects this portion of the continent presents unusual features, such as the presentation of the Silurian rocks in isolated patches here and there in the southern and eastern portions of Nevada, with some members of the later periods in contact, showing that the rocks of the intermediate periods are not represented, suggesting the supposition that the older rocks were above the ocean level during those intermediate eras of time.

At Silver Peak the Tertiary rocks and clay-beds lie upon the older Silurian, without any representative of the intermediate periods; while at Volcano, New Pass and Humboldt districts, lying from 60 to 150 miles to the northwest, the Triassic and Jurassic rocks are well represeuted, with scarcly a trace of other geological series. In the Ione or Union districts, skirting the western line of Nye county, some of the carboniferous slates and limestones are found with the Triassic rocks in limited quantities, generally overlying porphyry, greenstone and granite, or else presenting themselves in upheaved and contorted atrata, along the sides and foot-hills of the granite and porphyry ranges.

White Pine District is almost exclusively in limestone of the Silurian age. The thickness of the lime strata cannot he determined closely, for the reason that the upheaval and displacement has not brought to light the underlying rocks. Sufficient displacement has occurred, however, to expose a thickness of abont 800 feet of limestone, in beds or strata varying in thickness from six inches to twenty feet each. The greater mass of the lime rock has been so much changed by chemical agencies, that the fossils have, in a measure, disappeared, leaving only obscure outlines on the weathered surface. Excepting in the upper strata next to the overlying slates, three or four species of coralines and a few small bivalves represent the auimal life of the period in which the limestones were formed. These shales or slates are all more or less bituminous, and in those places where they are not much broken or exposed to weathering, they contain enough hydrocarbon to burn with a bright flame when heated, until the inflammable gas is consumed. We thus see the carhoniferous rocks overlying and in contact with those of the Silurian age.

MECHANICAL DISPLACEMENTS.

It is unnecessary in this connection to discuss the causes that have produced the breaks in the original bedding of the secondary rocks, for the reason that there are too many theories conuected with this subject, and to many diverse opinions to be considered, that have no practical bearing upon the nature and extent of the ore deposits. Therefore in utilitarian sense, it does not matter whether the upheaval of one portion and the corresponding depression of other portions of the metal-bearing rocks, was produced by volcanic disturbances, earthquake convulsions, or by the corrugation of the outer crust of the globe from the general shrinkage of the interior mass. It is quite probable that the latter proposition—"the general shrinkage of the globe from loss of heat"—has been the cause—either directly or remotely—of all the volcanic and earthquake phenomena of ancient and modern times—such phenomena being the result simply of the operation of a universeal law.

THE METAL-BEARING STRATA.

The ore deposits are in what are called "coraline limestone," from the fact that coralines and a sea plant called the "Algae" are the fossils found imbedded in the silver bearing strata. Next above the silver bearing limestone is a bed of dark brown and pinkish-colored slate, with alternating strata of limestone of a later period, containing large numbers of "Encrinites," and a few "mollnsks."

This last described stratum of alate and limestone is not metal bearing, and ia tound only on a few isolated benches on the higher portions of the north end of Treasure Hill, and along the eastern base, extending in a curved line from the town of Hamilton, along the line of Applegarth Cañon, and in the southern foot-hills, south and east of the California mine.

TOPOGRAPHY AND STRATIGRAPHY OF TREASURE HILL.

The longitudinal axis of Treasnre Hill is in a line nearly north and south, and from Hamilton at the extreme north to the junction of Applegarth and Shermantown Cañons at the extreme south, the distance is about six miles. A line from east to west, through the widest part of the hill cutting to the South Aurora Mine, will measnre about two miles. The high crest of the hill is about one mile long, north and south, and averages abont 1,200 feet in altitude ahôve its base. This high crest forms an irregular sloping bench, highest along the east side, and sloping irregularly westward.

For convenience, we will call this the upper plateau of Treasure Hill. It includes Pogonip, Chloride and Bromide Flats skirting its western slope, and the celebrated Aurora, Hidden Treasnre, and other important mines along the higher and more easterly portions, near the summit of the ridge. The eastern edge of this plateau is very ahrupt and precipitous, and appears to be the great line of disruption or displacement of the limestone strata. From this line of fracture the limestone dips westerly at an angle varying from ten to twenty degrees.

The east side of the hill presents bold cliffs, showing the east edges of the lime strata for several hundred feet down the hill. At the foot of these cliffs the strata corresponding with that on the "Upper Plateau" is found dipping to the east under Applegarth Cañon.

EAST AND WEST FISSURES.

At the south end of the "Upper Platean" there is a great tranverse fissure, extending entirely through the mountain, in an irregular line from east to west. This I will call the "Eberhardt Fissure," from the fact that the great Eberhardt deposit is in the central portion of this line of displacement. South of this break the lime strata dip generally in a southerly direction until they disappear under the debris of the foot-hills.

These are the two most prominent and well marked lines of displacement in the hill, and are a key to all the others, since nearly all the other lines of fracture and displacement connect immediately or remotely with them.

South of the Eberhardt fissure the hill is broken into a number of divisions by well marked lines of fracture and displacement, the greater number running in a south and southeasterly direction, and are now marked by the ravines and cañons that have formed along their lines. (I will here remark that every ravine and cañon in this district is formed in a line of fracture in the country rock for at least the greater part of its length.)

The distribution of fractures south of the Eberhardt fissure cuts the southern part of the mountain into a series of irregular ridges, varying in their direction from south to southeast.

Across these ridges there are a few fissures nearly parallel with the Eberhardt, and presenting, to some extent, the same general features. The California mine approaches nearer in structure and general character to the Eberhardt than any yet found in the district; with this difference, however,—the south wall of the California has been in the line of displacement, is smooth and well marked, whilst at the Eberhardt the north wall has been the line of movement, and is equally smooth and well marked. This difference is merely mechanical and does not affect the general similarity of the two mines. The Eberhardt and California mines are not only in lines of fissures east and west, but are also lines of vertical displacement of the strata. The Irvine mine is in a vertical fissure, nearly east and west, in which no material displacement of the strata or bedding of the limestone has occurred. Other fissures of the latter type are to be seen in Treasure Hill and other portions of the district.

LIMESTONE BRECCIA.

The system of east and west fissures above described constitutes one of the well marked features of the district, and for convenience I will call it the "east and west system."

The peculiar features of this system are that they are filled, first, by broken fragments of limestone, of all shapes and sizes, from minute fragments to enormous boulders, occupying the entire space between the walls, thus forming a "breccia" of limestone, in the interstices of which, the quartz, spar, and ore, have snbsequently been deposited from solutions containing those minerals and metals in their various combinations.

VEIN CHEMISTRY—"TRUE" FISSURES.

In many places the "solfataric action" has been so intense as to dissolve the lime and deposit silica in its place, thus changing the small fragments of limestone into quartz, and in some instances leaving the form of the fossils as perfect in the quartz aa they were in the original limestone. Nearly all the quartz associated with the ores of this district has been formed in this manner, and, hence, is silicified limeatone, changed by the same process that in other localities has changed wood into silica, by dissolving the wood and depositing silica in its place, retaining in that case the structure of the grain of the wood. In the transformation of the limestone here the forms of the fossils are equally well preserved. Hence, the the vein matter filling the true fissures of this district is so different from that observed in other parts of the world that mining experts have generally asserted that "there are no true fissure veins here." I think otherwise; but, as that depends somewhat upon what a "true fissure vein" is defined to be, I will leave it for future discussion.

THE HORIZONTAL DEPOSITS.

The next class of ore deposits is those lying with or between the bedding of the limestone, in irregular masses or bunches, of all sizes and shapes, from a few pounds to hundreds of tons. These deposits are in no sense true veins, but are intercalated masses of ore in and between the limestone strata. Chloride Flat is a complete representative of this type of deposits. The chemical reactions, however, have been the same during the formation of these "ore beds" as that described in connection with the filling of the true fissures.

NORTH AND SOUTH ORE CHANNELS—GENERAL LINES OF BREAKAGE.

A third class of ore deposits is also well marked throughout the district, that partakes largely of the character of both those above described. They are neither "true fissures" nor "intercalated deposits," but are mainly on lines of break, running north and south through the central portions of the district, in which no material displacement or faulting of the strata has occurred. The limestone appears to have been crushed and broken into fragments to unknown depths, and in some places to great width. The finest example of this class is the Aurora Mine, near the summit of Treasure Hill, opposite and east of Chloride Flat. The crushed or broken limestone has become a great mass of silver ore by the same process as that already described, viz: chemical changes, induced by the ascent of heated vapors and gases through the rents and breaks of the outer crust. This action also spread laterally into and through those strata that were most permeable and soluble; thus changing the limestones, in those places where the mechanical and chemical action could operate under the most favorable conditions, into quartz, spar and ore, as we now find it.

The Mahogany series of claims, including the Blair and Banner, are all located on a great deposit of ore belonging to the class of mines of which the Aurora is the representative. This body of ore lies in a basin, along the upper part of Mahogany Cañon, and is traceable about 1,000 feet in length by from 100 to 200 feet in width, and judging from the character of the vertical breaks, there is every probability of its continuance to great depth. I do not wish to to be understood to say that the whole area of 1,000 feet north and south by 200 feet wide is all one continuous mass of ore, but that it is a mass of broken limestone, with large deposits of ore ramifying it, in the same way that it is seen in the Aurora and other mines of the same class. It is, properly speaking, all one great mine or deposit of ore found in a general line of breakage of the lime-strata. The bedding of the limestone along this line of break does not appear to be displaced or faulted, but is depressed along the central line of break—and hence the dip of the strata on each side of the break is towards the central line, occupied by the bottom of the

ravine or cañon, forming a trough like a flat V.

The superficial character of the explorations along this "ore channel" can only give a general idea of its extent and value. But it is sufficiently well marked to make it one of the most promising localities in the district, and unless my generalizations are very wide of the truth, it *ought* to be one of the most extensive and valuable mines in this famous and anomalous country.

LOW GRADE AND QUANTITY.

This class of ore deposits appears to be the most extensive and reliable for quantity. The ore is lower grade than either of the other classes of mines described, but there is more of it in one body, consequently involving a less amount of dead work to get it out, and making the permanent improvements incident to large mining operations more valuable from their useful continuance through a longer period of time.

Large deposits of low grade or medium class ores *are always more reliable for continual and remunerative results* than small veins of very rich ore.

The only safe rule in any mining enterprise is to base the estimates upon the average value of the low grade ore, for they comprise the great bulk of all important mines, and if the plan of operations is so arranged as to work the poor ores with profit, there is no danger of the rich deposits marring the success of the enterprise.

BASE METAL RANGE.

The foregoing description of mines is confined to that portion of White Pine district occupied by Treasure Hill and its outlying spurs and foot-hills. The White Pine mountain proper lies west of Treasure Hill, and is separated from it by Silver Cañon. The "Base Metal Range," as it is called here, extends through White Pine mountain from north to south, a distance of six or eight miles, and numerous locations are made on both the east and west flanks of the range. A belt of the base ores is also found along the west base of Treasure Hill range, near the line of Silver Cañon.

Owing to the great amount of snow covering the range, I have not been able to make a satisfactory examination of the mines or the geological structure of the country rock. The ores contain lead, copper, antimony and silver, and are classed as "smelting ores."

As soon as the snows and my numerous engagements permit, I will give such facts to the public, through your valuable journal, in relation to the Base Metal Range of White Pine, as may appear to be of general interest.

Treasure City, April 28th, 1869.

GOVERNMENT EXPLORING AND SCIENTIFIC REPORTS.—The Pacific Railroad Reports are now held at a high price, a complete set for sale in this city being offered at $100—consisting of 13 volumes, which includes a few volumes of naval exploring expeditions. Many of these scientific reports are necessarily superficial, and even incorrect, owing to the hasty manner in which our great interior had to be reconnoitred; but they are all we possess in regard to sections of country that we see at the present time rising out of the ocean of the unknown and undeveloped past, into islands, promontories, headlands and aggregating continents of civilization. To the intelligent and scientific reader the materials are, in this shape, presented for a very fair appreciation of the resources of the great West. With Whitney's available California notes, the Ross Browne and Raymond contributions, and the newly operating King Pacific Railroad geological reports, Blake's Paris Exposition reports, Stretch, Sutro, White, Laur, Hayden, etc., we shall not lack for information of the official sort. In regard to the King survey, the first volumes of which are now in press at Washington, we see it reported that an additional appropriation of $120,000, has been made by Congress; which is probably intended to complete it, the originally intended duration having been but three years. It is under the auspices of General Humphreys, of the United States Engineer Corps.

FIRST OVERLAND FREIGHT.—Macondray & Co., of this city, sent an invoice of tea to a St. Louis house by the first overland freight train.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, May 15, 1869.

City Stocks.

City stocks, as a general thing, are in better request, showing an increased amount of sales during the period under review. Insurance stocks have not been offered very freely of late, and upon the whole the inquiry for this class of securities is not urgent. Very considerable sales of San Francisco Gas Co. stock have been made at $81@82 50. This improvement is principally due to the withdrawal of the City Gas Company, recently incorporated, consequent upon the renewal for a term of years, by the Board of Supervisors with the San Francisco Gas Co., of the contract to supply the city with gas. Spring Valley Water Co. stock sold at $66 50@66 25 per share. The annual meeting of stockholders will be held on Saturday, June 19th. A few shares of California Steam Navigation Co. realized 65 per cent. The annual meeting of this company will take place on Monday, the 24th instant. The Omnibus Railroad Company will disburse its annual monthly dividend to-day. The Bank of Stockton disburses a dividend of 1 per cent. for the month of April. The Board of Directors of the California Insurance Co. have called a special meeting of the stockholders, to be held on the 16th of June next, for the purpose of considering the following propositions: to increase the capital stock from $200,000 to $300,000, and to change the value of shares from 200 at $1,000 each to 300 at $1,000 each. The California Steam Navigation Co. will disburse a dividend of 1 per cent. for the month of April to-day.

The Bank of California disburses its usual monthly dividend to-day.

Mining Share Market.

The result of the week's transactions in the stock market showa a pretty large amount of business distributed among a more than usual number of companies comprising the list of the Board, and in the main showing a very healthy advance in prices. The Nevada mines in general have received a very marked impetus through the various railroads, both completed and in prospective, and by these conveniences the mines acquire additional value, independent of their intrinsic merits as regards the production of bullion. With regard to the Gold Hill mines we notice a material improvement in prices. A dispatch of the 13th says: "The shafts of the Crown Point and Kentuck still remain closed; but there are no indications of fire, and it is hoped it is extinguished. The Crown Point is putting in new cylinders to their hoisting works, and the Kentuck Company are putting on new cables, preparatory to commencing work in a few days."

ALPHA—improved from $32 50 to $39 50, closing at $35 50. On the 11th inst. the cross-cut on the 1030 level had been carried a distance of 21 feet, showing porphyry with quartz seams in all directions. A boulder, weighing some five hundred pounds and containing some pay quartz, was encountered, but no other quartz of a similar character has yet been found. The drift will have to be run some 30 or 40 feet more before they will reach the east clay. On the 930 level the ore streak is reported to be looking better, being three feet wide and showing an average assay of $61 per ton.

BELCHER—advanced from $18 50 to $23, and closed at $22 50. A bullion product of $8,280 25 from 357 tons, equal to $23 18 per ton, is reported for the month of April.....CHOLLAR-POTOSI sold to a moderate amount within a range of $238@252 50, and closed at $255. During the week ending May 7th 1,240 tons of ore were extracted, and 1,269 were sent to the mills during the same period. The Blue Wing stope is reported to look quite as promising as it did a week ago, and the western portion is improving as the work is carried up. A drift from Potosi tunnel level will be run west to intersect the new tunnel body, giving a depth of 200 feet to that deposit. The new tunnel stope is not looking as well as formerly. The bullion returns for the month of April aggregate $122,592 76, against $110,392 in March.

GOULD & CURRY—sold to a considerable extent at $111 @120, closing at $121. This company will soon run a prospecting tunnel into the croppings west to the El Dorado cross, which will be about 400 feet long. The shaft is being thoroughly repaired at the bottom, and we understand that at an early day they will ent out a station and commence drifting.....HALE & NORCROSS—sold at $175@200, closing at $180. During the week ending May 8th 757½ tons of ore were extracted, showing an assay value of $47,309 53, that from the fifth level showing an average of nearly $100 per ton. In the same time they delivered 1,005 tons of ore to the mills, leaving on hand 923 tons. The fifth station continues to look exceedingly well, the ore showing a width of 31 feet, and is widening as they are going down on it....IMPERIAL—has improved considerably. On the 13th inst. $2,590 in bullion was sent forward from the Gold Hill mill. Finding nothing but barren quartz and porphyry in their lowest levels in the Imperial-Empire shaft, it has been decided to commence immediately to carry the shaft to a greater depth.

SAVAGE—fluctuated considerably under large sales. The yield of bullion for the month of April aggregates $173,900, against $173,817 in March.....GOLD HILL QUARTZ yielded $4,969 in bullion during April, against $5,676 in March. An assessment of $20 per share was levied on the 13th inst.

In reference to the White Pine mining district we clip the following from a correspondent of the *Bulletin*, of this city: "Treasure City and district are rapidly improving in all things which look toward permanency. The six-horse coaches now arrive and depart from here, and the toll roads are completed to here from Hamilton and Shermantown. Three new water carts made their appearance on our streets this week with spring water, and the price is reduced to eight cents per gallon. One was a large tank, drawn by six horses. Prior to the introduction of these we were dependent on snow water. The warm weather scattered this article, and only left a few banks on the north side of the hills and bluffs. A number of prospectors who, I suppose, had been unsuccessful in finding chloride, changed their base of operations and located the snow banks, with all their dips and angles, and threw up a snow wall around them. One of these snow locations sold last week for $600 gold coin. The lucky purchaser is melting it down and selling it for two bits a bucket. He has already realized the sum paid, and has quite a fort left. Wood has fallen from $20 to $15; barley from $30 a hundred to $10; flour from $16 to $8; potatoes from $40 to $6 per hundred pounds; eggs from $2 per dozen to 50 cents, and other provisions in about the same ratio. Freight is reduced from 20 cents from Elko to 6 cents. Lumber has tumbled from $400 to $200 per M, and is still on the decline. Over twenty new stores have been opened since my last letter. Each new one is enabled to sell at a lower rate than his neighbors, which compels the old houses to come down, at a great sacrifice on many articles.

"Information has been received here from reliable authority that correspondents of a few shaky papers have been employed and sent here by parties interested in other districts to write down the mines and resources of this district, but it will have only a temporary effect. The richest and most extensive mines of the world are here. They are easily worked. The ore is easily reduced, and the process of reduction is simple and cheap. This district is now producing, with only 33 stamps in active operation, $500,000 a month in bullion. I have heard an estimate made by more than twenty experienced miners and old men, that there are over 30,000 tons of ore lying on dumps and stored away on and around Treasure Hill alone, which will average $100 per ton. This will yield $3,000,000 as soon as we have mills to reduce it. When you consider that the weather has been too severe for men to work more than half their time, and ill provided against the snows and storms, with a small number of laborers who were content to work for day's wages, the product of silver is almost nothing in comparison with what it will be this summer and fall, when the weather is pleasant, mills sufficient to crush the ore, labor abundant and cheap, and supplies reasonable in price. No mining district in the world possesses so many natural advantages as White Pine. The mines can be worked to a depth of a thousand feet without striking water. Wood will not exceed $4 per cord for the next five years. The ore can be extracted from the mines, hauled to the mills and crushed for $15 per ton so soon as mills are plenty and the business of the district is settled upon an economical basis. It seems incredible that man's self-interest would carry him so far as to malign the facts and resources of a new district, while the rich developments stare him in the face. Croakers may howl, other districts may writhe over their declining fortunes and depopulating towns, bought brains may conjure up false reports and send them forth to the world, they cannot change the silver mountains of White Pine. Though base their accounts, and dark their deeds, yet pure and bright will remain the silver stream which will flow like the torrents of a flood over the world. White Pioners read with indifference their letters and laugh at their misrepresentations. It is like the nibbling of a sandfly at the back of an elephant—it may draw a drop of blood to satisfy its satiated appetite, but the ponderous animal moves on, unmindful of its infinitesimal rider."

EBERHARDT MINE.—The name of this mine, says the *Inland Empire* of the 6th, has become familiar to every one in this district. It is not our intention to give a history of its discovery, nor to pass any eulogy upon it; but to give a plain statement of what we saw and what conclusions we arrived at from a careful inspection of the mine. On Monday last, while musing the rounds of life in Virginia at Treasure Hill, we called at the Eberhardt and introduced ourself to Mr. Bicknell, the Superintendent, who kindly extended to us an invitation to go down into the mine, which was accepted. We were soon afterward at the first level of the mine. At this point the most of the ore which has been taken from the Eberhardt proper has come yet, in but one single place has it been opened larger than one floor with six-foot posts. At one point a space of ground of some ten feet square was excavated below the floor to a depth of ten feet. On the south side of the opening below the ore has been taken away from the south wall, leaving the wall perfectly defined and as smooth as any wall we ever saw in the Comstock. The wall rock is pure limestone, without a particle of quartz or spar in it, and almost perfectly solid. Next to the wall is a stratum of quartz a foot thick, which is ground almost as fine as though it had been subjected to the stamps of a mill. Joined on to this is the rich chloride ore, of which none is being worked. The ore being reduced at this time is what is termed the black ore. Although it has not a favorable appearance to the inexperienced eye, yet it yields about $6,000 per ton by mill process. The ord in the mine seems to be divided into two classes—the black quartz and the chloride. In both kinds large boulders of barren rock, similar to the cap rock found over nearly all the ledges, are met with. We do not propose to give any kind of an idea of the richness of the chloride stratum, for we know it would prove a failure; and if we did succeed, our readers would think we were excited, if nothing more. But we should say there is now exposed to the eye at least three million dollars worth of ore. In some places there is "horn" silver two inches thick. Some ore was broken up from the floor of this station which was a perfect mass of "horn" silver. We were made the recipient of a piece of it weighing a little over a pound, which is worth $10 25. It is perfectly malleable. Although we have been through every level from the sage brush to 1,000-feet station of all the mines on the Comstock, and have seen them in their glory, yet we have never seen anything that would do to compare to this great mine. The rock wall is perfect, and is as true as the wall of a plastered room. Near the north wall a tunnel has been run west under the road a distance of two hundred feet, and the whole distance was through ore of a very high grade. The ledge of pay ore, or ore that will mill from $600 to $18,000 per ton, is 183 feet wide, and how deep it will extend no one can tell. We saw some good ore from the shaft at a depth of 184 feet, although the shaft is in the edge of the south wall; but as soon as a drift is started across the ledge we may look for ore equally as good as that found on the first level.

PLUMBAGO CRUCIBLES.—A very large assortment of plumbago crucibles, from the size of an assaying crucible to that of a small cupola furnace, may be seen at the store of A. S. Hallidie & Co., No. 519 Front street. They are what is known as the Morgan pateut, manufactured at Battersea, London, and are said to last longer than any others made. The Dixou crucibles, manufactured in New Jersey, aud the Morgan, together, mainly supply this field. The average durability of the Morgan crucihle for gold, silver, copper, and other ordinary metals, is forty to fifty pourings, in some cases reaching one hundred. For zinc they last longer than iron pots, and save the great loss which arises from mixture with iron. Those for maleable cast iron show an average working of seven days. The plumbago crucible is a most important article in modern metallurgy and metal working,—everything cast in a small way being now done with it as the most economical article to be had.

Weekly Shareholders' Directory, for Meetings, Assessments and Dividends.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

The Michigan.—*Chronicle*, May 1st: This tunnel is now in 245 feet, and running through easy rock. It is thought that 100 feet further will carry it to the Tarshish.

Arrived.—M. Schwerin, Agent of the Schenectady, (Tarshish), arrived on Monday. Mr. Graff, who formerly had charge of the work, has been sent for to act in the capacity of Mining Engineer, and in the mean time, commencing at once, the mine will be put in order and explorations continued.

Morning Star.—*Miner*, May 1st: The work at this mine is now penetrating beneath a body of ore preparatory to stoping out. The Co's affairs are said to be in a somewhat mixed state at present.

Monitor Consolidated Co.—The Mill is now all ready to commence grinding quartz, and it is thought the flume will be finished during the coming week.

The Globe.—The tunnel was pushed in 12 feet last week and is working well. Mr. J. Winchester, the president, is expected from New York.

AMADOR COUNTY.

Summit Mine.—*Ledger*, May 8th: Sinking and propecting is still going on. One hundred and fifty tons of rock were crushed a few days ago and the yield was $30 per ton.

The Amador Mine, at Sutter Creek, is at her old tricks again. For the month of March the yield of gold was $61,000, while that for the month of April was $66,000.

The Wolverine.—This mine is the first north of the Eureka. The owners lately struck a body of very good rock.

R. C. Downs, of Sutter Creek, has struck a large vein of quartz on the north extension of the old Union mine. The lode is about ten feet wide, and the rock of good quality.

CALAVERAS COUNTY.

The Palomo.—*Chronicle*, May 8th: The steam hoisting works are nearly completed. When they are ready to commence operations, the mine will be well supplied with machinery.

Petticoat.—This mine is entirely free of water and the main shaft is being sunk as rapidly as possible. No more levels will be run until the depth of 100 feet is reached below the old level.

Alexander & Co. still pursue the even tenor of their way. The clatter of their batteries ceases not, day or night.

INYO COUNTY.

Cerro Gordo.—April 25th: A correspondent of the *Alta* says, one of the richest discoveries ever made took place on the 22d. Mr. Elder, of the firm of Belshaw & Elder, discovered a piece of float, which he assayed, and it went over $10,000. The whole town turned out to look for the lead; next day it was found. The lucky individuals are General Heffernan, J. Simpson and Charles Hoffman. Robert Cushing, of San Francisco, is located in the ledge. It is called the General Rathbone ledge, and assays over $12,800 per ton. No ore is worked here that pays less than $200 per ton. We are greatly in need of capital and good miners.

Freiburg.—Same of 24th: A correspondent of the *Times*, says: Since opening, last September, there has been extracted about 987 tons, which assays from $100 to $300 per ton in silver, with an average force of three men, with no other assistance than pick, shovel, wheelbarrow and blast.

Alpha.—They have run a tunnel with the same force as that employed on the Freiburg, 200 feet, and had to stop by reason of scarcity of timber. Their prospects are flattering.

LASSEN COUNTY.

From the *Sage Brush*: We understand that a mining company, from Cherokee Flat, have recorded several locations on Susan River, twelve miles from this town. We have been informed that there are extensive gravel diggings, which prospect fairly.

Again in Operation.—*Gazette*, May 7th: The steam pump on the Mariposa Co's vein below town was again put in operation on Monday morning last. It suspended operations about two months ago on account of the supply of wood giving out, the roads being in such condition none could be hauled.

Hunter's Valley.—*Mail*, April 7th: The Oakes & Reese mine cleaned up on April 1st, [illegible] run of 27 days, $12,000; expenses, $7 [illegible] including some [illegible] ments. It is said the vein increases in richness the further down they go.

NEVADA COUNTY.

Clean Up.—Grass Valley *Union*, May 3d: The last clean up at Frank Morse's mill yielded over $1,900, exclusive of the sulphurets. This was the result of ten days' run with eight stamps. The mine is looking better than ever; some of the rock now being taken out will run $75 to the ton.

Wm. Penn.—5th: Work on the ledge is progressing favorably. The extensions east and west have been traced and located.

The Idaho last Monday declared a dividend of $15,500.

Allison Ranch.—The pumping is going ahead in a satisfactory manner, and the old dump is paying for the labor. The water has been lowered 130 feet.

Hope Gravel.—The company have some sixty feet yet to sink to gravel. The workmen are in pipe clay, and have some difficulty with water, which will be remedied as soon as the large pumps can be put to work.

The North Star continues to have good rock both in the east and west drifts. The west drift rock is very rich. The company will make a splendid clean up.

Union Hill.—6th: The amount of gold taken out for the month was something over $8,000. This does not include the sulphurets. The total expense of the mine and mill for that time was less than $6,000. The ledge is looking well and is over three feet thick in the east drift, and about two feet in the west.

Scandinavian.—*Gazette*, May 4th: The owners of this mine are working it by two arastras, run by water-power. A few days since they cleaned up, after a ten days' run, and took out $400.

The Monitor.—5th: This is an old location, near Guscetti's ranch. Its present owners, Cashin, Ott, Colley and others, have commenced sinking on the old incline, now down about 35 feet. They have pumping and hoisting machinery driven by water. Rock from this mine, several years ago, yielded $68 a ton.

Scotch Flat.—The claims of the Bean Co. were cleaned up on Saturday after a run of ten days, and yielded over $400. This was the first clean up this season.

Good Rock.—Alex. Young & Co. have struck a quartz ledge near the Havens Ranch, two miles east of Grass Valley. They have sunk an incline 30 feet, the ledge being of good size, the rock showing free gold and rich sulphurets.

Scandinavian.—7th: This company have levied an assessment of $5 per share on the capital stock, for building a 5-stamp mill.

Small Oaks Mine.—This claim is near the Ione, on the Colfax road, and consists of 950 feet. It is an extension of the John Bright, from which rock now pays $30 per ton. They have driven a tunnel over 300 feet into the ledge, which looks well, and is from eight inches to a foot in thickness.

Miners' League.—*Transcript*, 8th: The miners of Grass Valley and vicinity, opposed to Giant Powder, on the ground of injury to health, propose to form a miners' league, and at an informal meeting elected Capt. Faull, Correspondent, and Frederick Mason, Secretary.

Sweetland.—9th: The claims of Stidger, Evans & Co. are paying big. The company own acres of ground, and it will take many years to work it out....A Chinese Company of San Francisco have recently bought the claims of John Taylor.

PLACER COUNTY.

Heavy Clean Up.—Auburn *Herald*, May 8th: Heenan, Lowry, Taylor, Quick & Co., located a quartz claim on Rock Creek, three miles from here, and named it the Evening Star. Some days ago they had 13 tons of rock crushed, which cleaned up $3,333.18 in gold—an average of $256 per ton. There has been very rich surface diggings in this Rock Creek District, which have been and are still being worked.

Black Lead.—We learn that the boys have again commenced work. About a year ago this claim was reputed as being one of the richest in this section, but the pay streak pinched out.

Stars and Stripes, May 6th: Some very fine gold-bearing quartz has been taken from a ledge on the Bloomer Ranch.

PLUMAS COUNTY.

Morristown Union.—La Porte *Union:* We are informed that work is going on finely. One company made a small clean up last week.

Port Wine.—The Monte Christo cleaned up $3,580 last week, paid all back wages, and declared a dividend. The Union Co. also made a clean up of $2,500.

Nelson.—Fell & Co. are still at work on the bench above the bridge, and getting good pay. Several Chinese companies are at work in this vicinity.

[illegible] at Saw Pit have plenty o water, and all of the claims are paying. The Buckeye Co. have struck rick gravel near the Monitor. The American on Washington Hill has worked out all the ground they can through the tunnel, but men will be kept at work running a new tunnel to tap their upper ground, which is known to be very rich.

Quincy.—Barker and Wilhur have consolidated their claims on Mill Creek, and are taking out big pay. Swan has commenced cleaning up with good prospects. Mr. Dodge has purchased an interest in the Bull claims on the creek below the New England ranch. Haun has commenced work in the Ellis tunnel at the mouth of Arkansas. Hersey has struck a good streak on Hungarian. The boys on Clearmont think the indications for their striking the lead soon are excellent. The Black Hawkers are making the best use of their time and water, as the season will be a short one; the same may be said of the Hungarian and Spanish Ranch miners. Goodwin has sold out his claims at Elizabethtown, and Loring and Cummings are working them and getting good pay. J. W. Deuslar is having his Argentine claims worked.

SIERRA COUNTY.

Good Clean Up.—Downieville *Messenger*, May 8th: We understand that the recent clean up at the Keystone mill, owned by H. Scammon & Co., yielded over $16,000. This is said to be the best run ever made by this mill.

SISKIYOU COUNTY.

Quartz.—Yreka *Union*, May 8th: Mr. H. T. Shepard showed us some fine specimens of gold-bearing quartz, from a ledge in the vicinity of Oro Fino. The ledge is a foot in thickness at the surface.

TRINITY COUNTY.

Weaver Creek.—*Journal*, May 8th: The flume is progressing. A check dam has been put in 250 yards above the head of the flume, to hold the tailings while the creek is being sluiced below. It is the intention to put in sixty more boxes this summer.

Pony Creek.—Keach & Mason have taken a good deal of money out of their claims on Pony Creek, this winter. Keach lately bought out Mason and now owns the whole. One-fourth interest in the Portuguese claim on the same creek was recently sold for $600.

ARIZONA.

Bully Bueno.—Prescott *Miner*, April 17th: Mr. Vickroy has not been successful in his efforts to instill new life into the Philadelphia owners, and it may be a long time before anything is done with their property in Turkey Creek district.

Sterling.—A cut across the vein has disclosed an almost solid body of quartz, 17 feet thick. Thousands of tons of rich ore are now in sight.

Big Bug.—The German Co. have had to suspend operations until more water comes. ....The companies at work in the vicinity of Gray & Co's mill, are said to be making about $6 per day.

Black Canon.—The few miners there are doing well.

Arizona City.—At a little town called Los Angeles, 18 miles above Fort Yuma, Mr. Wakefield and others are working deep placer diggings, and they are paying well.

BRITISH COLUMBIA.

Cariboo.—*British Colonist:* At Perry Creek, 26 companies were at work at date doing well. The Shaw Co. struck a nugget worth $80; Downey Co., a $28 piece. The following companies for three days previous: Downey, 50 oz.; Montgomery averaged 10 ounces per day; the Jewelers' Shop, $128 per share for three days' work; Price, $120 per share in same time; and others from an ounce per day up. Number of shafts were being sunk, none had struck bedrock, although a depth of 38 feet had been attained.....On Wild Horse Creek the miners were making preparations.

Rock Creek.—The Flume Co. were at work, having reached their new ground.

William Creek.—The mining prospects were improving, and the general feeling was one of confidence in the approaching season.....The Barker Co. last week washed 96 oz.; Cariboo, 72 oz.; Canadian, 43 oz.; Baldhead, 40 oz.; Caledonia, 40 oz.

Stout's Gulch.—Coombs Co. washed 80 oz. All the other companies getting ready to work when the water increases.

Conklin's Gulch.—Renfrew Co. washed 60 oz; Eclipse Co. have just got their tunnel into their own ground, but have not got ready to work from it yet.

Mosquito Creek.—As the waters improve so do the prospects of this creek. The Minnehaha last week had 174 oz.; the Willow and Tabb are just commencing to work. Tom and Jerry, on Red Gulch, putting in machinery.

[illegible] Creek.—The Discovery Co. continue running their tunnel, and are making small wages as they go on.

COLORADO.

Baker S. M. Co.—*Georgetown Miner*, April 22d:—The air shaft between the 2d and 3d levels is completed. A large contract for stoping has been let, and 30 men will soon be at work, night and day, taking out ore. The road from the mill to the mine will soon be opened.

Rip Van Winkle.—There is great excitement on Brown Mountain about this new discovery. It was struck at a depth of 70 feet from the surface in running a crosscut. There is one foot of solid argentiferous galena, showing brittle silver in the vein. Hon. Carver J. Goss is the fortunate owner.

Terrible.—The air compressers and engine have arrived and are being placed in position.

Bullion report of Huepeden & Co. this week, 2518.45 ounces, coin value $2140.25. This company keep pounding away night and day. A full supply of ore is coming in constantly.

Quaker.—The shaft is down 70 feet. A contract has been let to sink 50 feet. The crevice is 3½ feet wide, showing a large pay streak. About 10 tons of first-class ore are at the mouth of the shaft. First-class ore assays from 100 to 500 ounces to the ton. Beautiful specimens of brittle silver are found.

Large Mass of Silver.—We saw at the banking house of George T. Clark & Co., a huge mass of silver from the Brown Company Smelting Works, weighing 560 lbs. Troy; value in greenbacks, $11,000, the product of 33 tons of ore from the Brown and Coin.

The dressing works of the Wilson & Cass are enclosed and a large portion of the machinery on the ground. The mill will be completed by the first of June.

Judge Dickerson, of Black Hawk, is erecting a mill on Chicago Creek for the reduction of silver ores.

Snake River.—John Reynolds informs us that they have struck it rich and large on the Comstock. They are taking out huge blocks of solid ore, spattered all over with ruby silver....The Potosi has been struck two hundred feet deep in Capt. Slawson's tunnel, showing a crevice of twelve feet between walls.....The Guibar extension of the Potosi has been sold for a round price....Black & Milner are taking out ore in large quantities from the Monte Christo. This is a large lode, supposed to be an "extension" of the "Suky."

Boulder City *Pioneer*, April 21st:—The Ni-Wot mill and mine have entered upon a season of active work. The property of the company, worth one hundred and fifty thousand dollars, was sold by sheriff last week for five thousand dollars, to satisfy a claim of Hussey & Co. The plaintiffs have agreed to restore the same to the company if the latter will liquidate the claim, including all expenses, within fifteen days. Mr. Pomeroy has gone east to get the company to accede to these terms. In the meantime, Messrs. Breath and Grose have a lease from Hussey & Co. A force of 30 men is now at work. In Wyoming and Snowy Range districts there is but little doing. There are a few prospectors, but no preparations have been made for any extensive development. Some of the most promising surface indications for silver in Colorado are in these districts.

Clear Creek.—Central City *Herald*, April 28th:—Charles Bangs has quit working his lodes on Chicago Creek until the summer rains are over. Meantime, he has gone to work on Montgomery bar. Mr. Bangs intends to cut a bed-rock ditch about 700 feet long, which will obviate the necessity of pumping. There will be more mining done on the Creek this season than ever since 1861. The old Grass Valley company has been brought to life, and will go to work again. There are about 25 men working on the head of Chicago Creek, Cascade district, who believe they have first-class silver lodes. From assays of specimens, we feel confident that the district will prove good. There will be a good chance for prospectors there when the weather settles. Abundance of good timber and fuel is found in the vicinity, and the water power cannot be excelled in the Territory.

Brown.—J. W. Watson, Supt. of the Brown works, Clear Creek, will in a few days begin making another button of silver, which will probably be larger than the last, the largest ever made in America.

Mr. Conlee has found a large body of seven ounce ore in the Gilpin mine. He has been working on three ounce ore for a long time, and now finds that the larger vein was missed in sinking.

Sale of Mining Property.—E. D. Fritts has sold an undivided two-thirds interest in 1,400 feet on the O. K No. 2 lode. Also,

two-thirds interest in 1,400 feet on the Washington lode, Gregory district, Gilpin county. Ore from these lodes have yielded in a stamp mill, six ounces per cord. The price paid for the property is $13,333.

BRIGGS.—Choice ore from the Briggs mine is worth $1000 per cord. The fifty-stamp mill is kept constantly supplied, and the mine promises to keep this up all summer.

Robert Teats is getting some remarkably rich silver ore from his mine. We saw a specimen which was literally crammed with native silver. The mill is now in good repair, running up to its full capacity.

We saw some specimens from a new discovery this morning, which were worth their weight in coin. The specimens were nearly solid gold, and the quartz being pure white, they are the most beautiful we have ever seen.

Truman Whitcomb's mill never stops. He is fixing some pans for running tailings. The stamps are now crushing ore from the Forks and doing well.

The dispute on the Creighton and Shaffer No. 1 lodes has been adjusted. Van Camp & Tuttle have given the Shaffer party all the gold taken from the mine, with the exception of about one hundred dollars. About sixteen cords of ore was taken from the mine by the Shaffer party, which is reported to have yielded at least $2,000. Van Camp & Tuttle will continue to work the property.

Van Camp & Co. are raising a cord and a half of pay material per day, from the Creighton lode. We understand that it runs 14 ounces gold per cord.

CASH CREEK.—Denver *News*, April 21: Active mining operations have commenced throughout the neighborhood. The big fluming company will begin work next week. Prospects are encouraging.

IDAHO.

GRANITE CREEK.—Idaho *World*, April 20th: The sale of the Brainard claim, was not consummated. An offer of $50,000 for a claim of 1,800 feet, near by, owned by some Frenchmen, has been refused. The ground sluicing claims in the creek have been opened, and each promises to yield good pay. Ellis, Devine & Co. are running their claims and ditches day and night. Times are growing brighter.

IDAHO CITY.—The claims on Moore Creek, from town to above Walla Walla Flat, are actively worked, and between 300 and 400 Chinamen are employed. A number of white miners are at work here and there with rockers, and make first-rate wages. Across the creek the hydraulic claim of Meredith & White is running, and down the creek, below the mouth of Elk, there are several hydraulics in full play, besides those of Elkins, Wood, Saunders, Noble & Co., on Bonum Hill and along Buena Vista Bar. Gold dust is coming in, and trade is reviving....Reuh. Peyton showed us the gold product of quartz from a ledge near Granite Creek, less than a pound; the yield was $22.

IDA ELMORE.—Silver City *Tidal Wave*, May 4th: The Co's mill—the Lincoln—steamed up yesterday, after a resting spell during the breaking up of the road to the mine.

MONTANA.

I. X. L. MILL.—Helena *Herald*, April 27th: J. C. Ricker, of the I. X. L. Mill, from a week's run on ore from his claim on the Union No. 2, brought to town this morning another of those nuggets of gold retort, which pulls down 418 ounces and bears a currency value of about $10,000.

Dr. Tiernan informs us that in consequence of the owners of the big ditch, at Gold Creek, raising the price of water to 50 cents per inch, the miners had become greatly exasperated, and on Saturday resolved to lay their claims over for one year, and allow no man to buy any water from the old ditch, but to go in together and build a ditch of their own.

NEVADA.

HUMBOLDT.

LITTLE GIANT.—*Register*, May 13th: We are informed by John Dryden, County Assessor, returned from Battle Mountain, that the average yield of the mine for the last quarter was $260 per ton; also, that there is sufficient ore of the same description, now in sight, to supply the mill for months.

NEW DISCOVERY.—Wiles and Henderson have discovered a ledge near the Alpha mine, in Echo District, which is reported as being exceedingly rich.

COPPER.—A large copper vein has recently been discovered in Gold Run District by Messrs. Montgomery and Winn, and has been found by assay to contain $75 per ton in silver.

REESE RIVER.

TWIN RIVER SILVER M. Co.—*Reveille*, May 4th: The property of this company, in Ophir Cañon, comprising the Murphy mine and hoisting works, a 20-stamp mill, offices, buildings, tools, supplies, land, etc., is advertised for sale.

HARDING AND DICKMAN.—7th: Five tons of ore just worked at the Manhattan mill, yielded by assay $973 per ton.

MANHATTAN.—Product for April: Number of tons of ore reduced, 532; bullion produced, 100 bars, weighing 9,358 pounds, and valued at $138,822 51 in coin. The average yield of the ore is about $263 per ton. The whole of the ore reduced was produced by the mines of Lander Hill, of which quite a number contributed small lots.

CHASE.—In the vertical shaft on the Chase mine in New York cañon, four miles north of this city, a vein was pierced a few days ago. This vein is 18 inches thick. An assay of the ore made yesterday yielded $210 of silver to the ton.

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

THE BURNING MINES.—*Enterprise*, May 4th: The shafts of the Crown Point and Kentuck have been closed, and steam will probably again be forced into them. The fire which has so long been smouldering in the depths of the mine was doubtless fanned into new life by the fresh air forced into the underground works by the blowers. Should there be no increase in the smoke in the Yellow Jacket, a full force of workmen will be put into that mine to-day.

IMPERIAL.—5th: It is proposed to run the drift at the 1,000-foot level further west. Only barren quartz and porphyry is found as yet in either that or the 1,100-foot level. From the old portion of the mine a daily yield of about 110 tons are obtained—80 tons of which are worked at the Rock Point mill, Carson River, and 30 tons at the Gold Hill mill.

GOULD & CURRY.—6th: The company are still sinking in their main shaft, and will probably not send off a drift until they have passed through the vein. The vein has a very promising appearance, and small bunches of ore are frequently met with....An assessment of $5 per share has been levied on the capital stock of the Belcher....The Hale & Norcross Co. have declared a dividend of $6 per share..... The Eureka Mining Co., on Cedar Hill, are taking out excellent ore. Their vein is not large, but in places very rich.

OPHIR.—7th: The drift west from the 700-foot level of the new shaft is now in 250 feet. The clay streak recently encountered is passed entirely through, and the face of the tunnel is now in hard gypsum rock. The surface at the level of the new shaft is 150 feet lower than the surface of the old one.

ALPHA.—Some rich streaks of ore are being found in the Alpha at the 900-foot level. As yet, no very considerable body of ore has been encountered, but several small and rich veins have been found north of the incline. One streak is yielding some five tons per day of fine ore.

ASSESSMENT.—An assessment of $20 per share has been levied on the capital stock of the Confidence mine.

BULLION.—8th: Yesterday we noticed four bars of silver bullion from the old North American mine, south of the Overman, at American Flat, valued at $8,616.33. This is the second lot of bullion from the mine since work was commenced.

THE BURNING MINE.—Gold Hill *News*, May 7th: A pungent, gaseous smoke still issues from the Crown Point shaft through the surface covering, inducing the belief that fire still exists. Both that and the Kentuck shafts continue closed as tightly as possible. The Yellow Jacket mine is free from unusual gas or smoke, all the drifts and other points of connection between it and the other two mines being effectually closed. A full force of miners are tumbling out the ore at a satisfactory rate.

SILVER CITY.—Cor. S. F. *Herald*, May 3d: The Twin mine is yielding at the present time only about $10,000 a month, but might be made to yield double that sum with a little more effort. We visited the mine on Saturday, passing through its various tunnels, drifts, shafts and inclines, in which we saw large quantities of ore, much of which will pay from $75 to $150 to the ton. On the 165-foot level the top of a new body of ore has been cut into, which gives $103 per ton by assay.

OCCIDENTAL MINE.—Letter from Gold Hill,—6th: There are vast quantities of ore now developed in the mine, and every foot in depth gained in the winze now being sunk from the old workings, to connect with the lower tunnel, is expected to cut the ledge in a short time, at an additional depth of 400 feet, is developing a higher grade of ore than any heretofore found in the mine.

[See Page 319 for continuation of Mining Summary.]

White Pine Summary.

The *News*, of May 1st, has an editorial upon "the situation" at White Pine. It calls attention to the fact that prejudiced letter-writers have failed to depopulate the district; and gives the probable reasons for such prejudice. We quote a sentence or two which express, in an emphatic manner, the editor's own opinion of the region:

"We have examined the mines of White Pine pretty thoroughly, and having had long experience in silver mining, have no hesitation in saying that, for richness of ore, size and number of well defined ledges, and extent of area covered by the compact mineral belt, White Pine Mining District has no equal recorded in history. * * As soon as milling facilities can be had there will be in White Pine ten dividend paying mines to every one in any other district in the State, and our bullion shipment for 1870 will fall little short of thirty millions."

TUNNELS.—*Empire*, April 30th: Treasure Hill will be prospected chiefly by tunnels. Some 20 companies for this purpose have been formed, some of which have already commenced operations. The Eastern Slope, running from the east side of the hill, opposite the Hidden Treasure, now in over 100 feet, in slate all the way, has been run at the small cost of $15 per foot.

The Sascatchewan, from the opposite side of the hill, is now in 135 feet—about 30 feet of which is in earth, costing $10 per foot, and balance in limestone, quartz and spar, costing about $30 per foot. This tunnel crossed a streak 20 feet wide of ore-bearing matter, the most it of a sufficiently high grade to pay for milling—a portion being extremely rich.

A little to the south of this tunnel is that of Chloride Flat Lode and Tunnel Co., now in some 50 feet. It is going straight under the richest portion of Chloride Flat, which it will penetrate at a depth of 100 feet.

WALLACE MINE.—This is three quarters of a mile east of the Eberhardt. The shaft is down six feet, and a piece of the ore from the bottom is good, exhibiting chloride in every part. The texture is the same as that of the ore of Treasure Hill. The ledge shows good rock the full width of the shaft (four feet). The Wallace is owned by a company composed exclusively of printers.

AURORA CONSOLIDATED.—May 1st: The ore shipped to McCone's mill will pay from $250 to $500 per ton. This Co. have out some 300 tons. Should it be necessary to take out 500 tons per day, they can do it with ease.

The Derby mine has a quantity of ore sacked and are constantly shipping. The ore is first-class. The Eclipse and Manhattan are taking out a large amount of first-class ore. All the claims we have mentioned are good mines, and will pay from $100 to $800 per ton.

CHARTER OAK.—The ore has yielded by assay at the rate of $3,000 per ton. About 50 tons of millable ore are now on the dump. It is slightly impregnated with base metals. The size of the lode has not yet been determined, though it is known to be at least 30 feet in thickness.

POCOTILLO.—From the shaft great masses of the richest gray chloride ores are being raised.

GOOD OMEN.—This mine is owned by parties from San José. They are taking out ore which pays from $1,000 to $1,200 per ton. There seems to be any quantity of it.

EBERHARDT.—*Empire*, 5th:—We visited this mine on Monday last. The ore being reduced at this time is what is termed the black ore; although it has not a favorable appearance to the inexperienced eye, it yields about $6,000 per ton by mill process. We do not propose to give an idea of the richness of the chloride stratum, for we know it would prove a failure. But we would say there is now exposed to the eye at least three million dollars' worth of ore. In some places there is "horn" silver two inches thick. We were made the recipient of a piece weighing a little over a pound, which is worth $10.25. It is perfectly malleable. Although we have been through every level from the sage-brush to 1,000-foot station of all the mines on the Comstock, and have seen them in their glory, yet we have never seen anything that would compare with this great mine. The ledge of ore that will mill from $600 to $18,000 per ton, is 183 feet wide, and how deep it extends, no one can tell. The mine at this time is employing but few men, and most of those are prospecting. Should it so happen at any time that this mine should desire to take out $500,000 in a single day, they can do so, and not employ more than half the number of men employed daily in the Savage mine. It is our honest conviction that the Eberhardt will in time yield more silver than has ever been taken from all the mines on the Comstock ledge.

We were shown a piece of ore in the hoisting works which was sewn up in a piece of green rawhide in order to keep it from being broken to pieces by visitors. The ore weighs 600 pounds, and $3,000 has been repeatedly offered for it, but refused.

FOGUS.—*News*, April 29th: A shaft fifty-five feet deep has been sunk, and a fine body of ore developed. The Excelsior, Little Bilk, Norfolk and Crown Point, all present indications of flattering character. Upon the Excelsior a large force are engaged, and fair grade chloride ore is being daily extracted.

STRIKE ON THE B. M. RANGE.—Same of 30th: We were yesterday shown some fine looking ore from the Chancer and Phillips mines, on the Base Metal Range. That from the Chancer, a ledge ten feet in width, is the finest looking surface ore we have seen in the District.

SAM SLICK.—May 1st: In this claim, west of the road to Hamilton and near the Fogus, some very fine ore has been developed.

HIDDEN TREASURE.—This mine is looking exceedingly well, and a large amount of excellent ore is being extracted daily. There are about fifteen men engaged. A shaft on the west side of the ledge is being sunk with dispatch. At a depth of forty feet a drift has been started east for the ledge, the west wall of which has already been cut, and a fine body of first-class ore developed.

ROSE BUD.—This is the name of a claim just below the Shermantown road, from which we have been shown excellent chloride ore. The ledge has been stripped fifty feet.

PLACER MINES.—At Elko there is a rumor afloat that rich Placer mines have been discovered somewhere within sixty miles of that place. Several parties had quietly taken their departure for the new mines, but none knew in what direction they went. A considerable quantity of gold dust, estimated to be worth $16 per ounce, is said to have been exhibited from the mines.

MILLS AND SMELTING WORKS—MCCONE'S MILL.—*News*, April 30th: The mill is now about complete and will be ready to steam up within the next few days. This mill has ten stamps, of seven hundred pounds each, and is capable of reducing about twenty tons of ore per day.

Same of 4th: The smelting furnace owned by J. J. Bassey, near Swansea, has made a second run on ore from the Base Metal Range. Three and a half tons were reduced, yielding about 600 pounds to the ton, valued at $227.40 per ton. The ledge is about 150 feet in width. The supply of ore appears to be inexhaustible, and we have no doubt the Base Metal Range will attract much attention on the part of capitalists within the next few months. In our judgement it is the finest field for prospecting anywhere in Eastern Nevada.

ANOTHER MILL.—Same of 4th: Captain Layne, Superintendent of the Hidden Treasure, informs us that a forty-stamp mill, formerly located at or near Lincoln, Placer county, California, has been purchased by the mine which he superintends and has been shipped here.

OUTSIDE DISTRICTS.—*News*, April 30th: Judge Rohadson has returned from a prospecting tour through Patterson, Snake, Shoshone and other districts to the south-east. A great many men are out in all directions prospecting, and a rumor has reached Patterson of a rich strike twelve miles south. Some important discoveries have been recently made in the Snake range, 25 miles to the eastward.

SACRAMENTO.—A correspondent of the *Empire* says: After a partial examination of some of the principal mines, among which may be named the Sacramento, Oro Fino, La Plata, Livingston and Lexington, I must say these are of themselves sufficient to warrant a population equal to that of White Pine district. Specimens have been shown me from the Golden Age, Antelope, San Antonio and Alpine ledges, that are bespecked with gold—the prominent metal of the district. This is situated about 90 miles from Hamilton in a southeasterly direction.

ROBINSON.—A letter to the *Alta*, from Mineral City, says: "There are about sixty ledges located within a radius of three miles, the ore from nearly all of which shows very rich. We have seen some 20 assays, varying from $75 to $273 per ton, with an average of over $50 in gold surface rock. The ledges are all well defined, running northeast and southwest. There is plenty of wood and an abundance of water in the immediate vicinity."

San Francisco:
Saturday Morning, May 15, 1869.

Notices to Correspondents.

J. D. T. DISTILLER, San Francisco, asks the following question: "What effect has a high altitude on liquors when weighed with a hydrometer, in comparison with the same strength of liquor in San Francisco? Liquor being at proof at the level of the sea, what would altitude have upon the hydrometer on the same day at 9000 feet—or at the summit of the Sierra Nevada on the Pacific Railroad?" Our correspondent has failed to point out the kind of hydrometer used or intended to be used. On this point we may observe generally, that a difference may exist, or these instruments may vary in their proportional expansive properties, accordingly as the variation of pressure may be between the level of the sea, and 9000 feet above it; and that of the liquid (of whatever kind that may be) under the same circumstances. If the expansibility were equal in the instruments and the liquid, no difference would be exhibited.

ANATOMIST, MURPHY'S.—In regard to the statements made of the human skull found in the gravel diggings in your vicinity, there does not appear to exist any reasonable objection to its authenticity. Sir Henry de la Beche, in his report on the Geology of Cornwall and Devon, mentions that several human skulls and works of art, buried in an estuary deposit, were found in mining gravel for tin, at Pentuan, the skulls lying at the depth of forty feet from the surface; and others were found at Carnon, at the depth of fifty-three feet. The over-lying strata were marine, containing sea-shells of living species and bones of whales, besides the remains of several living species of mammalia. Looking at the small breadth of country from which the debris could be derived which had covered these remains, and comparatively limited supply of aqueous fluid flowing from such small areas of watershed, it is by no means unreasonable to suppose that in an equal space of time twice, thrice or quadruple the quantity of debris might be deposited at the feet of our lofty Sierra Nevada.

PRO AND CON.—A paper on the Metalliferous Resources of Nevada, is received.

PAUL & WOON'S PROCESS.—The attention of the mining public is called to some certificates which appear in our advertising columns, in reference to the working of ores by the Paul & Wood electric process. We understand from Mr. A. B. Paul, who has just returned from the other side of the mountains, that this new process has been subjected to a thorough practical working test in a number of quartz mills in the interior, meeting with the approval of experienced millmen, and coming fully up to his own expectations.

Mining Statistics.

Some time in March last the report of the "Commissioner of Mining Statistics for the States and Territories west of the Rocky Mountains," made its appearance in Washington; but, so far as we have been able to learn, no copies of that public document have yet been received in California. A few days since, however, we incidentally learned that a very neatly bound *private* edition of the same was on sale at one of the bookstores in this city. Having procured a copy, a hasty examination enables us to say that the report, considering the time allowed for its preparation, contains a considerable amount of very presentable matter for Eastern readers, although we fail to notice much that is especially new to Californians. The book contains 256 pages, 96 of which are devoted to Nevada, only 24 to California, 39 to other mining sections, and the balance, some 100 pages, to the "Relations of Governments to Mining," and consists mainly of a rehearsal of the mining laws of various foreign countries, together with some deductions suggestive of a modification of our own legislative policy in this direction. On this subject the Commissioner says: "I think the true course is to alienate the mines from the United States as soon as possible."

He fails to see "any protection for permanent investment of capital" at White Pine, in consequence of the ill-digested character of the local mining laws of that district. He gives a very accurate though extremely brief description of the few mines particularly noticed in Nevada and California, several of which are illustrated with profile sketches. Although brief allusions are made thereto, he does not describe any of the processes employed in working ores, or offer any special suggestions as to improvement in this direction; and yet this is the only subject connected with such a report where there is much room for giving practical and valuable information. A chapter or two devoted to a comparative statement of the mechanical and metallurgical treatment of ores in Europe and on this coast, would, no doubt, have been read with much interest, and most likely with considerable profit, by persons engaged in mining operations here. The supposed intimate acquaintance of the Commissioner with European "processes," together with his "scientific and practical experience," had encouraged many on this coast to look especially for some important information in this particular. This desire seems to have been particularly warranted from the instructions of the Secretary of the Treasury addressed to the Commissioner before he entered upon his duties. We copy as follows:

The most important subjects for inquiry at present seem to be—

First.—As to the different processes of treating the ores, their chemical combinations, and the system demonstrated by practical experience to be the most successful.

Second.—The relative merits of the various inventions, machines, and mechanical contrivances, now in use or projected for the reduction of the precious metals, and for all other purposes connected with the business of mining and metallurgy.

No such instructions were issued to Mr. Browne, probably from the fact that he did not profess to have any practical knowledge upon the subject.

The third and fourth specialties in the "Letter of Instructions" relates to inquiries into the nature of the legislative action, which would be most beneficial to the mining interest, and to the propriety of establishing national institutions for the education of miners. Each of these secondary subjects of inquiry are fully discussed and with an ability which leads the reader to all the more regret that the primary and more important ones were not as fully considered.

We presume, however, that this report may be taken as merely preliminary in its nature, and that as the appropriation is continued, we may look for a full consideration, in the next report, of matters so vital and interesting to the mining public.

It may not be improper, in this connection, to refer to a matter which has caused no little remark here: Why it is that the Government should be to the expense of collecting and printing such a mass of information with regard to the mines of the Pacific Coast, and yet allow its agents to withhold the circulation of the printed documents from among those most interested in the information they may contain; or at least to manifest such an indifference thereto as to amount to the same thing. Of the many thousands of each of these documents which have been printed at the expense of the Government, those which have been seen in this State can be counted only by dozens, and even those have been obtained with much difficulty. The want is professedly supplied by individuals, who kindly volunteer to print and publish *private* editions of such documents, which are sold in the bookstores at good prices. We have no difficulty in obtaining a reasonable supply of other public documents of less value. Why should these mining statistics be made an exception? At this distance it looks very much as though somebody were attempting to make a speculation, at the expense of the Government if not of the people here. There seems to be a screw loose somewhere.

White Pine Progress—Ore Deposits, Stocks, and Mining.

Fair weather at Treasure Hill has had a moral influence, the effect of which is very perceptible, even at this distance, in everything that is said or done touching the mines and stocks of Treasure Hill. A new atmosphere of sentiment on the subject is beginning to prevail, which seems to us to be a decided improvement upon the sensational, unnatural condition,—so much resembling that of a patient laboring in a real fever, only that it has affected a community—which characterized White Pine during the stormy months of approaching spring. The mystery is clearing up. So much, concerning White Pine, has been "wonderful beyond conception;" it has figured so largely as the "poor man's paradise," and as "a mountain of solid silver;" as "different from anything ever known or heard of before," "the richest silver mine yet known or dreamt of in the world," that the MINING AND SCIENTIFIC PRESS felt justified in a little disapproval in noting the fact likewise pertaining thereunto that there were only twenty-five stamps at work, for so long a time, when it seems to us there certainly might have been more. We see less of the professional company-incorporators, of the go-betweens with shrewd ideas, who tackled returning White Pines and took them hob-nobbing with capitalists, of the wide-awake lawyers, all dealing with the fever-smitten. There is less mystery now, since the patient's pulse has improved. It was too evident that truth and information of the kind bearing upon permanency or the nature of the deposits, was not a leading article of demand during the loafing period when "everybody was on the sell," and when the striking of a band or discoloring of chloride of silver had the effect to put the work in abeyance. Quite naturally, the White Pine ore deposits, under circumstances so created, were "different from anything else ever known"—imagination of chloride scattered without method, and of chloride solid in the depths, being, for the time, the "*known*."

While nobody has been so stupid as to claim that Treasure Hill is not possessed of wonderful mines, it must be evident that defence of the loafing and selling-out policy that has been practiced in hundreds of mines, showing streaks and colors of chloride only, was the worst thing that could be said or done in favor of White Pine district.

It is becoming apparent that the only chloride mines on which money ought to be raised, are such as have proved, on continuing work, and by means of prospecting shafts, the existence of at least one continuous ore channel. The fact having become known that chloride traces can be found, and located gratis almost anywhere on Treasure Hill, the occupation of the company organizers who carried capitalists in their pockets is gone, and the demands of those enterprising moneyed men who lent their names as incorporators, are also likely to become more reasonable. Of the less speculative moneyed class, though they look on lovingly lingering near the bait, there are few so silly as to bite where the right kind of information is not ample and the proceedings above board. Millions of money are waiting to develop the new mines, provided only that tangible information and confirmation, after due lapse of time, be not withheld.

The richer mines appear to be working, now, principally for the wealth that they are able to take out. The Eberhardt is down 200 feet, and is reported to be a continuous vein. We see no reason whatever for doubting it. Touching the character of these ore deposits, we have published everything of a reliable nature or to the point, under that head, that has transpired. In so many months, there has indeed been very little. After our tracings of the points of similarity between Treasure Hill and Reveille, and Hot Creek districts, with the pipe and rake veins of Derbyshire, with the horizontal, and vertical, and diffused deposits of Chañarcillo, there came something more definite (if not too theoretical?) from Mr. Cadwalader; and to-day we take pleasure in calling the attention of our readers to what we deem to be the first clear, reliable, and satisfactory because indisputable account of the character of these ore deposits, that has yet been given to the public—we refer to the article by Mr. J. E. Clayton, on the fourth page.

It is not necessary to dispute about the arbitrary signification of a "true fissure" vein. The veins are there, both flat and vertical; and they go down as deep as veins do in general, whether they be entitled to a description as "true fissure veins," by reason of slickensides, selvage, or gouge, or of continuance in one general plane, or not. We must take them for what they are. The general characteristics of White Pine veins will be found to agree with the laws of vein deposits elsewhere. If there are peculiar local modifications, let us discover them, for the benefit of those who would proceed to their work with intelligence, and with the greatest possible degree of safety and economy.

A circumstance characteristic of White Pine veins which has confused many, though a very ordinary occurrence, shown in connection with every kind of metal mined, is the diffusion or ramification in bands and zones of ore traces in country rock. Every practical miner infers, however, that somewhere or other such ramifications must connect with larger ore channels, and if these are mere enlargements, or stockworks containing paying ore, while mining may prove exceedingly profitable on the "where it is, there it is" principle, it must necessarily be precarious. Ore channels develop into true fissure or fractured veins, stockworks, flat deposits, or anything else, depending mainly upon the conditions presented, mechanically and chemically, by the country rock, as one of the reagents on the fluids by whose favorable circumstances and affinities silver was concentrated in the spot.

CONTINENTAL Life Insurance Company, 203 Montgomery street, corner of Pine.

Treatise on Earthquake Dynamics and Earthquake Palliatives.

The first results following the appointment of a Committee on Earthquakes by the Chamber of Commerce of the city, have appeared, pursuant to announcement, in the form of a pamphlet, 8vo pp. 96, prepared by the late Secretary of that Committee, Thos. Rowlandson, Fellow of the Geological Society of London, etc., and published by Dewey & Co. Though not the regular and official report, which we understand from the preface is to be made up of individual contributions from members of the committee, the present work, being a compilation in part from Mallet's exhaustive treatise while it also gives the pith of other authorities on the subject, serves very appropriately as a fore-runner to the local working up which is promised us, from three or four of the leading members of the Earthquake Committee.

Rowlandson's new work comprises the following subjects: Earthquake Dynamics; Earthquake Waves; Sound that attends Shocks; Lime, Mortar, etc.; Cosmogony and Seismogony; Phenomena of the Neapolitan Earthquake of 1857; General Observations Respecting Structural Arrangements. The Table of Contents in detail will be found in our advertising columns.

At the annual meeting of the Chamber of Commerce, held on Tuesday evening, the President of that body stated that the present work, containing a large amount of valuable information on the subject of earthquakes, had been published under the auspices of several members of the Committee, and that an extensive report was being prepared by Mr. Gordon, which would, however, not be ready in less than about two months.

Besides giving precisely the kind of information that is most needed touching the present state of earthquake science, Rowlandson advances original and interesting ideas on the subject of cosmogony; and presents a chapter on mortar and bricks, a part of which will be found quoted in another column.

White Cloud, Neveda.

The interest in this new district is increasing. A stage has commenced running from Oreana, twenty-five miles distant, on the Central Pacific Railroad. Population is coming in, and preparations are being made for a town site at the mouth of the cañon, one and a half miles from the mining camp. A mule trail has been made in the cañon. It is the plan of the miners to extract the ore of the different ledges by shafts, they having confidence that the rock is rich enough from the top to transport and pay all expenses, after work is once fairly started. Several new ledges of a very promising character have been located during the past few days, among which are the Poorman and Moonta. The ores we have examined from this district seem to carry a large amount of mineral, copper greatly predominating in the croppings of some. As depth is reached on these ledges, if the copper metal gives way to the more precious ones, as is often the case, it must prove one of the very richest localities on the coast. Some industrious miners have the work of developing the mines in their hands. It is believed that the ore can be smelted on the ground and the bullion alone brought to this city for refining. Col. Bee reports, through the *Alta*, an assay of ore from the original White Cloud location of over $1,000 per ton in gold and silver.

Chicago has demanded space, we learn from the President, Mr. Hallidie, in the approaching Mechanics' Institute exhibition, which is to open in San Francisco on September 14th. Such a fact needs no comment.

Several interesting editorials already in type, are crowded out this week—including notice of Woodside's wagon wheel hub spring.

Treatise on Earthquake Dangers,

CAUSES AND PALLIATIVES,

BY

THOS. ROWLANDSON,

FELLOW OF THE GEOLOGICAL SOCIETY, LONDON, AND LATE SECRETARY OF THE JOINT COMMITTEE ON EARTHQUAKE TOPICS.

"Diseased nature oftentimes breaks forth
In strange eruptions; and the teeming earth
Is with a kind of colic pinch'd and vex'd,
By the imprisoning of unruly wind
Within her womb; which, for enlargement striving
Shakes the old beldame earth, and topples down
High tow'rs and moss-grown steeples."—(HENRY IV.

PAUL & WOOD'S ELECTRIC PROCESS.

SILVER CITY, (Nev.) May 5, 1869.

ALMARIN B. PAUL, Esq.—Dear Sir:—As you have requested that I should give my views as to the Paul & Wood Electric Process, now that I have tested it on a large scale, and whether your representations have been met with facts, I would state that in my former working of the ores from the Twin Mine, in this place, I was unable to procure not to exceed 60 per cent. of the metal I have now worked several lots through your barrel of 1,000 pounds at a charge, and find it works with as much perfectness as it does on your smaller scale in San Francisco. In one lot of five charges, of 1,000 pounds each, your returns were up to 93 36-100 per cent. based upon two assays of ore, after being pulverized, and by two different assayers.

I consider the system and barrel, as used, thoroughly practical for extensive working, and embodying a principle in disseminating the mercury through the ore obtained in no other mode of amalgamating.

I see no reason why you cannot assert your ability to work ordinary ores, after being properly pulverized, up to 90 per cent. of a proper assay. You will therefore understand that I have found your representations correct, and recommend the system as worthy of investigation by Quartz Miners.

I remain, very respectfully yours,
SAMUEL A. CHAPIN.

GOLD HILL, May 6th, 1869.

This is to certify, that having worked the Paul & Wood Electric Process, by a barrel containing one thousand pounds at a charge, I find the same works with a perfectness in the dissemination of mercury more thorough than any wet system possibly can do.

The barrel working on a large scale, is perfectly practicable, efficient and cheap in operation. The mercury, though so minutely subdivided, is kept in a clean, pure condition, and readily united so that with properly arranged settlers, the loss may be reduced to a very small percentage.

QUARTZ OPERATOR'S HAND-BOOK.
—BY—
WHEELER & RANDALL.
San Francisco, 1865.

A cheap and handy book for Quartz Prospectors, Millmen, and Amateur Assayers.

This little work, of 130 pages, although partly devoted to a discussion of limited interest to general readers, contains instructions in the WORKING AND ASSAYING OF ORES, AND TABLES FOR REFERENCE, which renders it quite desirable and of frequent service.
Price, $1, coin—$1 30 in currency or postage stamps. For sale by **DEWEY & CO.,**
Mining and Scientific Press, San Francisco.

Sheffield Scientific School
Of Yale College, New Haven, Conn.
This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.
The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.
Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.
Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.
Tuition, $125 per year of forty weeks.
The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.
For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

Important to Assayers.
Crucibles.
The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.
THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:
United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. Branch Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. Branch Mint.
Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.
Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market; we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass. GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.
Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S. Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gaulier, and Thomson, Mass. Yours I find to be not above or more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.
On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PEFERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hanstrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

Railroad Items.

The railroad fever, in this State, is still on the increase. Indeed the entire western slope seems to have entered upon a period of remarkable activity in railroad matter, a result naturally growing out of the rapid filling up of the interior portions of the country with an active, permanent population. Much of this activity is, of course, due to the excitement attending the completion of the great overland road, and the consequent additional influx of population expected in that direction. We notice that numerous local roads are constantly being proposed in various sections of the all Pacific Coast States. Many of these are of conrse mere rival rontes, and cases where only one out of several will be finally adopted and built.

RAILROAD EXTENSIONS.—There is just now an unusual fever in Sonoma and Napa counties. The Petaluma *Journal* says they "have got it bad," up that way, the malady showing itself in favor of numerous "extensions" of the Vallejo and Marysville road, which passes through the southwest corner of Napa county. A road is earnestly called for from "Napa Junction," first to Napa City, thence northerly to Calistoga, thence westerly to Healdsburg, in Sonoma county; also, beginning at the same point, (Napa Junction,) to pass through Sonoma, Santa Rosa and Russian River valleys to a point near Cloverdale; and also from a point at or near Santa Rosa to Bodega and the ocean, *via* or near by Bloomfield. A company has been organized for the purpose of carrying out this programme, with a capital stock of five millions. The aggregate of these roads will comprise a track of 140 miles, and will open up a large number of the most productive valleys in that portion of the State; such an improvement is greatly needed. The citizens of Bloomfield and Bodega are maturing a project for a more direct connection with this city by a branch from the proposed Saucelito and Humboldt road.

The road from Petaluma, running north towards the Russian River Valley, is progressing rapidly—the grading is now nearly completed to Santa Rosa, and the iron for the same is expected to arrive here in season to be laid down, as far as that place, this fall. Its extension to Healdsburg, will, no doubt, be completed another season.

A branch of this road is projected to Bloomfield, at which place a meeting was held a few days since, of which the Russian River *Flag* says: "The meeting is likely to result in the people in that region paying a handsome bonus—say ten or fifteen thousand dollars—to get the branch road completed to that place this year. The Company, through their Superintendent, Col. F. A. Bee, offer to complete the road to Bloomfield by the 1st of January next, if enough money is raised to make it an inducement."

OROVILLE AND VIRGINIA.—The work of grading this road, which had been but just commenced, has been suspended for the present, because of the fact that no aid was furnished by the late Congress. Mr. Bensley, the energetic President of the road, now at the East, is, however, meeting with good success in his efforts to secure funds, from private resources, for an early resumption of the work.

THE railroad bridge, at Marysville, was crosses by a train, for the first time, on the 6th instant.

VIRGINIA AND CARSON.—It is calculated that the Virginia and Carson railroad will be completed to Carson City early in November. When this road is carried to the river so as to connect Virginia City with her principal mill sites and a good timber region, it is confidently expected that the benefits derivable therefrom will be so great as to insure its further extension to the overland road at or near Elko.

THE WESTERN PACIFIC.—Work on this road is being pushed with great energy. Over 200 men are now at work in the vicinity of Barta's, on the west side of the San Joaquin, and between that river and Livermore Pass. A large number of men have recently been transferred from the now completed overland, to the unfinished link which is to effect the counection with this city. A contract has been made within a few days for 4,000 piles, which are to be employed in the improvements which this road is soon to commence on its Oakland water front termiuus.

CENTRAL RAILROAD EXPERDIENT.—The Central Pacific has now about 175 locomo-

tives on the California portion of the road; about 400 box cars; 20 complete baggage and mail cars; 130 head cars; 55 track cars, and 101 section cars. Of passenger cars the supply is as yet quite small, only about 30 having been received. Large numbers, however, have been built and are daily being received over the road. Large additions are also being constantly made to each of the other descriptions of cars. Sleeping cars will be provided, but will be kept only on those sections of the road where night traveling is to be done, and the charge for their use will be extra from the regular fare.

RAILROADS TO AND IN OREGON.—Chief Engineer Hudnutt, who is now engaged in running a line for a road, which it is proposed shall start for Portland, Oregon, from the Pacific Central near the Big Bend of the Humboldt, has recently arrived at Portland, and reports very small engineering difficulties in the way of such a road. Congress, just before its late adjournment, passed a bill giving to this road the same land aid as was given to the Central Overland. It is proposed that this road shall pursue nearly a northeast direction, until it crosses the Cascade range of mountains, 250 or 300 miles South of Portland, when its course will be almost due North to that city, from whence another road will soon be built to Puget Sound. Two branches from this State must eventually intersect this road—the one from Saucelito or Vallejo, passing up the coast, through Humboldt county, west of the coast range, and another from Marysville up the Sacramento Valley. One trunk will serve for the three roads for the first 250 miles south of Portland; while the Marysville branch would strike the main Oregon branch not far from 100 miles still farther this side of Portland, but to the east of the Cascade range, thus requiring only about 250 miles of independent road. The branch from the Central road at Humboldt to Portland will be about 600 miles long. The bar at the mouth of the Columbia, and the falls within twenty miles of the mouth of the Willamette, present such serious impediments to water communication with Oregon that railroad facilities named above, will soon become imperative, and the work of their construction cannot be commenced too soon. These roads will open up to a ready market several of the largest and finest agricultural valleys on the Pacific Coast, which will prove most important business connections with this city. The increase in the value of land along their line will be more than twice their cost. Their final construction is a mere matter of time.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

Agricultural.

Cultivation of Nut Fruits in California.

Very few persons are awars of the large amount of capital invested in the business of importing fruits and nuts into the Atlantic cities; and in no part of the Union is a larger amonnt spent in this direction, in proportion to her population, than in California. The climate at the East admits of little prospect of cultivation in this direction; but not so here. Careful experiments have proven that nearly every variety, of all the long list of nut fruits, will grow to perfection and in great abundance in this State. Even at our present high rates of labor, the most of the foreign varieties of nuts may be grown here, not only for home consumption, but for export to the Atlantic States. We aro already growing some of them and doing well at it; and the press of the State should urge upon our people the benefits which would resnlt from a greatly increased extension of this branch of business. Indeed, there is no reason why Californuia should not become as celebrated for her exotic nut fruits, as for her golden grain.

California has a double interest to subservo in the growing of nut fruits; the secondary object being the supply of hard wood timber for use in ths mechanic arts, which might be abundantly furnished in a few years hy planting a judicious selection of such trees. Our ability to cultivate them has now been fully shown, and it is gratifying to observe the growing inclination to enter more largely upon such culture. The item recently noticed, of the introduction of several thousand Japanese chestnut trees into this State, at one shipment, is a marked evidence of progress in this direction.

There are several varieties of nut fruits indigenous to the State, chief among which is a species of the black walnut, a hard shell nut which grows wild on the bauks of the lower Sacramento and in many other well-watered places in the center and southern portion of the State, particularly about Walnut Creek and other localities around Mount Diablo. This nut is enveloped in a burr, and the appearance and taste of the fruit is much like that of the Eastern fruit of the same name.

Either this or a species quite similar, grows abundantly in many localities in the sonthern part of the State, particularly in Los Angeles County. This tree furnishes a very fine timber for many uses; but will not answer the purpose of the hickory or white oak.

THE HAZEL NUT also grows well in nearly every part of the State, hut of a variety too poor to be worth gathering. The filbert, which is but another variety of this fruit, would no doubt flourish in great perfection if introduced here. This nut requires a cool, dry, gravelly or sandy loam, but uot a particularly rich soil; it seems to prefer au indifferent soil, annually dressed with some suitable compost. An anuual dressing seems to be required for its vigorous growth. It may be propagated by grafting, layers, suckers or seeds. To secure good varieties, grafting or layers should be employed. The filbert should never be allowed to grow high. Dwarfing is the only means of securing a uniformly good crop.

TAE ENGLISH WALNUT crop of the State now rcaches an annual amount of about thirty tons, and is gradually increasing. The quality is quite superior to any imported. It thrives particularly well in localities south of Point Conception. North of that point, except in sheltered places, tho crop is not always sure.

THE ALMOND.—The soft shell almond is also very productive wherever the English walnut thrives. It is a more reliable crop than the latter, and the quality of the fruit produced in California is not surpassed anywhere. The almond appears to flourish particularly well in Santa Barbara County, where it is common to see two-year old seedling trees hearing from one to two pounds of fruit. This branch of culture can he safely entered upon in California, to any reasonahle extent, for export to the East. There is as little risk in this business as any which can he named. In 1864-5 there were only about 4,500 almond trees in the entire State. The number now cannot be much if auy less than 20,000. The culture of this fruit was attempted as far north as Shasta; but the climate there is too cold. It will not suceed, to any great extent, north of the Sacramento River. Its cultivation should not be attempted in open plains, where there is free exposure to high winds. Full grown trees producs from twenty to thirty pounds, worth in this city about $20 per cwt. There are not less than $50,000 worth of this fruit used annually in California, and more than one and a half million in the entire Union. The hard shell almond is much more hardy than the soft shell variety, and grows anywhere in the State; it is a prolific bearer, but the hardness of its shell and inferior quality of its meat renders it of but little value for tablo use.

THE HICKORY has been tried in California, and pronounced a failure. Our impression, however, is that its cultivation has been attempted only in the valleys, and a failure there would be no argument against any attempt to cultivate the tree in the mountains.

We have a most excellent substitute, however, for the hickory, in the pecan nut tree, a native of the lower Mississippi, a hardy and enduring tree, which matures rapidly, and is a prolific bearer of a nut which brings a good price. The wood is second only to hickory for mechanical uses, and is largely employed iu the Westsrn Statss for spokes, shafts, felloes, tool handles, etc. One-third of all the ax and pick haudles brought here, and sold for *hickory*, are made from pecan wood. This tree will grow to perfection in any of our California valleys.

We believe its culture has already been commenced in one or more of the southern counties. Mr. Tuttle, of San Bernardino, if we mistake not, has some trees growing on his ranch, and might possibly be able to give important information with regard to it. Fresh seeds only should bs used; they may be planted iu the field like the acorn. One fact should always be borne in mind in the cultivation of all trees;—if the tree is mainly designed for wood or timbsr, save the tap-root, it will add vigor to the growth. If fruit is the principal object, it is quite as well that the tap-root should be severed, as the effect is to dwarf the tree and improve the fruit. Hence a fruit tree is bettsr for being transplanted, while a timber or forest tree should be planted where it is intended it should grow.

THE CHESTNUT is another tree which can be profitably grown both for its fruit and its timber. It will commence bearing in this climate in about six years. There are many varieties which are much superior to that which is indigenous to the New England and Western Statss. The Spanish or Maronne and the Japanese are among the best, and should be preferred for cultivation here. The latter cau be obtained on application to Mr. Horace D. Dunn, of this city.

In some parts of Europe the chestnut is highly prized for food, and is eaten, boiled or roasted. It is ground into flour and enters into the composition of cakes, puddings and hread, and is stewed with cream into a favorite and dainty dish. In some portions of the south of France it forms the stable diet of the poorer classes.

The chestnut attains a great age, seldom showing sigus of decay until it is over a hundred years old. It proves a most excellent wood for finishing work, furniture, fencing, etc. It grows readily from the nut, and prefers a moderately rich soil—a sandy loam with dry bottom; but will grow well almost anywhere, provided the subsoil is dry or well drained. This tree is now being largely cultivated in Europe for its timber.

The extensive planting of nut-bearing trees in Ca'ifornia, is a mere question of time. Formerly every farmer in this State calculated on a sudden rise in potatoes or wheat or barley, every one or two years, by which he might make a fortune at once. The speculative era is now happily passed, and farming is entered upon as a legitimate bnsiness, to be followed for a long course of years. The people who are now tilling the soil are men who have awakeued to the fact that a permanent home is a desirable thing—better than sudden riches, with the consequent excitement and changes which they bring. Farmers are uow willing to set out frnit and shade trees, and wait for the legitimate returns from such culture; for they have an abundance of the means of support while these trees are coming to maturity. The work of setting out and cultivating such trees can be done when little else is to be attended to on the farm. Farm work is now hurried through by the aid of machinery, leaving the farmer with abundance of time for miscellaueous work, and for mental improvement. Farmers, don't forget to plant a few trees every year; they will be an invaluable addition to your farm and to the State, for their wood, their shade, and their fruit.

THE MINING AND SCIENTIFIC PRESS is one of the most useful publications on the Pacific Coast.

Messrs. Dewey & Co., the publishers, are United States and foreign patent agents, and from their intimate connection with the Patent Office, are enabled to furnish their readers with all the latest patents and improvements pertaining to labor-saving machinery, etc.

Mr. Murray will be among our citizens for some weeks. We bespeak for the excellent paper for which he is agent, a lengthy subscription list in White Pine.—*White Pine News, April 23.*

Company Transactions.

New Incorporations.

New articles of incorporation have been filed, as reported in our exchanges during the past week, in the County Clerk's office in this city, the Secretary of State's office at Sacramento, etc., as follows:

MINING COMPANIES.

RICHMOND MINE. White Pine, (a portion of which was in litigation with Eberhardt), certificate filed at Treasure City, May 1st. Capital stock is $1,200,000, 20 shares to the foot, and of the par value of $50 each. The following gentlemen have been elected Trustees: J. S. Pitzer (President), Abo Bateman, William Towle, F. Walsh and George C. Hall, and R. Rains, Secretary. Place of business, Treasure City.

THE RATTLER S. M. Co. Filed at White Pine Co. seat, May 1st. Capital stock, $500,000, divided into 20,000 shares of $25 each. Trustees (for the first three months), D. Hardy, J. M. Gardner, J. M. Hunter, A. Bateman and George Calder. The claim is between the Aurora Consolidated, Chloride Pogonip Flat.

WHITE CLOUD T. AND S. M. Co. Filed at San Francisco, May 7th. Location of claim, White Pine. Capital stock, $1,200,000; shares $100. Trustees, T. D. Morrell, T. R. Posey, W. H. Howard, A. Sedgely and G. L. Smith.

SAN FERNANDO T. AND M. Co. Filed at San Francisco, May 10th. Capital stock, $1,200,000; 12,000 shares at $100 each. Trustees, A. Sedgely, G. L. Smith, P. Hagemann, C. M. Plum and J. Frontin.

MAMMOTH CAVE M. Co. White Pine. May 11th, at San Francisco. The capital stock is $2,000,000, divided into 20,000 shares at $100 each. Trustees, W. R. Deittrick, J. E. Foye, H. C. Conbron, C. N. Oberley, J. H. Sayers, G. A. Ball and Alexander Buswell.

RICHARDS QUARTZ M. Co. Bald Hill District, Del Norte Co. Cal. May 12th, at San Francisco. Capital stock, $300,000; divided into 3,000 shares. Place of business, San Francisco. Trustees; Edward Merryfield, C. W. Wilson, Martin Kelly, Wm. A. Newell and John Lloyd.

COLUMBUS M. Co. Roach Hill, Placer Co. May 4th at Sacramento. Capital, $250,000, in shares of $50 each. Trustees; James Milburn, Frank Henderson, E. P. Bucklin, D. P. Belknap and Ed. Marks.

DEL NORTE M. Co. To operate at or near Happy Camp, Del Norte Co. May 4th at Sacramento. Capital, $600,000, in shares of $50 each. Trustees; Wm. Pierce, Lewis Pierce and Chas. F. Webster.

MISCELLANEOUS.

UREN FUSE Co. San Francisco May 10th. The object is to manufacture in the States and Territories west of the Rocky Mountains a fuse, under a patent issued in December, 1863, to Richard Uren and others. Capital, $100,000, divided into 200 shares of $500 each. Trustees; Richard Ureu, Thomas Dunstone and Rodmond Gibbons.

HOMESTEADS.

THE GREAT PARK HOMESTEAD ASSOCIATION. San Francisco, May 13th. Capital stock, $125,000, divided into 500 shares, at $250 each. Trustees: Cyrus Palmer, Adoph Unger, David N. Hawley and W. L. Palmer.

THE "SUPERIOR" HOMESTEAD ASSOCIATION. To purchase two full blocks and four fractional blocks in the University Mound Tract. San Francisco, May 13th. Capital stock, $65,500, divided into 133 shares of $500 each. Trustees; W. T. Welcker, Thomas B. Lewis, E. W. Cary and B. F. Brady.

THE "FAIRMOUNT." San Francisco, May 13th. Capital stock, $19,880, divided into 60 shares of $330 each. Trustees; H. E. Green, Hyram Wilder, A. B. Winegar, C. F. Webster, John H. Wohlers, Thaddeus Winsell and S. P. Kimball.

THE "BERKELEY." Parcel of land in Oakland. San Francisco, May 13th. Capital stock, $34,160, divided into 112 shares. Trustees; Thomas Anderson, George W. Fisher, E. J. Passmore, H. B. Forester, W. B. Rand, James Atkinson and George Bates.

Homestead share sales continue active.

Meetings, Elections, Etc.

SACRAMENTO BEET SUGAR Co. Trustees elected: W. E. Brown, W. Wadsworth, Julius Wetzler, T. M. Lindley and Theodore J. Milliken.

MAGENTA MINING Co. Trustees elected San Francisco, May 11th.: W. K. Deitrick, Peter Taylor, H. Casanra, D. W. Perley and A. Buswell.

WELLS MINING Co. Trustees elected San Francisco, May 11th.: Geo. B. Merrill, (President,) S. P. Wells, (Vice-President,) O. V. Sawyer, (Treasurer,) J. H. H. Williams, J. A. Pritchard. George H. Russell was appointed Secretary.

LEXINGTON MILL AND MINING Co. Trustees elected San Francisco, May 11th.: W. B. Latham, Jr., J. W. Tabor, Fred Lux and P. Zadig.

THE CELTIC AND TEUTONIC FARM ASSOCIATION. Trustees elected San Francisco, May 6th: Henry Brickwedel, John A. McGlynn, John P. Schmitz, Hon. M. Meagher, Henry Hinders, John T. Barry, F. S. Wensinger, Drury Malone, Jacob Schreiber, P. A Roach, Geo. Groezinger, M. Flood, F. Pulzmann, Daniel McCarthy, John Wieland, Michael Hays, Hermann Schwartze, Jasper O'Farrell, Frantz X. Kast, and Robert Sherwood. Officers elected: President, Henry Brickwedel; Vice-Presidents, John A. McGlynn and Jasper O'Farrell; Treasurers, Hermann Schwarze and Robert Sherwood; Secretaries, F. X. Kast and Thomas Mooney.

UNIVERSITY R. R. Co.—At a meeting held at T. B. Lewis' office, May 11th, the President, J. H. Jennings in the chair, measures were discussed to secure further subscriptions to the stock and speedy completion of the road to Bay View. Colonel Walker was elected permanent Secretary, and 309 of the 1,200 shares were subscribed for. The engineers report was read and approved.

New Patents Issued to Pacific Coast Inventors.

FOR THE WEEK ENDING APRIL 27TH.

SUBSOIL PLOW.—James B. Pullman, Los Angeles, Cal.—89,432.

I claim the combination, in a subsoil plow, of the share E, coulter D, and heel-plate G, with the stock A B C, substantially as and for the purpose herein shown and described.

ANCHOR.—Frederick Wittram, San Francisco, Cal.—89,454.

I claim the combination, with the anchor-shank A, of two or more pairs of arms or flukes, pivoted or otherwise secured to the shank, in such a manner that they can be swung in pairs to a limited extent on each side of said shank, in planes perpendicular to or at any other convenient angle to each other, for the purpose specified.

MACHINE FOR CONCENTRATING AND SEPARATING ORES AND MINERALS.—Robert George, Denver City, Colorado Territory. 89,476.

I claim, 1. A machine for concentrating and separating metals and mineral substances from rocks, alluvials, and other substances, contained in combination, in their natural state, or as mats, or other metallurgic products, when constructed and arranged in the manner and for the purpose herein described.

2. The construction and arrangement of the sieves B1 and B2, in a machine for concentrating and separating ores and metals, in the manner and for the purpose herein described.

3. The combination of the blast-chamber E with the valves *k1 k2 n1 n2*, guide-rods *j1* and *j2*, and coil-spring *i1* and *i2*, in the manner and for the purpose herein described.

4. The combination of the blast-chamber E with the truck *d*, on the shaft *e*, and the piston D, in the manner and for the purpose herein described.

5. The pitman F1 and F2, with the adjustable screw *o*, crank G, wheels *p1* and *p2*, and the conveyer H1 and H2, in the manner and for the purpose herein described.

6. The combination of the wheels *c1 c2*, cords *f1 f2*, and the set-screws *g1* and *g2*, in the manner and for the purpose herein described.

TOY TAROET.—B. L. Stone, San Francisco, Cal.—89,516.

I claim the combination of target, letter A, with the dart, letter E, by the means of the elastic india-rubber cord, letter C, and the piece of twine, letter D, in the manner herein described, and for the uses and purposes hereinbefore mentioned.

THE RAILROAD CELEBRATION—The completion of the Pacific Railroad seems to have been the occasion for a general jubilee throughout the United States. All the prinoipal cities in the Union have taken a part in congratulating exchanges of sentiment. Chicago, however, was more enthusiastic in the matter than any other of our Eastern cities; and as she is properly the eastern terminus of this great highway, it was right that she should thus jubilate by the ringing of bells, firing of cannons, etc., on the joyful occasion. Owing to an unexpected delay on the part of the Union Pacific officials, the last rail was not actually laid on Saturday—the day on which San Francisco and Sacramento celebrated. It was laid on the Monday following, and the last blow on the last spike sent the electric current, east and west, to speak with common voice, and announce the precise instant on which the finishing work was done.

OIL IN PENNSYLVANIA.—During January last, the average daily production of petroleum in Pennsylvania was 10,192 barrels.

Mining Notices.

Senator Silver Mining Company.—Location of Mine: Virginia City, Storey County, State of Nevada.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-sixth day of March, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.

And in accordance with law, and an order of the Board of Trustees, made on the twenty-sixth day of March, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the sales-room of Maurice Dore & Co., auctioneers, No. 327 Montgomery street, San Francisco, California, on the twenty-eighth day of May, 1869, at the hour of 11 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. B. WINCARD, Secretary.

Office, 408 California street, San Francisco. may7

Siempre Viva Silver Mining Company, District of Zarigossa, Sinaloa, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of April, 1869, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 318 California street.

Any stock upon which said assessment shall remain unpaid on the twenty-first day of May, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the seventh day of June, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.

Office, 318 California street, San Francisco. ap17

Troy Ledge Mining Company, White Pine District, Lander County, Nevada.

Machinery.

VARNEY'S

PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Millmen are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1yl San Francisco.

ELLERY'S PATENT

India Rubber Cement and Paint

—FOR—

TIN, IRON AND METALLIC ROOFS,

Iron, Brick and Wooden Buildings,

SHIPS, STEAMBOATS, STAGES, CARS,

AND FOR ALL EXPOSED SURFACES.

Is water-proof and indestructible; will neither rot, peel, nor crack; will withstand any climate; can be put on in any color, and is less expensive than other Paint.

New Cloth Roofs put on. Old Roofs cemented and painted. Leaky Roofs made tight.

☞ No Coal Tar or Asphaltum used. All work guaranteed. Orders punctually attended to.

A NEW SLUICE

For Concentrating Gold, Amalgam, Sulphurets or Black Sand, in Quartz Mills,

OR PLACER MINES.

It is made without iron work, is cheap, durable, and effective; can be made by any good mining carpenter at the mine or mill, of sizes to separate the Sulphurets from one to fifty tons of sand per hour. There is no expense for motive power, or to handle the sand, if it can be run from the mine or mill directly into the receiving sizing boxes by means of water. It is continual, self-discharging, and can be used for concentrating fine gold and black sand, on the river bank or ocean beach. They may be seen at work in the American Company's Mine at North San Juan.

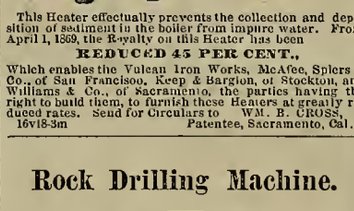
For information how to construct, and the cost, address

ORLANDO JENNINGS,

17v18 North San Juan, Cal.

CROSS' COMBINED

Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., of San Francisco, Keep & Bargion, of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to WM. B. CROSS,

16v18-3m Patentee, Sacramento, Cal.

Rock Drilling Machine.

Patent for Sale.

The Patent of George C. Phillips, issued Dec. 1, 1868, for a Steam or Compressed Air Rock Drilling Machine is now offered for sale on most reasonable terms. An illustration and full description of this Machine can be seen in the Mining and Scientific Press of March 27, 1869. Weight of Machine for ordinary tunnel work, 75 lbs. It is adjustable so as to drill in any direction; will make from 300 to 500 strokes per minute. One machine will do the work of twenty men.

The inventor guarantees to satisfy any party who will interest themselves in the matter, of the entire practicability of his invention. Address, by express letter,

GEORGE C. PHILLIPS,

19v18-1m Shermantown, Nevada.

LEA & PERRINS'

CELEBRATED

WORCESTERSHIRE SAUCE

Declared by connoisseurs to be the only

GOOD SAUCE.

Caution against Fraud.

The success of this most delicious and unrivalled condiment having caused certain dealers to apply the name of "Worcestershire Sauce to their own inferior compounds, the public is hereby informed that the only way to secure the genuine, is to ask for

Lea & Perrins' Sauce,

and see that their names are upon the wrapper, labels, stopper, and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against Manufacturers and Vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce, and see name on the Wrapper, Label, Bottle, and Stopper.

Wholesale and for Export by the Proprietors, Worcester; Crosse & Blackwell, London, etc., etc.; and by Grocers and Oilmen universally. Agents, CROSS & CO. San Francisco. 3v18 6m

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.

Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

J. M. BUFFINGTON,

Room 37 New Merchants' Exchange, California street San Francisco 17v15-tf

Engineering.

Steam Carriages on Common Roads.

At a meeting of the New York Society of Practical Engineering, held April 13th, "Steam and Steam Traction" was the regular subject selected for discussion, the introductory paper being read by Mr. J. K. Fisher. Mr. F. first gave a summary of the various indorsements of steam carriages that have been made by different engineers of standing, beginning with James Watt, who made application for a patent in 1784. Richard Trevithick was the next to build a steam carriage; he was followed by Ogle, Summers and others, applied their time and talent in improving this mode of traction.

In remarking upon the performances of English steam carriages, Mr. Fisher alluded to the fact that the high price of tolls for such conveyances, on English roads, was at first a serious drawback to their introduction, and that when, after many years, the tolls were materially reduced all the original patents had expired, rendering it unsafe for the investments of large capital.

A great inconvenience attendant on the use of steam carriages was owing to the existence of two difficulties,—First, that engines could not last long without easy springs; and second, that such springs were impracticable because the present construction of the engines, rendered unavoidable the lifting action of the connecting rods, causing the rapid destruction of such springs. This latter objection was nearly or quite obviated at the expense of the former, by strengthening or stiffening the springs until thin elasticity was almost totally destroyed. Gurney, and others, invented many devices for overcoming this difficulty; among which was mentioned Hancock's chain gearing. This contrivance proved inefficient from the frequent breaking of the chain.

After noticing other contrivanees, tending to the same end, Mr. Fisher proceeded to discribe an invention of his own, which he claims obviates all the difficulties in this direction. He also described the link valve-gear. This device, which the writer himself applied to steam carriages, dispenses with the use of brakes, governing the power with delicacy and exactness. A noticable difference between the English plan of steam carriages and that followed by Mr. Fisher is, that in the former, the axles are placed near each other, and in the latter far apart; an advantage claimed by Mr. Fisher in his, over the English plan, is a low center of gravity, and perfect freedom from lateral slipping. The fore wheels are also placed in front of the carriage. The application of a screw for steering purposes was also proposed hy the writer instead of the English steering apparatus which, under some circumstanees, is unmanageahle, sometimes even dislodging the helmsman from his position.

In conclusion the writer referred to the various incidental advantages which would naturally arise if steam carriages came into general use, such as the lessening of the expense of road repairs, the practicability of other and cheaper modes of paving, the comparative freedom from street litter, dirt, etc., etc.

An interesting discussion upon the merits of steam earriages followed the reading of the paper, which was participated in by many of the members of the society and of the assembly.

TAXING IDLE MINES.—The Nevada *Gazette* says there are a large numher of gravel mines in that vicinity which, although they have not been worked for six or eight years, are still held by original owners, and are not included in the mining assessment roll. The *Gazette* thinks that inasmuch as other mines are taxed, there is no reason why these should he exempt. Tax them, and if their owners will not work them, they will probahly sell out to somo one who will, and the public will therehy be benefited. That rule is heing applied to the large ranches in the State, and we see no good reason why it is not a good one to apply to mines as well.

SPAIN spends less money upon education, throughout the kingdom, than does the single city of New York.

Mining Summary.

[Continued from Page 211.]

NEW MEXICO.

Moreno Mines.—Correspondent of the Denver *News*, April 21st: L. B. Maxwell's quartz mill yesterday cleaned up 230 ozs. of gold, which was 43 hours' run from the discovery shaft on the Aztec lode, at a depth of 75 feet, which shaft has a five feet ereview. The quartz was not selected, but all crushed as taken out.

Gran Quivira.—The Albuquerque *Review* announces the rediscovery of the ancient mines of Gran Quivira, which were worked by the Spaniards over 300 years ago. When the Apaches compelled their abandonment, the workings were closed up with masonry, and the walls covered with earth. They have often been searched for since but without success.

New Mexico Mining Co.—Santa Fe *Gazette*, April 24th: Col. A. L. Anderson is making preparations to begin work at the Co's mines on a more extensive scale. Work on the new mill house has already progressed considerably. With the improvements that are to be made, Col. Anderson intends to crush at least 60 tons of ore per day. The number of stamps will be forty.

OREGON.

Quartz in Southern Oregon.—The Jacksonville *News*, says: Owing to the failure of our placer mines this season, from want of water, miners are beginning to turn their attention to quartz.

The timber gulch lead is furnishing the most flattering prospects, simply because its owners are applying the true test—that of going down on the lead.

Gold Hill—unprecedently rich as it was—was never sunk on to a depth exceeding 50 feet. The proprietors now offer one half the lead to any person that will put a shaft down 200 feet.

The Fowler lead, at Steamboat City, has paid big dividends, and would so again if properly worked. The Davenport, Hicks and Blackwell, ditto.

Jacksonville *Sentinel*, May 1st: Dillon & Bowden are now down on their lead about 75 feet and still find rich prospects. They will make the rock taken from the shaft pay all expenses.

WYOMING.

Atlantic City.—Sweetwater *Mines*, April 21st: Some eight or ten men are at work on the building for Anthony & Irwin quartz mill, across the creek. Rice & Co's mill is at the Point of Rocks, and will be shipped across to Atlantic immediately. The ledges around Atlantic are being rapidly developed. We were shown specimens from the "Sowles and Perkins" lead, that were covered with free gold. This ledge presents a vein of quartz two feet in width, and prospects $1,100 to the ton. Lamoreaux brothers are vigorously prosecuting work on the "Golden Leaf." Pease & Co. have started a new shaft on the "Mary Ellen," and are opening out a splendid vein of quartz. They intend starting their arastra as soon as the weather will permit.

Golden Gate Ledge.—There is a shaft down 35 feet, with a 12-foot vein; the rock yields $50.75 per ton, by amalgamation process.

Nabob.—This ledge, discovered within ten days, has several tons of ore on the dump, which resembles that of the Nellie Morgan. Work of development is going on.

Young America.—28th: L. A. Hall, of Chicago, arrived in town a few days since, to see after the interest of the Co. He has ordered on, by telegraph, the mill built in Chicago. Operations will be immediately resumed.

Two ledges have been struck during the past week. One by Smith and Chapin called the "Sheridan," and the other by McCarty and McAdams called the "Irishman."

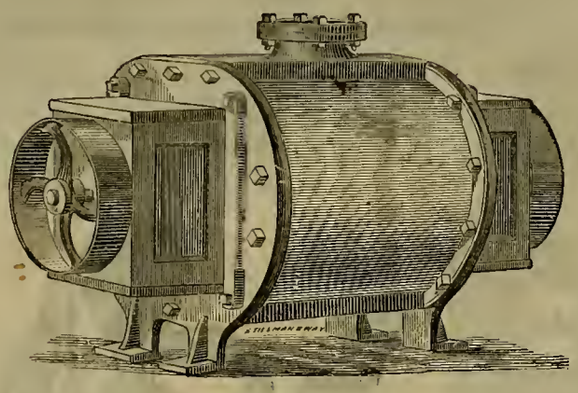
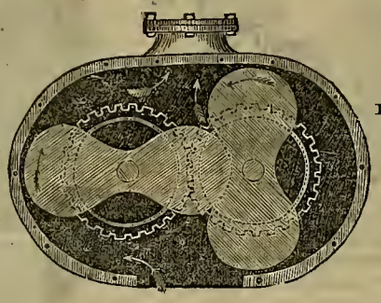
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.



ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Etna Iron Works, San Francisco, and many other places.

Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address

KEEP & BARGION,

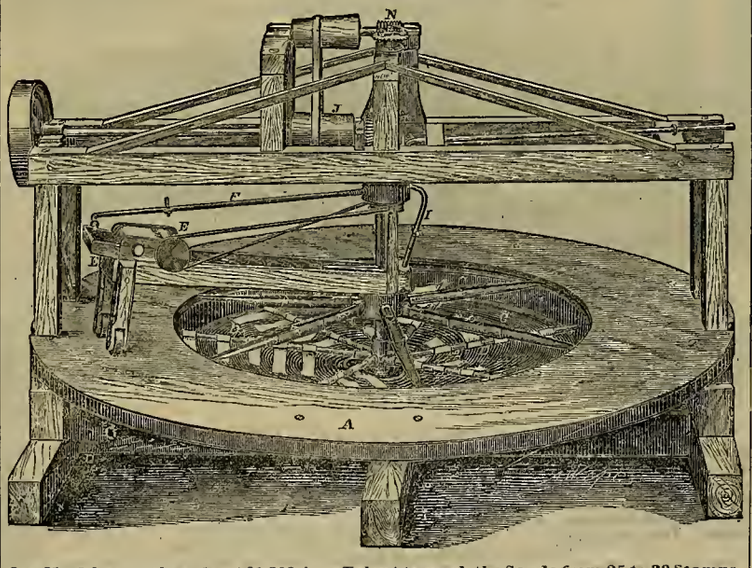
PAINE & STEPHENS' IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.



One Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps,

Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Banner Co's mill near Nevada, and see for themselves.

CERTIFICATES:

Grass Valley, Jan. 4th, 1869.—This is to certify, that we have used the Paine, Stephens & Harry Concentrators for over twelve months. They have given us entire satisfaction, and are the best we ever used. WILLIAM WATT, Supt. Eureka Mine.

This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphuret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets.
WM. L. TISDALE, Supt. Star Spangled Banner Mine.

Nevada City, Oct. 26, 1868.

Any one wishing to purchase one of these useful machines, can do so by applying to THOS. N. PAINE, at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.

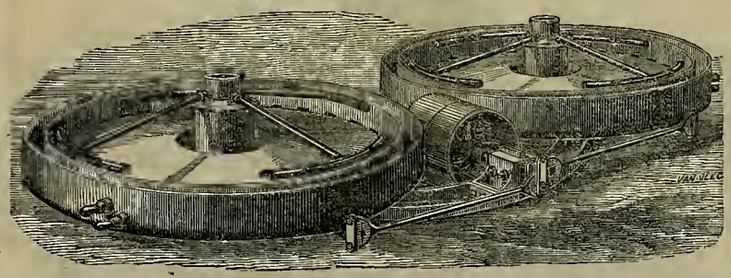
HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.



There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

RECOMMENDATIONS:

SAN FRANCISCO, October 19th, 1868.

MR. M. HUNGERFORD—*Dear Sir:*—We have had twelve of your Concentrators at work at the Oneida Mine, Amador County, for about six months. They give entire satisfaction. They are strong and substantial, requiring, thus far, no repairs, and do their work thoroughly and effectively. At a recent clean-up of four of them, I found that in four weeks' time we saved about $500 in free gold, besides the sulphurets, or not far from one dollar per ton on the entire crushing of the ten stamps connected with them. In my opinion, it is for the interest of every quartz mill to have your machines. Yours, respectfully, GEORGE PRINGLE, Supt. Oneida Mine.

OFFICE OF THE ONEIDA MINING COMPANY, Jackson, May 13th 1868

MR. MORGAN HUNGERFORD—*Dear Sir:*—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any others I have used. I have ordered Messrs. Goss & Lambard to make eight more for me as soon as possible. Very truly yours, JAMES MORGAN.

BIG OAK FLAT, May 25th, 1868.—*Mr. T. W. Mulford*—DearSir:—I have used two of M. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

The Hungerford Concentrator has only to be seen to be appreciated. No millman will use any other kind after he has tried that. They are in active operation in mills throughout the State, and give perfect satisfaction.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

In future these Pans will be manufactured by GODDARD & Co., at the Pacific Iron Works, San Francisco, which is a guarantee that they will be built in the most substantial manner.

These Pans may be seen at the Pacific Iron Works, First street, near Howard, San Francisco.

Address,

GODDARD & CO., San Francisco.

Or M. HUNGERFORD, at the Pacific Iron Works.

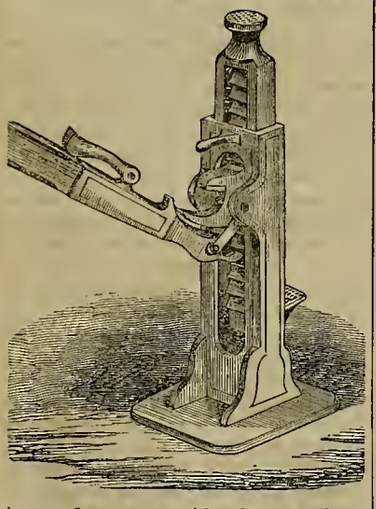
Stebins' Improved Lifting Jack.

The object of the invention herewith illnstrated, is to provide a lifting jack which shall be so constructed that heavy weights may be either raised or *lowered*, as desired, and by the same movement of the lever. This is accomplished by meaue of a pawl, pivoted directly over the operating lever, having a curved projection at the end oppoeite that which operates in the rack. The position and ehape of this pawl is distinctly shown in the accompanyiag engraving. The lever, as now shown, is arraaged for *lifting*—the pawl being so hung, with reference to its center of gravity, that with each downward movement of the lever it

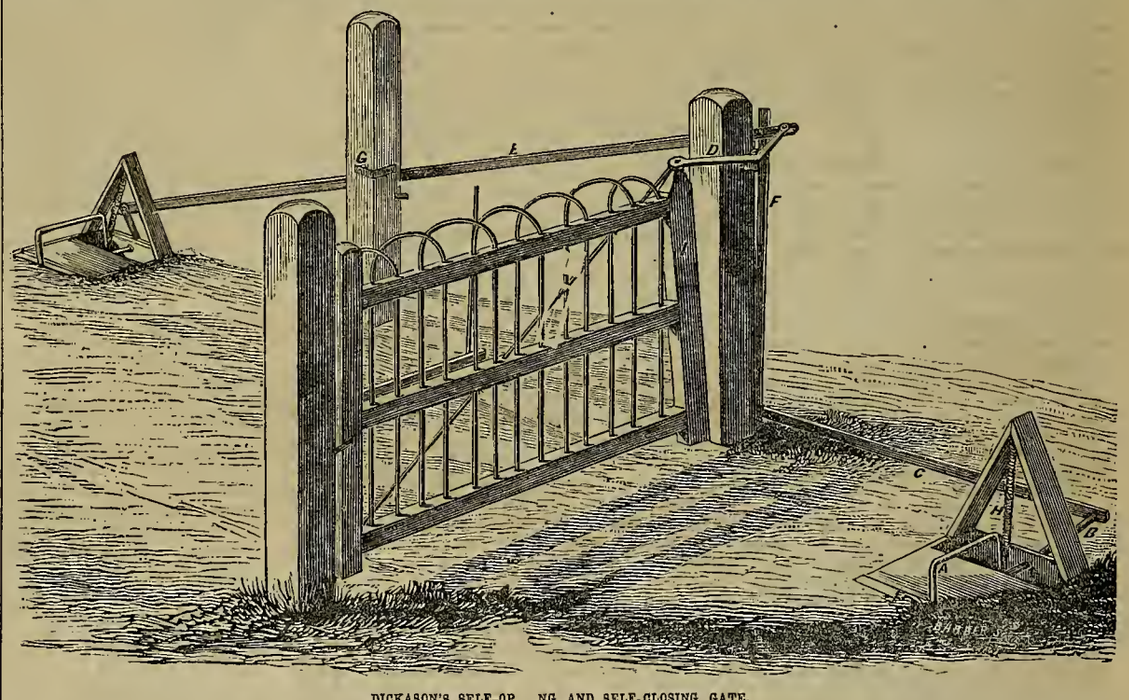


is caused to engage with a lower tooth on the lifting bar. When it is desired to lower any weight, tho weighted arm, which is seen hinged to and thrown back on the lever, is thrown forward so as to rest its weight on the forward curved projection of the pawl. When thus arranged, the jack ie ready for *lowering*, which act is accomplished by precisely the same movement of the lever as before—the center of gravity of the pawl being now, by the added weight of the hinged arm, changed so as to disengage the pawl from the lifting-bar when the lever is preseed downward; so that by sncccssive vibrations any weight is lowered by tho same motion with which it is lifted. Tho invention is very simple, and can ecarcely fail to provo a great coavenience, aad effect an importaat eaving of time to pereons engaged in lifting heavy bodies, where hydraulic power is not required.

This invention has been patented through tho MINING AND SCIENTIFIC PRESS AGENOY. Mr. Timothy Stebins, the inventor, is now manufacturing his jacks for sale, and can be found over the City Foundry on Fremont street, in this city.

Self-Opening and Self-Closing Gate.

One is inclined to placo little confidence in the alleged success of any invention of this kiud, on account of what seems to be a necessarily complicated piece of workmanship, and the well known tendencies to perversity and ricketiness in gates in general. That a self-openiag gate is a desideratum, every man and woman, and every child especially, knows full well. Our illustration represents the Dickason invention, the points concerning which will strike even an unbeliever in such things quite favorably, since its working parts appear to be ncarly as simple as the gate itself. Let us see how the inventor has dealt with his problem:



DICKASON'S SELF-OP NG AND SELF-CLOSING GATE.

The chief featuro showiag originality, and of practical value in the invention, is found in the upper "crooked hinge," D, and in the elanting of that end or part of the gate-frame marked I. To appreciate the full effect and advantage of this, in practice, the device should be seen at work in a model, or in a working gate.

A wheel strikiag the bent bar, A, B, (which has all the leverage that the diameter of the carriage wheel will allow) has the eimple effect to lift the latch-ead of the gate up out of its fastening, but at the eame time, by the motion of the hinge arm D towards the eide ou which the gate is to swing, to throw the frame post I into enoh a position that attraction of gravitation is brought to bear, not to be exhausted until the latch-end of the gate has swung to its lowest level, which will bring the gate against the post G. Its force will epring the latch that holds it there.

When the carriage has passed through, the wheel will strike the bent lever-rod on the opposite side; the effect of which is to lift the latch-end of the opened gate up again, out of its fastening, and hy the return motion of the upright of the frame, I, to swing it back into its closed position, where it is likewise caught and held fast by its latch-spring.

Should the carriage approach from the opposite directioa, the operation would be in every respect the same, as can be eeen from tho identical effect that the wheel would have upon tho hinge-arm, D. In practice, the horse has merely to be checked to a walk, the gato opening so quickly wo are informed, even against a hreeze, as not to halt the animal.

The wheel lever arrangement is anchored in the ground by mcans of stones. To keep the levers in place upright, the spiral spriag, H, is applied, in the manner represented. Should the working becomo loose, the rods, C and F, can be adjusted by putting one of tho bolts into a new hole. The length of the rods and the arrangements are euch as to leave ground to be occupied during the operation by the horse and carriage. A cheap, neat gate of this kiad is made of three light bars of wood and quarter-inch wire, as represented in the engraving. The extra cost over an ordinary gate need not exceed $5. It wae was patented by John Dickason, an Eastern inventor, June 4th, 1867. Further particulars, models, county rights, etc., may be obtained of E. P. Hicks, the owner of the patent, or through C. W. M. Smith, Attorney. No. 526 Montgomery etreet; or C. H. Filbrick, model-maker, corner of Mission and Beale etreets, San Francisco, or Frisbie Hicks, Silverton, Marion Co., Oregoo. We may add that the gate is already in operation in many placee in San Francisco and San Mateo counties, and other localities around the bay. Mr. Hicke informs us that it is giving satisfaction everywhere.

THE author of "Todd's Student's Manual," revered of all collegians, is in San Francisco. That Dr. Todd should be a living persou instead of walking the Elysian groves in blessed companionship with Dante's deceased philosophers, is surely a pleasing circumstance to all who know him by his works, or who have ever made any use of his *Index Rerum*. That he should be so near to us as San Francisco, adds to surprise a degree of wouder that euch things can be, and the gold-dealing world's not making more of it. But we find ourselves carried instantaneously out of our associations with classic romance, and ancient philosophic grandeur, into reality—brought to the van of to-day, to the very point of civilization's moviag column, by the fact that Dr. Todd is also the author of a recent very sharp criticism on the woman's rights movement—which was itself quite sharply handled by Miss. Dodge (Gail Hamilton).

Columbia College School of Mines.

The catalogue of this very useful institution, for 1869, has been received. This is a first class school, equal in many respects, and superior in a few of its departments, to some of the most noted European mining academies. That it should fall short in other respects, independently of its situation at a distance from mining practice, is certainly not otherwise than could be expected—owing partly to the mercurialism of American character, which prevents many of our best men from settling down contentedly to such quiet duties as those of instruction, at a moderate compensation, while the mountains of the west are holding forth to them their golden prizes; and partly to the newness of the undertaking. In metallurgy and assaying the facilities offered are excellent, so far as the instruction is concerned—superior to Freiberg, indeed—results due to Mr. Egleston's energetic working. Another department which impresses the visitor most favorably is that of Geology and Paleontology, in the hands of John S. Newberry. Professor Newberry has arranged systematically, for the uses of his students, what must be, by this time, the best working cabinet in the United States, especially so for students interested in or from the western half of the continent. The enthusiasm and enterprise displayed by that gentleman in collecting, and determining, in connection with Pacific Railroad and other surveys, the fossils of our western rock formations, render his connection with the Columbia College School of Mines very advantageous to those who would devote themselves to our almost unworked, yet very promising field. In fossil plants especially, Professor Newberry has made himself the first authority, and his collection is unparalleled.

In mineralogy, the practical and working department thereof—the most important to students—is assigned to J. H. Caswell, who is also an enthusiast, and possessed of very thorough acquirements, in that specialty.

The catalogue for 1868-9 shows, in addition to the solitary graduate of 1867, a list of twenty graduates of 1868, half of whom are already engaged in the practice of their profession, while of the remaining half, two are in Europe, and four are employed as instructors. The students of the third year now number 17; those of the second year, 18; those of the first year, 17; preparatory students, 9; special students, 27; resident graduates, 5—total, 93.

The following, from the New York *Journal of Mining*, is pertinent:

One praiseworthy feature in the plan of tnition is the requirement that the students shall execute "projects" in the different departments of metallurgy and machinery. The proper method of preparing plans and estimates is not too commonly known among engineers—witness the partial and untrustworthy report of this kind embodied in many a mining prospectus. We hope the day will come when the assay of a piece of rock, and the loose statement of somebody that "there is plenty of it," that "it can be mined for almost nothing and reduced for less, leaving immense returns for the capital invested," will no longer be considered a basis upon which hundreds of thousands of dollars may be thrown away in blind speculation. One reason of this evil hitherto has been the inability of many engineers to make detailed estimates for mining operations; another and still stronger reason has been the ignorance of their value on the part of capitalists, and their consequent unwillingness to pay for thorough preliminary work of this kind. We have often said, and we continue to believe, that the increase in the number of competent engineers will work the necessary reform.

FIVE LITTLE ERRORS IN FOUR LINES, are perpetrated in the *Scientific American* of January 23d, in regard to "A New Silver Ore" from Mono Co., Cal.—the "parisite," discovered by "Dr. Paris," and aualized by "Prof. Arent," etc. This is the partzite, named after Prof. Partz of Oakland: $(Cu\ O, Ag\ O, Pb\ O\ Fe\ O)^3$, $Sb\ O^3$ x3 HO, according to the discoverer's analysis.

[From Rowlandson's "Earthquake Dangers, Causes, and Palliatives"—just published.]

Hardening of Mortar, Climatic Conditions, Etc.

[Continued from Page 306.]

THE ADHESIVE AND COHESIVE QUALITIES OF MORTARS, AND THE FLEXIBILITY OF MASONRY AND BRICK-WORK.—The *adhesion* of mortars and cements to stone or brick in a direction perpendicular to the faces of the joints of the work, is always much less, with ordinary materials, than the *cohesion* of the latter for equal sections; it therefore almost invariably happens that the lines of fracture in walls after earthquakes, whether in stone-work or brick-work, composed of good bricks, follows down or along a line of joints, producing a jagged or serrated fissure, the jaws or serrations depending upon the length of the bed of each block or brick, and the depth of the courses.

It has been found that the adhesion of Portland cement to Portland stone is 146 pounds per square inch, while the cohesion of the cement itself is 400 pounds ditto; and that of Parker cement to granite, 22 pounds, the cohesion of the cement being 300 pounds ditto.

The adhesion of common lime mortar varies enormously with the nature of its materials, the sort of stone or brick with which it is used as a cement, the thickness of the joints, the care taken to fill them effectually and solidly, the degree of wetness or dryness of the mortar itself, and of the stone or brick to which it is applied, the rate at which the mortar has been dried during its setting, and the amount of moisture and air to which it may have been subsequently exposed. All these conditions, or some of them, have been found sufficient to make a difference of absolute cohesion of more than 2.1, between old Roman mortar, consolidated and hardened for ages, and good modern mortar, allowed sufficient time to be viewed as fully set or indurated. In many cases, very dry mortar has been found much more brittle and easily fractured than when wet, even after complete induration has occurred.

The actual extent of elastic flexibility of stone and brick masonry, especially the former, is not commonly considerable; and unfortunately as yet no *precise* measures of these exist for any class of masonry. Were it not for this property, however, no building would stand even a moderate shock; and were the velocity of the wave confined within the limits of the velocity of the center of oscillation of the structure, considered as an elastic compound pendulum; whose time of vibration is due to the length of a simple pendulum equal to the hight of that center above the base, and were the amplitude of the shock within the limit of elastic displacement of the masonry, etc., at that center, no building would be thrown down.

A well constructed brick and mortar wall of thirty or forty years' induration and 40 feet in hight, unsupported, two bricks or 1.60 feet* in thickness, has been observed by Mr. Mallet, to vibrate nearly two feet transversely at the top, during a storm of wind, before it fell; and that not until after many oscillations had disintegrated some of the horizontal joints, and produced several vertical fractures.

The point of greatest flexion traversed along the length of the wall, as each oblique gust of wind impinged upon it, like the waves of a rope suspended at one end, and jerked transversely at the other.

An octagonal brick chimney stack, with a heavy granite capping 160 feet in hight above the ground, was instrumentally observed by Mr. Mallet to vibrate in a moderate gale of wind, when a few months built, nearly five inches at the top.

The above are illustrative of the extent of flexibility in good brick-work, which possesses that property in a far higher degree than other masonry; the bond of the mortar being better, the flexibility being greater, both in brick and thick mortar joints,—the latter being very numerous and the elasticity more nearly alike in both, than in stone masonry. When the joints are much fewer in proportion, the stone, relatively to the mortar, highly elastic and rigid, and the bond, so far as adhesion of the mortar is concerned, small, (in the case of many hard silicious stones, such as granite, almost *nil*) the result of this difference is, that well-built and indurated brick walls, when fractured, breaks indifferently, nearly through joints and bricks; but in stone walls the line of fracture is confined to the mortar joints, with rare exceptions the rigidity of the several blocks transferring the whole of the compressions and extensions due to the strains, to the mortar above. From this cause it was observed very uniformly throughout the earthquake region, that when a brick construction was superimposed upon stone-work, as is seen in Italian churches, the brick-work, although of so much less density, fell as one mass, with fractures of severance along the lines of junction of the two; and *vice versa* when the brick-work, as in a few cases, was beneath, and stone-work above; and when the latter was thrown, it did not push the brick-work over in its fall,—the latter remained comparatively unharmed.

*The English brick is 9x4½x3 inches.

The following tables will be found of great practical interest to the architect and builder:

RESISTANCE OF MATERIAL TO PRESSURE AND TENSION.

Plaster of Paris (mean)	94	753	84	"	Laisne.
		500	55		

The few experiments made on the subject tend to show that the resistance of stones, etc., to tension, varies from one-eighth to one-tenth the resistance of the same material to compression. The third column, so far as bricks are concerned, was calculated at the mean of these data.

ADHERENT RESISTANCE OF MATERIAL.

MATERIAL.	Weight per cubic foot—sp. gr.	Resistance per sq. in.	Adhes't Resistance per sq. in.	AUTHORITY.
Granite to Portland Cement	164	.....	97	Treadgold.
Granite to Parker's Cement	164	.....	22	White Trans.
Kentish Rag and Parker's do	.....	.....	29	do.
Oolite and Parker's Cement	.....	.....	42	do.
Oolite to Portland Cement	.....	.....	146	do.
Mortar (sand, 3; lime, 1)	100 to 119	11 to 20	9.88	Bolsted and Gauthey, Treussard & Totten.
Mortar, green and fresh	.....	.....	.....	Bolsted, Gauthey, Treussard and Totten, Rondelet, do.
Mortar, ground lime and tiles	.....	2	.....	
Brick and Tile to Mortar	100 to 120	40 to 80	5.26	
Jurassic Limestone to Mortar	.....	.....	3.80	
Hydraulic Mortar	.....	.....	8.27	

In the above table, the cements had, in all cases, six months to indurate, and the mortars (except in the second case) from six to seventeen months' induration.

The limit of flexibility of stone masonry exposed to earthquake shocks depends, to an immense extent, upon the flatness and superficial area of the beds of the individual stones, and the completeness with which "breaking joint" and thorough bonding are preserved in the setting.

Where the masonry consisted of rounded, lumpy, quadrated ovoids, of soft limestone, as already mentioned in the general description of the poorer and older towns (such as Polla), the whole dislocation occurred through the enormously thick, ill-filled mortar joints; and almost all buildings thus formed fell together at the first movement in undistinguishable ruin. At Pertosa, a poor but more modern town, the class of masonry was a little better, and, it may be remarked, the ruin less complete.

When, as in a few examples observed, the masonry was of the best class (and such as would be so recognized in England), the buildings thus constructed stood absolutely uninjured in the midst of chaotic ruin.

As a striking illustration of the exception just alluded to, Mr. Mallet draws particular attention to the Campanile of Atena—a square tower, of about ninety feet in hight and twenty-two feet square at the base—in which there was not even a fissure, while all around was nearly prostrate. This tower was also aided hy iron chain bars, built in at each story. The great viaduct carrying the military road at Campostrina is adduced by the writer as another example of like character. He appends, also, the following remarks, which, owing to the strong parallel case which may he drawn between the effects of the great Neapolitan earthquake of 1857 and that of the 21st of October, 1868, at San Francisco, I now insert in small capitals:

"INDEED, IT WAS EVIDENT THAT HAD THE TOWNS GENERALLY BEEN SUBSTANTIALLY AND WELL BUILT, OR, RATHER, THE MATERIALS SCIENTIFICALLY PUT TOGETHER, VERY FEW BUILDINGS WOULD HAVE BEEN ACTUALLY SHAKEN DOWN, EVEN IN THOSE LOCALITIES WHERE THE SHOCKS WERE MOST VIOLENT AND THEIR DIRECTION THE MOST DESTRUCTIVE. THUS THE FRIGHTFUL LOSS OF LIFE AND LIMB WAS AS MUCH TO BE ATTRIBUTED TO THE IGNORANCE AND IMPERFECTION DISPLAYED IN THE DOMESTIC ARCHITECTURE OF THE PEOPLE AS TO THE UNHAPPY NATURAL CONDITION OF THEIR COUNTRY, AS RESPECTS EARTHQUAKES."

THE "CALIFORNIA NUTMEG."—The tree referred to as the "California nutmeg," in an item from the San Mateo *Gazette*, is the *Torreya Californica*, named after Prof. Torrey, and originally found in this State, a dozen or fifteen years ago, subsequently also in Florida and Japan. It is of the pine family,—a very different one from that of the true nutmeg. The fruit is aromatic, but somewhat of a turpentine nature, and the flavor is entirely different from that of the true nutmeg. The latter has a fleshy covering, and a hard seed inside. For a description of the *Torreya* see Pacific Railroad reports, under Newberry's notes. The Nevada *Gazette* says: "It seems there are two varieties of the tree, differing slightly in appearance and in the color of the fruit. In hight they vary from ten to twenty feet, and rarely exceed ten inches in diameter. Our informant states that he has used the nut as a substitute for nutmegs for a number of years past, and cannot detect any difference in the taste or quality of its flavor." Perhaps there is something in a name.

PERFUMES EXTRACTED FROM FLOWERS BY GLYCERINE.—The old method of extracting the more delicate perfumes was by means of fat, which absorbed the volatile oils, and whence they were dissolved out with alcohol. By the new plan, the flowers are introduced into a vessel filled with glycerine; and after some three weeks' time the glycerine is strained off. The odoriferous extract which it has taken up may easily be communicated to either water or oil.

Mechanical.

Welding Copper.—This has been difficult because the oxide formed is not fusible. But a salt containing free phosphoric acid renders it easily fusible. Mr. Rust experimented with microcosmic salt, which is a phosphate of soda and ammonia, and succeeded perfectly. A mixture of one part phosphate of soda and two parts boracic acid answers nearly as well, and is much cheaper. This welding powder should be strewn on the surface of the copper at a red heat; the pieces should then be heated up to a full cherry red or yellow heat, and brought immediately under the hammer, when they may be as readily welded as iron itself. For instance, it is possible to weld together a small rod of copper which has been broken; the ends should be beveled, laid on one another, seized by a pair of tongs, and placed, together with the latter, in the fire, and heated; the welding powder should then be strewn on the ends, which, after a further heating, may be welded so soundly as to bend and stretch as if they had never been broken. The greatest care must be taken that no charcoal or other solid carbon comes in contact with the points to be welded, as otherwise phosphide of copper would be formed, which would cover the surface of the copper and effectually prevent a weld.

Timber Beasts.—Under this head *The Engineer* describes the ingenious manner in which the quadrupeds that stock the thousands of "Noah's Arks" are made, in Saxony. The ridiculously low price at which these toys are sold, is now more easily accounted for. A block, in length equal to the hight of the intended image, is cut off from the end of a wooden cylinder. From this block a ring is turned, the various moldings of which make it resemble a circular picture frame. The forms of the moldings seem to be determined simply by the caprice of the workman at the lathe; but when finished, a section of the ring is a perfect outline of the particular beast desired. The whole ring is then cut up with a saw; every cut producing an image. Tails and horns are afterwards added where required.

Breaking of Rails in Cold Weather. Mr. Colburn's theory is that this is due, not so much to the non-elasticity of the sleepers, as has been generally supposed, as to the freezing of the moisture contained within the pores of the iron itself. In this connection he says: "It is a question how far the great expansion of zinc, tin, and lead, indeed of all the more fusible metals when heated, is due solely to their low cohesive resistance, or to the expansion of interstitial moisture acting against a comparatively small resistance."

To Horse Shoers.—The "frog," should never be cut. It is intended as a cushion and protection to the foot. Yet blacksmiths delight to cut it away, and keep an instrument on purpose. No man "who knows," will allow his horse to be meddled with by a shoer who uses that barbarous shovel-shaped knife, with which, braced against the shoulder, this important portion of the hoof is so ruthlessly slashed away by so many farriers.

Iron and Steel Crystals.—Mr. Schott, of Ilsenberg, has made many microscopical examinations of the structure of steel and iron. He maintains that "all crystals of iron are of the form of a double pyramid, the axis of which is variable, as compared with the size of the base. The crystals of the coarser kinds, as compared with those of the finest qualities of crystalline iron, are of about twice the hight. The more uniform the grain, the smaller the crystals, and the flatter the pyramids, which form each single element, the better is the quality, the greater is the cohesive force, and the finer the surface of the iron. These pyramids become flatter as the proportion of carbon contained in the steel decreases. Consequently, in cast iron and in the crudest kinds of hard steel the crystals approach more the cubical form, from which the octahedron proper is derived, and the opposite extreme or wrought iron has its pyramids flattened down to parallel surfaces or leaves, which in their arrangement produce what is called the fiber of the iron. The highest quality of steel has all its crystals in parallel positions, each crystal filling the interstices formed by the angular sides of its neighbors. The crystals stand with their axes in the direction of the pressure or percussive force exerted upon them in working, and consequently the fracture shows the sides or sharp corners of all the parallel crystals. In reality, good steel shows, when examined under the microscope, large groups of fine crystals like the points of needles—all arranged in the same direction and parallel."

Electro-Magnetic Marine Engines.—A correspondent of *The Engineer* has an idea that the galvanic action of salt water upon the sheathing of a vessel may be utilized toward the propulsion of the vessel. We quote sufficient to give an idea of his plan:

"A vessel to be fitted with an electro-magnetic engine attached to an ordinary screw shaft, is sheathed on one side with copper, and on the other side with zinc. The sheathing is laid on over sheets of gutta percha in order to insulate it from the woodwork of the vessel. The nails necessary for this purpose are driven in such a manner that they are nowhere in metallic contact with any part of the sheathing. The two sections of copper and zinc sheathing thus form a battery, acted upon and excited by salt water alone. The vessel being so sheathed, a wire from each section conducts the current to the electro-magnetic engine. In my first experiments I had a large magnet to work a keeper in connection with a crank in the usual way. Since then I have adopted a mode of multiplying the power enormously. Thus—the wires are connected with a thick, small-sized electro-magnet in the first instance. In front of its two poles an armature is made to rotate with great velocity, and the augmented current thus produced is carried to an arrangement of two very large magnets working reciprocally in such a way that the keeper, or soft iron beam between them, which works the crank axle of the screw, flows the current into each separately at every stroke, charging it just before the moment of contact. In fitting the above engine to a vessel the rotating armature working before the first magnet would have to be driven by a small steam engine."

"No-Pressure" Engines.—A correspondent of the *Artisan* says he is endeavoring to organize a company to carry on the business of making engines constructed upon the theory that "the lower the temperature the less vapor will fill the water-end of the cylinder, and the more readily it will be liquefied in the condenser, and so the quicker it will be returned to the boiler; and, as a result, any change either for *water* or *fuel*—any boiler strain, or capacity, beyond that which is required to gasify the charge of liquid resulting from the condensation of a cylinderful of steam—is so much *useless incumbrance*."

He says that "with an engine properly constructed, a two-thousand-ton steamer while crossing the Atlantic ocean will use less than one hogshead of water for the entire passage, with boiler weighing less than five hundred pounds, and with less than one-half of the same fuel the same trip would require with the old style boiler."

Water Wheels.—The usual velocity of the periphery of overshot and high breast wheels is from three to six feet per second; and their available efficiency when well designed and constructed is from 0·7 to 0·8 of the total power of the fall. The diameter of an overshot wheel must be a little less than the hight of fall of the water, and that of a high breast wheel somewhat greater.

Leakage in Tube-sheets.—Excessive leakage in the end of tubes is a sure sign of an accumulation of dirt behind the tube-plate; this dirt being first removed, the tubes can be made tight by judicious caulking; continual caulking is, however, very injurious to the tubes and plate, and whenever this fails, the ferule should be withdrawn and replaced by one slightly larger in diameter. *Am. Artisan.*

Metallic Ceilings.—A system of metallic ceilings, consisting in the application to the joisting of very thin, stamped ornamental panels, has lately been invented. They can be readily fitted to any kind of ornamentation or color.

Scientific Miscellany.

Birds of Vancouver Island.—Robert Brown, F.R.G.S., has contributed to "*The Ibis*" a synoptical list of the ornithology of Vancouver Island, having devoted over four years of time to that and kindred subjects, in the capacity of commander and government agent of the Vancouver Island, and botanist of the British Columbia, Exploring Expeditions, which have been doing very good service in extending our knowledge of the resources of the North. This list is intended mainly as a guide to collectors, of whom there are several deserving of very favorable mention; and has been published separately in pamphlet form. The character of the birds will be understood from the following summary:

	Tribes.	*Genera.*	*Species.*
1. Raptores (Robbers),	3	12	14
2. Scansores (Climbers)	1	4	6
3. Incessores (Perching)	17	51	66
4. Rasores (Scrapers)	3	5	5
5. Grallatores (Waders)	7	16	18
6. Natatores (Swimmers)	7	30	44
Total	38	118	153

To detect a false Diamond.—Professor Levi says the following method is infallible: Place the stone in a platinum crucible, with pulverized fluor spar, add concentrated sulphuric acid, and heat. When the vapors of hydrofluoric acid cease, allow it to cool. If the stone is found intact, it is a true diamond. Not otherwise; for if false, its silicon will have united with the hydrofluoric acid, and it will either disappear entirely, or be found extensively corroded.

Another German Polar Expedition.—The second German Expedition will probably leave Bremerhafen early in June. It will consist of two vessels, the Germania and the Grænland. The first is a screw steamer; the second a sailing yacht. This yacht will return before next winter, while the Germania will push on, and winter as far north as possible.

Phosphorus and Turpentine.—M. Personne has found that terebinthine, the principle of turpentine, is an antidote to phosphorus. It is remarkable that while this substance prevents the solution of phosphorus in the stomach, it also impedes its combustion in the air.

Velocity of the Electric Impulse.—The discordant results that have been arrived at by experimenters upon this subject, have been due to imperfect apparatus. Give the current a conductor that offers no resistance, or put on battery power enough to overcome the resistance,, and electricity will probably be found able to hold its own with light. As an evidence that an increase of battery force increases the speed may be instanced an experiment lately made by Prof. Hough, of Dudley Observatory. Over a circuit of 1,000 miles of wire, with 75 cups of battery upon one end and 45 cups at the other, he obtained a speed of 12,200 miles a second. By increasing the battery to 90 cups at one end and 75 cups at the other, he increased the velocity to 14,400 miles a second.—*The Telegrapher.*

Guano—New Theory.—The *Bulletin* of the Essex Institute, a new publication which is to take the place of the "Proceedings, etc." heretofore issued, gives in its first number some remarks made at a recent meeting of the Institute by Prof. A. M. Edwards upon the subject of guano. Prof. Edwards advances the theory that guano is not the droppings of birds, as has generally been supposed, but is the deposit of the remains of dead animal and vegetable matter at the bottom of the ocean, which, as the coast rose, had been so lifted as to appear on the crests of the islands formed, and from the chemical changes it had undergone, had become guano. Among other facts brought forward to prove his theory, he mentioned that an island had risen at the Chincha group, which contained guano on its summit at the time of its uprising. He also alluded to the fact that the droppings of birds would be quite inadequate to supply the vast amount of guano found, and that such droppings were chemically distinct from guano.

The Stars a Source of Heat.—Strange as it may seem, the stars furnish the earth an appreciable amount of heat. The London *News* says: "Mr. Huggins has just published the results of a series of inquiries addressed to the actual measurement of the heat which we receive from the leading brilliants of the nocturnal sky. The galvanometer was made use of in these investigations. The instrument was fixed by Mr. Huggins' large refractor, so that the image of a star formed by the eight-inch object glass might fall upon the surface of the thermopile. When the time came for making an observation, the shutter of the dome was opened, and the telescope was turned upon a part of the sky near to some bright star, but not actually under it. Then the needle was watched to determine whether the change of position had produced any effect. If, in four or five minutes, no signs of change were shown, the telescope was moved over the small distance necessary to bring the image of the star directly on the face of the pile. Almost always the needle began to move as soon as the image of the star fell upon it. The telescope was then moved slightly away again from the star; the needle was seen to return to its place. In this way from 12 to 20 observations would be made upon the same star, so that no doubt might remain as to the motion of the needle being really due to the star's heat. In this way, it was found that Arcturus moved the needle three degrees in a quarter of an hour. So did Regulus. Pollux gave a deflection of one and a half degrees; but, singularly enough, his twin brother, Castor, produced no effect at all upon the needle. The splendid Sirius gave deflection of only two degrees; but as this star is always low down, and shines through a greater proportion of the denser atmospheric strata, it is not surprising that its heat should not be proportioned to its brilliancy."

How to Preserve Algæ.—In the May number of the *American Naturalist*, Arthur M. Edwards describes a new method of preparing specimens of filamentous Algæ for the microscope. He makes a solution of chloride of soda in the following manner: A large excess of fresh chloride of lime is put in water. After being well stirred, it is allowed to settle; and to the clear liquid is added a concentrated solution of carbonate of soda,—common washing soda,—until the carbonate of lime ceases to be precipitated. The clear liquid resulting, is preserved in a well corked bottle, away from the light. In this solution the Alga is boiled for a few minutes; and after being thoroughly washed with distilled water, it is put in a bottle of water to which a few drops of creosote have been added. Weak spirits may be used instead; in which case, however, creosoted water is employed when the specimen is mounted for use. Instead of the chloride of soda thus prepared, the well known *Labarraque's Solution* may be used; but it is scarcely strong enough for some cases.

Glycerine for Preserving Specimens of Marine Animals.—Professor Verrill of Yale College uses glycerine for this purpose. He says that not only are the brilliant colors of the specimens perfectly preserved thereby, but the internal parts as well. Very heavy glycerine is used, and the specimens transferred to a fresh supply as fast as they give out water enough to weaken it in any great degree. Some of Prof. V's specimens, which were killed by immersion in alcohol, and the colors of which were thereby deadened, had their brilliancy completely restored by the glycerine. Some colors, however, are destroyed by alcohol. In such cases, it must not be used, but the specimen must be put at once into the glycerine.

Combinations of Acids with Alcohols. Berthelot, the eminent French chemist, makes a calculation of the number of combinations which may be made of acids with certain alcohols. He says, "if you give each compound, thus possible, a name, and allow a line for each name, and then print 100 lines on a page, and make volumes of 1,000 pages, and place a million volumes in a library, you would want 14,000 libraries to complete your catalogue."

Maturity of Wines.—Dr. Dupré, lecturer on chemistry at Westminster hospital, states in a paper, recently published, that pure natural wine may be considered to have arrived at maturity at the end of from five to twelve years. In that time, the slow chemical changes which bottled wine undergoes will have produced their best effect; and after that, "the wine no longer improves by keeping, except to the taste of a few would-be connoisseurs."

Inventions and Patents.

New Patents Issued to Pacific Coast Inventors.

From Official Reports to Dewey & Co., U. S. and Foreign Patent Agents and Publishers of the Mining and Scientific Press. Copies of any U S. Patent Claims furnished immediately for $1. Full copies of American or Foreign Patents can be obtained by telegraph or mail through this office.

For the Week Ending May 4th.

Stove Drum.—F. Stadter, Plattsmoutb, Nebraska.—89,698.

I claim the conical drum A, and spiral cone E on the shaft B, arranged and operating substantially as shown and described, for the purposes set forth.

Self-Discharging Blanket Ore Concentrator.—John M. Bryan, Lincoln, Cal. 89,734.

I claim, 1. The adjustable swinging frame B, rollers D, E, and G, canvas belt L, and tank K, the whole arranged substantially as and for the purpose herein described.

2. The frame B, rollers D, E, and G, and swinging bar N, in combination with the ratchet-wheel F and pawl *e*, the whole arranged to operate substantially as and for the purpose herein described.

3. Passing the pulps across a revolving canvas belt from side to side, substantially as described.

This invention relates to an improved conceutrator for separating sulphurets from the pulp or tailings, after it has passed tbrough the batteries, and consists in arranging a broad canvas, endless helt on rollers, and placing across the top of the blanket a third roller, whicb causes a depression in the top of tbe blanket. The rollers are arranged on a swinging frame and are operated hy a ratchet and pawl. The pawl is caused to engage tbe teeth of tbe ratchet hy the swinging of the frame. The pulp is fed upon tbe canvas at one side aud passes across it, leaving tbe sulphurets clinging to thc canvas, whence they are deposited in a trough hencatb.

This macbine was illustrated and fully described in our issue of January 16, 1868.

Seed Sower.—George H. Crocker, Marysville, assignor to himself and David L. Smitb, San Francisco, Cal.—89,739.

I claim, 1. The rock-shaft D and fingers *e e*, in combination with the peculiarly-constructed cam *h* and lever *l*, and the connecting-rod *n*, substantially as set forth.

2. The dctachable pole R, provided with the opening *r*, band X, and ring *v*, substantially as and for the purposes set forth.

This improved seed sower is more particularly desigued to be used for sowing grain which requires to be sown broadcast upon tbe field. Tbe advantages claimed for this over otber seed sowers are, First—Tbe grain can he dropped more evenly tban witb any other sower, on account of the peculiar arrangement for feeding the grain regularly, and preventing tbe openings through which it passes, from becoming clogged; and, Secondly—The cost of construction, which is redneed to a mere fraction of wbat is usually cbarged for aeed sowers. Tbis device can he readily attached to the Randall Rake, when desired, without any cbange in the construction of either, thus rendering the rake of douhle utility to farmers. With this implement it is claimed tbat a lad of twelve years can, hy first having the sower arranged, do all the work that is necessary for sowing and barrowing a field.

Divided Axle for Railway Cars.—David Brown Hunt, San Francisco, Cal.—89,767.

I claim the collar C, secured on the end of one part of the axle, in combination with the sleeve-piece B, secured to the other part of the axle as a means of keeping the divided axle together.

Propeller.—Alfred C. Loud, San Francisco, Cal.—89,777.

I claim a propelling-whcel, so constructed as to exert its propelling power against the water, by means of four or more rings, or rims *b b1 b2 b3*, arranged obliquely with reference to the shaft, and intersecting each other, as described.

Gang Plow.—Maurice Murphy, Vacaville, Cal.—89,788.

I claim, 1. In combination with the arm, or lever C, rigidly fixed upon the crank for raising the plow-frame, the adjustable connection of the crank E to the axle, by a polygonal pin and corresponding eye, substantially as and for the purpose set forth.

2. The low convexed share F, having the extended point *c*, and the eye, or socket H, constructed substantially as and for the purpose described.

3. The mold-boards J, when constructed with the surface curved, as described, and having the convexed edge *d*, substantially as herein described.

This invention relates to certain improvements in gang plows, and consists first, in so attaching tbe supporting frame of the plows to a bent or crank axle that the depth to whicb it is decided to cut on every piece of land is easily regulated, and varied from two to ten inches. It also consists in a novel construction of the share and mold-board, by whicb a mucb greater efficiency and ease in cuttiug and laying tbe furrows is attained. The first part of this invention consists in supporting the frame of the plows upon a crank axle, a suitable lever heing attached by which to raise and lower the same. The land wheel turns upon an axle which has a half crank, that has its eye made polygonal and fitting on a similarly formed pin, the nnmher of sides being determined so that the plows shall have three or more different levels on which to work. The share is constructed long and low, but convexed slightly above. The mold-hoard commences at the hase of the sbare, heing made considerahly narrower, and its lower edge is convexed or curved under, the curve gradually changing so as to be concave near tbe top. The standards are cast in such a manner as to he easily renewed when they wear.

Side-Hill Plow.—Ives Scoville and Hiram H. Scoville, Oakland, Cal.—89,796.

We claim, 1. The angularly-placed removable axes *a*, arms *b b* and *c c*, for clevating and lowcring the mold-boards, and holding their position, substantially as described.

2. The lever C, hooks *e e*, rod *g*, and bar *h*, operating in the slotted standard E and slots *i*, the whole arranged substantially as and for the purpose described.

3. The two plows A and B, operating independently of each other, and turning up against opposite sides of the bcam, and mounted on the angularly-placed axes *a a*, substantially as described.

Tbis inventiou is a modification of the class of plows known as side-hill plows, and consists in providing two mold-boards, one to be used to convert the implement into a right-hand plow, while the otber converts it into a left-hand plow. In this device, the mold-hoard, which is not in use, is turned up against the plow beam, on the opposite side from the plow to be used, and locked in tbat position by a lever, which operates a har that in turn locks tbe plow to be used in its proper position on the standard. It also embraces the attacbment of tbe handles of the plow to a metal har whicb rises from tbe rear of the landside. The plows are operated independently, and are mounted on sbafts whicb stand at an angle to each other. Eitber of the mold-boards can he removed, and thus leave tbe plow single.

Process of Removing Soluble Matter from Artificial Stone.—Edward T. Steen and William B. May, San Francisco, Cal.—89,805.

We claim purging soluble substances from artificial stone, in the manner substantially as above described.

This invention relates to a new and improved method or process for removing salt and otber soluble impurities from artificial stone, and more particularly from that known as Ransome's Concrete, for huilding and otber purposes.

Means for Hanging Window-Shades.—John I. Tay, San Francisco, Cal.—89,813.

I claim the combination and arrangement of the cords *b*, *n* and *n'*, the tension-spring *d*, and the rollers C, when applied to both ends of a curtain, so that the top may be rolled down, and the bottom rolled up, and each sustained at any desired hight, by means of the weights I I', substantially as described.

Tbe design of this invention is to provide an improved mode of hanging shades or curtains in front of windows. It consists in swinging tbe curtains in front of the windows hy means of cords which pass around the ends of rollers attached to each end of the sbade or curtain. The cords are so arranged tbat tbe curtains cau be raised or lowered at the hottom or top, as desired, hy simply adding to or relieving a weight attached to their ends.

Combination-Lock.—Ephraim Vorhe, San Francisco, Cal.—89,817.

I claim, 1. The combination of the stem *c'*, holding-plate *k'*, and socket-stem D, substantially as described.

2. The stop R1, with the catch *r*, the sliding-plate *r'*, and spring T, for holding and releasing the stop, substantially as and for the purpose herein described.

3. The tumblers N O P, with the lugs *n n n*, the arm *p*, the wheels Q R S T, and the lever Z, the whole operated from the knob E, for retreating the stop R1, substantially as described.

4. The device for controlling and operating the bolt, consisting of the rotating case V, the plate *u*, with its arms 1, 2, and 3, the spring V', the stems *k k*, and the key M, together with the slotted segment *w*, the whole connected and operated substantially as herein described.

This invention is a modification of that class of locks, known as combination locks, and generally used for hanks and safes. It consists, First—Of an improved manner of setting the tnmhlers and operating the bolt; and, Second—Of a stop for the holt, which is operated by a lever and a series of toothed wheels, whicb are in turn opcrated by an arm on the tumbler sbaft. The bolt is operated by an iudependent knob, having an opening into wbich a key of peculiar construction must be introduced. Tbis key presses back a numher of small arms, by means of spindles, so that tbey will move in grooves, in a circular arc, and thus allow the knob to he tnrned and the bolt moved. These toothed wheels are set before locking tbe safe, so that if tbe combination is not made correctly at the first trial, the stop will be forced out, and preveut tbe holt being moved. By means of tbe wheels and tbe lever before mentioned, tbe stop will be forced hack into its place, when a second trial can be made, and the bolt can be drawn, if the combination is correct. But if a second mistake is made, the stop cannot again he forced hack, till tbe last toothed wbeel has been turned half round, which would necessitate an immense numher of turns of the knoh.

For the Week Ending May 11th.

Buckle.—George W. Roland, Salem, Oregon.—90,026.

I claim, as a new article of manufacture, the clasp for securing harness or other straps, constructed substantially as specified and described.

California Academy of Sciences.

A regular meeting of the Academy took place on Monday evening, May 17th, hut was very slimly attended, owing to tbe absence of several active members on "collecting" excnrsions. H. Heyneman was elected a resident member.

Newer Geological Formations in Eastern Nevada.

Gregory Yale exhihited a picce of sandstone containing innumerable fossils, apparently of tertiary age, from the summit of a high mountain in easteru Nevada—he understood from Treasure Hill. In spots the sandstone was said to contain chloride of silver. One spot so marked was of sandstone in tbe inside of a mussel shell. He also donated a specimen of fossiliferous limestoue containing corals, from White Pine District. Also a copy of Raymond's Report on the Mines of the West of 1869, and a rare old map of Paris in 1778.

Henry Carlton described eigbt additional species of shells from near Autioch, collected by Mr. Rowell.

Tbe subject of raising funds to build, was again raised hy Mr. Yale. Members of tbe Academy, he said, represented some $3,000,000, most of which money had been made in this country. He thought it wonld he no difficult task to obtain $30,000 for huilding purposes.

Prof. Davidson stated that for tbe last fifteen years the Academy in Philadelphia had tried to raise $100,000 for a building, hut that tbey had not been able to obtain more than $20,000 of suhscriptions.

Mr. Yale was authorized to examine and report upon condition of the outside land which had heeu set apart hy the Board of Supervisors for tbe use and ownership of a scientific Society.

California Medical Gazette.—We acknowledge the receipt of the May number of this periodical from tbe puhlishers, Messrs. A. Roman & Co. It contains a number of original articles, hesides the usual selections from tbe current medical literature. Mauy of these selections are upon subjects which are of general interest to the reading public. We mean by tbis simply that they are less tecbnical in tbeir character, than tbose more especially prepared for the professional reader;—uot that the latter do not also concern the geueral public. On tbe contrary, we consider that every individual in tbe community is directly interested, and that deeply, in every good article that is published, relating to the progress of the ever-advancing, never-to-he-perfect, healing art,—and, consequently, in the support of every good medical journal; for it is only by the aid of such journals that tbe physician in active practice can keep himself "posted" in sucb progress, and be enabled to give the general public the benefit tbereof.

The Workshop, a montbly journal devoted to tbe progress of the mechanical and useful arts, has reached its second volume, with every indication of a prosperous future. This periodical is a German publication, issued in German, French and Englisb—the Americau agent heing E. Steiger, 17 North William street, New York. It is in quarto form, and gives descriptions and designs, profusely illustrated, for nearly all classes of trades; likewise illustrations of approved new machinery, and essays on style and art in the trades, etc., etc, The *Workshop* is a very valuable publication, and is offered at $5.40 per year (currency).

Company Transactions.

New Incorporations.

New articles of incorporation bave been filed, as reported in our exchanges during tbe past week, in the Conuty Clerk's office in this city, the Secretary of State's office at Sacramento, etc., as follows:

Mining Companies.

Clyde M. Co.—May 14th. White Pine. Capital stock, $400,000; 4,000 sharea. Trustees: J. B. Bidleman, E. Fitzgerald, A. J. Ellis and H. W. Schimp.

Keystone Consolidated M. Co.—May 14th. White Pine. Capital stock, $1,920,000; 19,200 sharea. Trustees: Robert Apple, N. Remillard, J. B. Gagnois, L. M. Beaudry, O. Lamarcbe, T. Lafleche, and C. Peter.

Meadow Valley M. Co.—May 14th. Meadow Valley, Nevada. Capital atock, $6,000,000; 60,000 sbares. Trustees: L. L. Rohinson, Henry A. Lyons, Lafayette Maynard, C. D. O'Sullivan, Delos Lake, Michael Skelley, D. J. Oliver, E. D. Keyes and J. T. Boyd.

Baltimore and Oregon M. Co.—May 17th. Gold Hill, Nevada. Capital stock, $2,500,000; 50,000 sbares. Trustees: G. B. Reeve, A. K. Grimm, G. W. Prescott, J. P. Jones and A. W. Baldwin.

Consolidation M. Co.—May 17tb. Reveille District, Nevada. Capital stock, $2,000,000; 20,000 shares. Trustees: J. B. Harman, F. G. Smith, C. S. Smith, W. T. King and C. J. King.

Mammoth Cave M. Co.—May 15tb. Wbite Pine. Capital stock, $2,000,000. Trustees: W. K. Dietrich, J. E. Foye, H. C. Coulson, C. V. Chesley, J. H. Gager, G. A. Ball and A. Buswell.

Miscellaneous.

Iron Molders' Co-operative Association.—Object: The manufacture of machinery and tbe carrying on of a general fouudry husiness. Capital stock, $250,000; 10,000 shares. Trustees: Dennis R. Manning, G. Pentington, Henry Wehb, W. Franey and T. Mitchell.

Sanct Paulus Kirchen-Verein of the City of San Francisco.—Sacramento, May 15th. Capital stock, $30,000.

Seventy-Five Dollar Lot H. A.—Tract of eighty acres of land situated on the San José Railroad, near School-House Station. Capital stock, $72,000. Trustees: Milton S. Latham, Gustave Mahe, Eugene L. Sullivan, W. B. Johnson and J. C. Duncan.

Meetings, Elections, Etc.

Mining.

Etna S. M. Co.—S. F., May 16th. Trustees: John Nightingale, John Gillig, James O'Neil, J. Pritchard and Peleg Bumpus.

Edith S. M. Co.—S. F., May 16tb. Trustees: R. E. Sherwood, John Nightingale, James O'Neil, J. D. Littlefield and John Gillig.

Rising Star M. Co.—S. F., May 16tb. Trustees: The President, M. J. McDonald, Lloyd Tevis and Thomas Bell.

Ion M. Co.—S. F., May 17tb. Trustees: Peter Taylor, W. K. Dietrich, H. Casanova, A. W. Perley, W. W. Merrihew. Subsequently Peter Taylor was chosen President; W. K. Dietricb, Treasurer; G. A. Ball, Secretary.

Tecumseh G. S. & C. M. Co.—S. F., May 19th: President, J. G. W. Schulte; Treasurer, M. Fenstermacber; Secretary, W. H. Mosher.

Gold Hill Miners' Union.—Virginia City. Trustees: A. T. Atkinson, Daniel M. Gloster, Tbomas Kelly and John Miller. T. A. Atkinson, President; Daniel Gloster and Thomas Kelly, Secretaries.

Homesteads.

Noe Garden Homestead Union.—S. F., May 14th. President, George Cofran; Secretary, John S. Luty; Treasurer, Nathan Atkinson; Directors: R. P. Franklin, W. R. McKee, Robert Mayers, Geo. S. Crim, J. P. Allen, W. G. Doolittle and John W. Quick.

Paul Reservation H. A.—S. F., May 19th. Officers: C. D. Wheat, W. D. Doolittle, Jobu Henderson, Jr., W. G. Finch, A. C. Morse, W. A. Robertson and H. D. Sbelden.

Miscellaneous Enterprises.

McMinnville (Oregon) Water and Manufacturing Co.—McMinnville, May 12th. Board of Directors: W. Townley, N. L. Strange, I. M. Johns, W. L. Olney, and J. F. Bewley. President, W. T. Newberry.

Ellendale Woolen Manuf'g Co.—Ellendale, Oregon, May 8th. Directors: R. P. Boise, — Levins and Ben. Simpson. Judge Boise, President; and Judge Moore, Secretary.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

San Francisco, May 22, 1869.

Financial.

From the Commercial Herald we take the following:—Our local money market is working with almost accustomed regularity and ease, as—for the purposes of legitimate business—there is no difficulty in obtaining accommodation needed at 1¼ ₱ cent. per month; but loans for speculative objects hang fire. There is a strong disposition evinced to quash all movements in that line unless they are based on solid foundations. The savings and loan societies are making no loans at present. The number of homestead associations is so great, and the inducements they put forth to invest in lots are so captivating, that tens of thousands of dollars are weekly absorbed by them. The fever has got entire control of nearly the whole laboring population, who place most of their surplus earnings in lands instead of the usual public depositories. Large sums are also expended for the prosecution of extensive improvements going on all over the city; but the drain for prosecuting work on the Central Pacific Railroad will soon stop.

The Pacific Railroad affords increased freight accommodations since the urgent requirement for railroad materials has been greatly diminished. This city will soon experience a rush of visitors from the East, especially as the year has so far advanced that traveling unites pleasure with business. The time has at length come when the understandings of Eastern people will be enlightened relative to the Pacific slope, a matter upon which millions have been greatly ignorant despite the perpetual lessons and unceasing teachings placed directly under their eyes. We anticipate a new and brisk trade in many articles so soon as the Pacific Railroad shall be placed in complete order for fast express trains, and the rates reduced to the lowest paying figure. Fresh fruits, vegetables, salmon, etc., will some day find their way from this city to Chicago, Cincinnati, St. Louis, New York, and other Atlantic cities, which will give us return supplies of oysters, etc. We shall furnish all the goods imported from ports in the Pacific and Indian Ocean and China Sea, while those imported from countries washed by the Atlantic and Mediterranean will be furnished from the other side to all interior points.

We tender our acknowledgments to Mr. J. M. Good for the official Public Debt Statements for April and May, from which we condense the following:

	May.	*April.*
Coin Debt	$2,107,858,700	$2,107,876,650
Currency Debt	67,240,000	68,695,000
Unpresented Matured Debt	5,241,314	6,063,403
Debt Bearing no Interest	407,721,368	414,413,485
Total Principal Outstanding	$2,583,541,382	$2,596,998,538
Accrued Interest	46,491,506	39,305,917
Total, Principal and Interest	$2,635,032,888	$2,636,202,455
Cash in Treasury	116,235,497	111,005,994
Debt less Cash on hand	$2,518,797,391	$2,525,196,461

The decrease during the month of April was $6,399,070. This is a very gratifying result. The amount of $3,296,790, in the shape of interest, was paid in advance. The total amount of bonds issued in favor of the Pacific Railroad and its Branches is $56,852,320, all of them payable in 30 years from dates. The amount of interest accrued and not paid is $1,130,368, and the amount paid by the United States is $3,310,053, of which $1,380,438 has been repaid by transportation of mails, troops, etc. The balance of interest due the United States is $3,059,983.

City Stocks.

During the past week transactions in securities other than mining stocks have been very limited; in fact, it is quite difficult to realize upon them under any circumstances, in view of the present stringent condition of financial affairs in this market. No note sales of San Francisco Gas stock at $83@82, and Spring Valley Water at $66 per share.

Mining Share Market.

During the week under review the mining share market has been characterized by a good degree of activity, with large sales of a number of prominent stocks, though the tendency as regards most of the leading stocks has been towards lower values. The bullion production continues very fair, and what is at present lost by the unproductive condition of the Gold Hill mines, is more than made up by the bullion receipts from the White Pine region, which is rapidly assuming a position of great importance in the production of the precious metals, and so soon as the mill facilities are increased, will astonish the world.

Hale & Norcross—sold at a very uniform rate during the period under review. The ore statement for the week ending May 15th, shows a yield of 1,019¾ tons from the following points: 175 level, 89; third station, 114¾; fourth station, 514½; fifth station, 301½ tons. During the same period, they delivered to the mills 899¼, leaving on hand 1,043 tons. On the 18th inst., four bars valued at $7,103 were sent forward to the office in this city, being the first shipment of bullion on May account from the French mill. In the upper mine the drift on the 300 level has reached the vein. The north drift on the fifth floor of the 175 level, which is being run into the barren portion of the mine, struck good ore on the 17th inst., the average assays showing $81 93 to the ton, and thus far the drift has penetrated the ore a distance of seven feet. In the fifth level they are continuing the north and south drifts, but owing to the swelling of the ground and the heavy clay walls in both drifts, they are progressing slowly. The various breasts throughout the mine look favorable, and show no particular change from previous reports.

Imperial—shows a very general improvement over transactions of the previous week. To date for the current month $12,831 in bullion has been received. On the 21st inst., the work of sinking the shaft had been done to the extent of seven feet, and continued to carry the east clay. With regard to this work, the Gold Hill *News* remarks: The Imperial and Empire companies are now sinking their new shaft deeper. The pump is cleaned out and the shaft and other arrangements put in order for the purpose. The shaft is 1,104 feet deep, and the bottom of it is just cutting the east clay wall of the old Comstock. As the known dip or inclination of the ledge—45 degrees—is maintained at that point it will take at least 200 feet of perpendicular sinking in order to reach the west wall. Within that distance some good bodies of ore must certainly be encountered, and most probably that demonstrated to exist at the lower levels of the Yellow Jacket which tends in that direction. At the 1,000 and the 1,080 (generally designated as 1,100) levels from this shaft the ledge has been pretty thoroughly explored between the east and west walls, and nothing found more encouraging than harren quartz and porphyry, therefore it is about high time that deeper sinking was done. In no other possible way could the ledge be prospected so thoroughly or to so good advantage at that point as in sinking straight down through it, thus literally prospecting it in all directions at once. The machinery of the hoisting works at the surface is amply powerful and sufficient to carry the shaft to the depth of 1,500 feet, and we certainly hope the trustees of the company will have the good sense to keep the shaft sinking until ore, chloride or lava is struck.

Chollar-Potosi—exhibits a material advance under very considerable sales. For the week ending May 14th, 1,460 tons of ore were extracted, and 1,462 tons sent to the enstom mills for reduction. The ore found in the Blue Wing stope shows an improvement and an increased amount was extracted for the period under review. This is also the case with the New Tunnel deposit, which promises well for the future, owing to the ore making north from a point that has been barren. In raising from the track floor in the southwest drift samples taken indiscriminately give an average assay value of $120 per ton. Nothing encouraging from the new shaft. Four mills are now employed by this company.

Gould & Curry—declined from the prices ruling early in the week, under limited sales. They have stopped sinking, and are now thoroughly timbering the shaft prior to opening a station at a point twenty-five feet from the bottom, from which they will drift eastward.

Yellow Jacket, Kentuck and Crown Point have been in the market to a more than usual extent, particularly Yellow Jacket, and at prices somewhat less than were obtained early in the week. The Yellow Jacket is being worked as usual, and operations will soon be fully resumed in the other claims.

On the 12th inst., the drift from the Ophir shaft had attained a distance of 298 feet. An assessment of $3 per share was levied by this company on the 18th inst.... Overman levied an assessment of $20 per share on the 15th inst. .... Justice and Independence, on the 10th of May, levied an assessment of $5 per share.... Pocohillo (White Pine) levied its first assessment, amounting to $1 per share, on the 17th instant.

The Aurora Consolidated (White Pine) yesterday commenced the shipment of fifty tons of ore, says the *News* of the 13th, taken from the Last Chance shaft, to Staple's new mill below Shermantown. It is to be run through on the wet crushing plan, and mainly for the purpose of testing the practicability of reducing the ores of this district by that process. In the event that the experiment is a success, the new mill will probably be kept constantly employed on the same character of ore from the Aurora Consolidated, there being thousands of tons stacked up and awaiting shipment about the several shafts of this company.

We have received from Dewey & Co., Publishers and Patent Agents, a pamphlet entitled "A Treatise on Earthquake Dangers, Causes and Palliatives" by Thos. Rowlandson, Fellow of the Geological Society, London, and late Secretary of the Joint Committee on Earthquake Topics. The work was issued from the press of Spaulding & Barto, in handsome style. We have no room for a more extended notice in this issue, but commend it to all interested in earthquake phenomena, and who is not?

Price, 50 cents, postage paid. Address Dewey & Co., Mining and Scientific Press.

Red Currants and cherries have appeared in the San Francisco market; prices 40 cts, cherries from 15 to 75 cents per lb. Strawberries are 7 to 10 cts.

New York Copper Market.—Winterhoff's Metal Circular of May 5th says that for the previous month copper advanced gradually under a fair demand for consumption from 23¼c to 24c for Lake. At this price between 4,000,000 and 5,000,000 pounds have been sold for summer delivery. As high as 24¼c has been paid for deliveries in June and July. A few export orders are in market, and sales for Europe have been made at 23⅞c for Tennessee and 24¼c for Detroit. On the other hand, 100 tons Quincy had arrived from Havre. The London market is improving.

Two World-Wide Triumphs.—It is seldom that one firm is fortunate enough to introduce two staple articles in widely different branches, each of which takes the lead of all others of its class in the markets of the world. This, however, has undoubtedly been the case with Messrs. P. H. Drake & Co., the celebrated chemists and pharmaceutists. Their Plantation Bitters are rated everywhere as the true specific for dyspepsia, biliousness, general debility, loss of appetite and flesh, hypochondria, chills and fever, and lack of vital power and constitutional vigor in both sexes; while their Magnolia Water is the only floral essence that has ever competed successfully for the palm of supremacy with the German Eau de Cologne, of which it is only about half the price. ***

The attention of our readers is called to the card of Dr. Hall, who has just returned from Europe, and had an opportunity of consulting, as will be seen, with many of the most eminent physicians of the world, from whom he was enabled to add much to his store of knowledge, in regard to the treatment of a large class of diseases. ***

The Brazilian Pebble Spectacles purchased at C. Muller, 205 Montgomery street, cannot be surpassed by anything in this line. *

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

PENNSYLVANIA.—*Chronicle*, May 8th: The south drift is in about 40 feet, and the north drift about 50. As soon as they get in 50 feet the ledge will be cut through in both drifts. The ledge is eight feet wide and widening in the north drift. The company is making arrangements for the erection of a mill.

TARSHISH.—Workmen are cleaning out the mine preparatory to the commencement of active operations. N. Graff, the late Superintendent, has been sent for to take charge.

AMADOR COUNTY.

POTOSI.—*Ledger*, May 15th: This mine, located at Drytown, has been purchased by Henry Hinkson and sons, and is now being worked by them. They have recently taken out some very rich rock.

BUTTE COUNTY.

Oroville *Record*, May 15th: Henry White and others are opening a claim on the bluff above that worked by Mr. Heuitt. It is to be a flume extending from the river across the upper end of Montgomery street to the bluff. In both these claims the miners in early days had washed out huge excavations, and worked out different strata of earth; but it has been demonstrated that the hydraulic will prove profitable wherever it can be used in these abandoned grounds. There is room for more claims of the same kind, and we hope to see them in operation soon. Crozier Hill will afford about 100 feet fall, and contains an immense amount of pay dirt.

A correspondent informs us that the quartz mills around Stringtown are progressing finely.

CALAVERAS COUNTY.

RAILROAN FLAT.—*Chronicle*, May 15th: Chapman & Co. are crushing 200 tons of quartz in Smart's mill. It yields an average of $60 per ton.....Sanderson & Co. have out about 150 tons of rock. They will commence crushing as soon as Smart's mill is disengaged.....Work is progressing favorably on the Petticoat. They are making a hole in it as fast as possible....The Lewis Bros. are taking rock from their claim in Wet Gulch, which for richness, beats anything we ever saw. The lead is three feet in width, and shows free gold throughout its whole extent. Having sunk a shaft to the water level, they are now engaged in running a tunnel, which, when completed, will tap the vein at the depth of 200 feet.....The Palomo hoisting works will be ready to commence operations next week....Alexander & Co's mill is kept constantly at work. While others are trying experiments, they are ponuding out metal.

ANGELS.—Three mills are running. Mining interests never looked more favorably than at present.....In the Washington Ranch District several claims are paying well; arastras being used instead of stamp mills. The leads are large and well defined, and the ore yields from $25 to $50 per ton.

Gravel mining appears to be reviving. A great deal of ground which did not yield sufficiently to satisfy the exalted ideas of miners in earlier days, is being worked with profit. New districts are being made. Among the prominent companies in this vicinity we might mention Brackett & Co., Shaw, Hatfield & Co., Paul & Co., Golden Gate Mining Co., Martin & Co., Fields & Co., and Gleason & Co., all of whom are working large numbers of hands and doing well.

The Union Shaft Co. are gaining on the water in their mine.

IRON ORE.—Dr. Hepburn has shown us some samples of valnable iron ore, discovered on the ranch of J. K. Doak, five miles from this place. The ore contains 60 per cent. iron. The lode is large and can be traced for a considerable distance. On the hill is a bold outcrop of the ore, showing a width of 40 feet. Half a mile from this, a shaft has been sunk on the vein ten feet, showing a compact mass of ore ten feet wide. The best of hard wood for charcoal stands immediately round. Within 200 yards of a furnace site is a quarry of excellent limestone.

KERN COUNTY.

SAGELAND.—Havilah Correspondence Visalia *Delta* of May 12th: The Piute mine, owned by C. K. Hotaling and others, near Kelso Canon, has a shaft sunk upon it about 300 feet. But it has been idle since last year, and it is not certain when work will be resumed. The shaft shows a ledge from 3 to 6 feet from top to bottom, and will pay, on an average $10 per ton.

The Gold Hill Company have a ten-stamp mill at Sageland, which has been idle since last fall. The St. John Mining Company is superintended by the owner, Mr. Walker. I can give you the result of ten stamps' working for the past eight days (12 hours each) which was within a trifle of $3,500, and there is plenty more rock of the same sort.

KELSO VALLEY.—The Esperanza Company purchased the Wolfskill mill at Agua Calienta last Autumn, and placed it in such a position that the rock is dumped directly from the mine. They have plenty of rock, and it has averaged $20 per ton. The mill consists of five stamps : five more will soon he added.

KERNVILLE.—Elsworth & DeLand, and Wadleigh & Hntton will start up soon.

The Mammoth Mill, at Keysville, and the Long Tom, on the other side of the Greenhorn Mountain, owned by G. D. Roberts, are not worked, but why, it is hard to tell, unless it is White Pine on the brain.

LOS ANGELES COUNTY.

SOLEDAD MINES.—*News*, May 8th: Jas. A. Hayward, arrived from Soledad on Saturday, bringing 73½ ounces of gold bullion, the product of a seven days' run of a five-stamp mill. Five additional stamps will be running in a few days and a new pan will be plaeed in the mill for saving the gold. The Eureka mine has a shaft 135 ft. deep, and a fine ledge of rich rock. Other mines in the vicinity are looking well. A new mine called the Champion is said to be very rich.

NEVADA COUNTY.

NORTH STAR.—*Gazette*, May 12th: Mr. Crossman, Supt., yesterday announced to the day-shift men that he must discharge all those who belonged to the League, as he could not comply with their demands. All left. Probably one-half of them, but for the pressure, would have preferred to remain.

EMPIRE.—At five o'clock Monday afternoon, Capt. Lee called the roll of workmen, informed them that those who had joined the League were not wanted, and directed them to go to the office and get the halance due them. The entire underground force were found to be members, and were discharged. Operations have ceased, except that the pump is running to keep the drifts frec of water, and Capt. Lee informs us that he will not resume operations until he can work the mine to suit himself.

THE LOSS.—The Empire and North Star mines, which have closed down, have heen producing about $70,000 a month; the loss to the circulation of Grass Valley can not be less than $50,000 a month.

ALLISON RANCH.—Same of 10th: The water in the Allisou Ranch mine has been lowered about 240 feet since they commenced pumping. A great obstacle to rapidly freeing the mine of water is the time consumed in lowering the pumps; it requires fourteen hours' lowering in the day to ten hours' pumping.

SEBASTOPOL.—This mill is crushing 150 tons of rock from the Gregory, Mansau & Co's ledge, on Osborne Hill. The last crushing yielded $89.50 per tou.

SUSTAINED.—Same of 14th: Capt. Lee and Mr. Crossman have each received telegrams from the owners, approving their conrse and telling them to hold firm.

ILLINOIS AND WISCONSIN MINE.—Two hnndred tons of rock from this mine will be crushed at the Sebastopol mill.

BEN FRANKLIN MINE.—15th: Forty-three loads of rock from south side of Osborne Hill, Grass Valley, crushed at Ben McCauley's mill last week, yielded 55 ozs. of gold, worth $16.25 an ounce.

NORTH BLOOMFIELN.—The Gravel Mining Co. are now running their ditch full of water, 2,000 inches. They use 11 pipes and employ 40 men in their claims. They intend to extend their ditch this season up to Big Cañon Creek, at Bowman's Ranch.

NORTH STAR.—17th: At this mine, all work, except pumping, has been suspended. The number of men that have left, or have beeu discharged, is 135. The company have 200 tons of rock on hand that will yield from $35 to $40 a tou. The lowest level in the mine is now down 1,040 feet on the incline, and 362 feet perpeudicular. They havo 1,000 cords of wood in their sheds, and had just procured a 16-inch pump. The valne of the mill, machinery, and property above ground, now lying idle, is estmated at from $150,000 to $200,000.

MINING AT EUREKA.—*Transcript*, 12th: A gentleman from Eureka informs us that all tho miners in that vicinity are constantly employed, and there is a fine prospect for the miners this season.

THE LEAGUE.—15th: On Tuesday the Empire cleaned up and shut down, and the North Star cleaned up yesterday. These two mines employed over 400 men, and others received wages indirectly. The stoppage of wages of so many has a very depressing effect on business. The end is not yet, for it is not known how soon other mines will be obliged to close their works. There however appears to be a general opiniou in the community that the trouble will soon be over.

MINING AT THE CASCADES.—16th: All the companies in the vicinity of the Cascades, on Deer Creek, are doing first rate. We were shown some fine specimens of coarse gold from the Spring Slide, a claim on the Washington ridge above the Cascades. Everywhere in that locality that the grounu has been prospected, the yield is encouraging.

WM. PENN MINE.—Grass Valley *Union*, 18th: The rock in the Penu mine is beginning to look fine again. The miners say the indications are splendid. On the hanging wall the quartz has considerahle gold visible to the naked eye.

OSBORNE HILL.—At Macauley's mill there is another crushing from Gregory & Mansau's mine going forward. The last was $89 a ton.

HOPE COMPANY.—At the Hope Gravel Co's works the large pump has been put in, and commenced to free the shaft of water yesterday. They have some 60 feet to sink before they can strike the pay gravel. The grounu is now easily worked, the hard cement having been gone through.

CHALK BLUFF.—*National*, 12th: We saw to-day at the bank of Findley & Co., a lump of gold weighing 39 ounces, and worth over $754, which came from Timmen's diggings. They are running about 2,000 feet of sluice boxes, but the gold of which we speak was cleaned up out of only thirteen boxes after a run of ten days.

PLUMAS COUNTY.

INDIAN VALLEY.—*Quincy National*. May 1st: The Crescent is now working some very rich rock, the gold heiug visible to the naked eye, disseminated all through it. The only question is whether it is exteusive or not.

THE BON ACCORN,—"Cahalin's Ledge," in the mountain west of the Crescent, is demonstrated to be extensive, being opened by tunnels to the depth of 300 or 400 feet and several hundred feet lengthwise on the ledge. It is the intention of the owners to erect works for crushing during the summer.

THE KITTLE, Judkins & Kellogg's mine at Cherokee, is paying extraordinarily well. In addition to their own mill, the Company have leased the Caledonia, both heing supplied with rock from the Kittle.

THE INDIAN VALLEY MINE.—The Company work about forty men and have two ledges, one recently discovered, both of which prospect well. They intend starting the Pensylvania mill in a few days.

ENTERPRISE.—This mine, in Lights' Cañon, is to be worked on an exteusive scale.

The Cosmopolitan copper mino at Genesee, is now turning out puro copper by the ton. They have already on hand about six or eight tons, and expect to havo twenty by the time the wagon road is opeu so that teams can freight for below. The placer mines also in that vicinity and Grizzly Creek are doing well.

SIERRA COUNTY.

ORIENTAL.—Downieville *Messenger*, May 15th: We understand that this Co., at Wet Ravine, near Alleghany, have struck a rich chimuey in their ledge, snpposed to be the same that paid so well in the workings above.

PROSPECTS WELL.—Frank Hauher of Alleghany, has discovered a quartz ledge near that place that prospects well. He is proceeding to develop it, going in on the ledge.

QUARTZ MILL.—Kime & Davis are putting up the Oak Flat Quartz Mill, and expect to have it in ruuning order before many months. The ledge is owuod by Steveus & Co.

SISKIYOU COUNTY.

ORO FINO.—Yreka *Union*, May 15th: The mines promise a big yield this season. Young & Eastlick are piping away day and night, with every prospect of a big yield. Wright Brothers will take out an immense sum this season. The Mugginsville or Quartz Valley mines, are yielding good returns. Shaw & Co. have just finished their new ditch, and have got to work with good prospects.

J. M. Trimble & Co's new Quartz mill at Hull Gulch, near Oro Fino, is ruuning day and night. Those that are good judges inform us that tho ledge is large and easy of access.

Squire Steele's claims, on McAdams, have been pumped out and a number of hands put to work. These claims are rich. Carrol & Co., and Oak Grove Co's claims, are paying well. Harry Mathewson's gold Hardscrabble claim is also paying well.

TRINITY COUNTY.

Journal, May 15th: Paulsen, O'Neal & Co. are prospecting on the head of McKenzie gulch with enery. They have been running a tunnel to reach a large flat lying along the base of the West Weaver hills. The hills and channels around Weaverville are going to he developed. There are entire flats and ravines where not a panfull of dirt has yet been disturbed.

ARIZONA.

STERLING.—Prescott *Miner*, April 24th: This mine is getting richer every day. At present, some 30 man aro employed in and about it. · Its average thinkness is about 14 feet, and the quartz of every strata in the mine is thickly spangled with gold and sulphurets.

GENUNG & SMITH have commenced work on the Montgomery. They are going to build four arastras.

NEW placer diggings have been discovered on the Hassayampa, nearly opposite Antelope Hill. They are said to he rich and of great extent.

JACKSON & Co's hydraulic claims are paying better than ever before. We saw, Saturday evening last, $1,400 worth of dust that had been brought over. The dust is worth, at the mint, $18.27 per onnce.

A party which took a trip through Walker and Hassayampa districts recently, report the finding of a large, rich lode, at Walker's, by Mr. Graves, which he named the "Geueral Grant." The new shaft on the Tie-Tie, was down 30 feet, and the rock shows plenty of free gold.

RICH ROCK.—A piece of rock weighing five and a half pounds, from the Independence lode, Big Bug district, was pounded up and panned out in our presence the other day, at the store of Gray & Co., and yielded six dollars.

COLORADO.

WILEY.—Georgetown *Miner*, May 6th: Watson & Edwards are working on this lode. The crevice is 15 ft. wide, and shows a large amount of pay rock. There are 4 shafts, each 30 ft. deep. Some large assays from selected ores have been obtained.

MARSHALL TUNNEL.—The workmen have reached a depth of 200 ft. The indications are that the Empire and Bulldog will soon be struck.

Dr. Hewitt has gone to work on the Cortez lode....Huepeden & Co. are running on a large lot of second class Equator ore, with good results.

EQUATOR.—The main shaft on the mine is down 206 ft. In the west end of the level the deposit of ore is truly astonishing. The mine is being run night and day. We saw at the mine ten tons of first class ore, worth in currency at Newark, New Jersey, say $800; 100 tons second-class ore that will net here in currency $150 per ton, and 2,000 tons of ore in the dump that will yield at least $70 per ton in currency, making a grand total of $143,000 worth of ore on hand. The profits of the mine have paid already the original purchase money, cost of running, building of roads, and left a handsome dividend. Improved steam works will soon be erected.

DOWNIEVILLE AND MONTANA DISTRICTS. Central City *Register*, April 22d:. On Friday, we visited some of the newly-discovered silver lodes. The Capital was the first. The discovery shaft is now down 50 ft., and shows a well-defined crevice 5 ft. betweeu walls, carrying a vein of rich-looking ore from 6 to 15 inches wide. In sinking this shaft 10 tons of first-class ore was taken out. Different assays of this have indicated a value of from $200 to $300 per ton. The Comstock, the next lode examined, is on Elephant Mountain, in Downieville district. The discovery shaft, we are informed, is about 30 ft. deep, and carries a vein of rich-looking ore nearly all the way....In the Comet, the crevice is exposed in several places for a distance of 400 or 500 ft., and shows all along an ore vein from two to three feet in width, nearly all of which looks exceedingly rich, and we are informed yields large results by assay....The National has a crevice three feet between walls, and carries a narrow streak of very rich ore.

IDAHO.

POORMAN.—Owyhee *Avalanche*, May 8th: Work is now progressing in the south drift of this mine. The ledge at this point varies from 18 inches to two feet in width, and the ore of excellent quality. The ore house is full, and they are piling up rock in the engine house. There are at least 300 tons on the ground. It is thought the road from the mine to the mill will be in condition for hauling next week.

BAXTER.—The shaft on this mine has been sunk as deep as tho Co. intend it for the present. They have drifted north 150 feet, and find a fine vein rich in gold and silver.

IDA ELMORE.—Silver City *Tidal Wave*, May 7th: This mine shows as well as ever. The north level is now in 80 feet from the shaft and they havn begun stoping on both sides, and will in a very short time take ont ore from the present working level. They are still sinking the main shaft for another level, and the ledge is larger and richer at the greatest depth reached thau at any point above.

SILVER CORD.—Thn main shaft is down 121 feet and will continue 80 feet further before starting a lnvel and commencing to stope. The ledge is from one to four feet wide. They have out about 20 tons of good milling ore.

GOLDEN CHARIOT.—The ore house, shute and yard are piled full of gold and silver-hearing ore tbat is unmistakably rich. Native gold can he seen in every ton of ore from the Chariot.

PLACER MINING.—The ditches leading ont nf Long Gulch in the direction of Ruby are all running full and every drop is being put to nse. Tbe claims beyond the lumber yard, north of Lineoln mill, are heing torn up with vigor. The season is 30 days ahead of any previous one, in the way nf good roads and placer mining.

CENTREVILLE.—Idaho City *World*, May 6th: The difficulty between Mr. Goldtrap and the miners in regard to the price of wator has been amicably settled, and all are at work in tbat vicinity. At Placerville, Granite Creek and More's Creek, and in fact tbroughout the basin, the ditches are generally full and the prospects are good for a prosperous mining season.

Very rich ore has been lately taken from the Elkhorn mine and the mill is again in operation.

Tidal Wave of 11th: The Owyhee mill started up on Wednesday.....The Ida Elmore mill is pounding away night and day ....The Silver Cord is now yielding richer ore than ever.

YUBA DISTRICT.—Boise City *Statesman*, May 4th: All the miners continue taking out ore as good as ever before. The trail is by this timn open for pack animals to Atlanta City. It was the intention to begin hauling ore yesterday to tbe Monarch Co's mill.

NEVADA.

ESMERALDA.

A correspondent of the Sacramento *Union*, writing from Anrora May 4th, says: About 300 pounds of silver hullion from Col. Catberwood's mill, in Palmetto, was brought in bere last week, and 400 pounds of fine gold bullion from S. B. Martin's mill in Silver Peak. The latter is estimated at $80,000. I am informed by the Collector of Int. Rev., for this county, that the annual list for the year 1868 exceeds that of the preceeding year by 57 per cent. and that the supplemental list will increase it to 63 per cent.

HUMBOLDT.

The *Registsr* of May 8th, says: Never since tbe palmy days of 1863 has such activity in mining affairs heen displayed in Humboldt as at the present time. Old mining districts, abandoned during the Indian outbreaks, and from a general lack of confidence in outside mining camps, incident to the period of 1865, are now again sought after by the prospector: new locations are heing made and old ones renewed. In Trinity district are several abandoned claims which are well wortby the attention of prospectors. The Evening Star mine, which has been partially developed, yielded from $75 to $400 per ton, and is said by good miners, who have examined the vein, to be rich and valuable, but tbe moment it became necessary to erect machinery, or to run a tunnel to drain it, work was suspended and the district deserted, and so it remains at the present time.

ECHO DISTRICT.—Judge Strong informs us that five companies are at work on tbe Alpba lead in Echo, two of which, one north and one soutb, havo tbe ledge in their shafts. He also says that a blast discbarged in the Alpha during tbe time he was at tbe mine displaced tons of ore, which was estimated by good judges at $300 per ton. The owners have refused $60,000 for a two-tbirds interest in the mine.

REESE RIVER.

TROJAN.—*Reveille* 8th: Mr. John Howell resumed work on this mine on Tuesday. The Trojan is on Lander Hill, in the vicinity of the Isabella and Revenue mines, and its former partial development was highly satisfactory. Work will heuceforward he carried on with energy. Tbe mine is furnisbed with a new and powerful hoisting apparatus.

MANHATTAN.—We saw this morning in tbe office of tbe Co. 46 silver bars, valued at $59,488 69. The production of the Manhattan siuce it resumed work on the 1st of April is remarkable. We reported the sbipment of some $60,000 for the steamer of the 30th ult., and to-day we found an equal amount ready for transmission to the Atlantic. The works are the most complete for the reduction of the local ores ever establisbed in this district. We learn that during the month the mill would nse only six furnaces instead of its full capacity of ten. The supply of ore is light and irregular at present, but before long this cause will cease to exist.

BULLION.—For tbe week ending Satnrday, the 8th instant, there were produced at the Manhattan mill 32,400 ounces of hullion.

TOTAL BULLION FOR THE QUARTER.—The returns of the Lander Co. Assessor for the qnarter ending March 31st, give 1,201 tons of nre reduced, the total value of which was $265,374—average $220.90—in gold. The *Reveille* says the retnrns are rough and of almost no value. They do not include the returns of the mills at Hamilton, but do include the rest of the White Pine yield.

WASHOE.

[In the Stock Circnlar, in another portion of this paper will he found late mining uews from this district.]

POSSIBLY A STRIKE.—*Enterprise*, May 11th: Yesterday a man employed upon a ditch back of Steamboat Springs, camo down to Reno with a chunk of rock to consult a friend; but not finding bis friend, showed tbe lnmp to some ontsiders. It was not long before he had an offer of $300 for tbe piece, wbich he refused. The story goes that he hired a horse, and when last seen was striking out in the direction of the Springs. The circumstance created some excitement in Reno.

FLOWERY.—Same of 12th: We were yesterday sbown some fine specimens of ore from the Flowery mine. One lump was nearly 100 pounds in weight, and was rich in sulphuret and cbloride. The assays run from $78 to $445 30. The mill is now shut down for repairs, but will sbortly start up with a large amonnt of ore ahead.

GOLD HILL.—There is nothing new to report in regard to the hurning mines in Gold Hill. Tbe fire is supposed to be out, and tbere was a rumor on the streets that they would he opened to-day.

NEW MEXICO.

MORENO MINES.—Santa Fe *Gazette*, May 1st: Work bas been commenced for the season at the Moreno mines with good prospects. The ditch will be completed by the 1st of June, until wbich time the mountain streams will furnish sufficient water.

OREGON.

The Roseburg *Ensign* says: "We are informed by a gentleman from Myrtle creek that new placer diggings have been discovered ou the north fork of Myrtle creek which, it is said, will pay from $10 to $15 per day to the hand. A large number of claims bave been located.

UTAH.

SMITHVILLE.—Salt Lake *Reporter*, May 4th: Mr. Blythe writes to Major Swect, of this city, as follows: "Mining operations are in a flourishing condition. Several hundred miners can obtain work here at the following rates: Day hands, $6 per day; night hands, $7, payable in clean Salmon River gold dust. Provisions are very high. I would advise miners coming to this camp to hring one month's provisions. By the middle of June everytbing will be plenty and at low prices; the trains will reacb bere by tbat time. Board at present is $12 per week in gold." Salmon River is about 350 miles from here, nearly straight north, and this is the natural outfitting point for persons from the East, West and South.

Several partics are outfitting for a trip to the newly-discovered mines near the Promontory, about 60 miles from here.

WYOMING.

CARISO HILL.—*Sweetwater Mines*, May 5tb: The rock in the Sheridan prospects well. Thn Wild Irishman is probably an extension. The Grecian Bend is yielding excellent ore, wbicb will be milled at first opportunity.. Every thing in tbe Hill looks well.

E. B. Eddy started up his quartz mill, half a mile below town, ou Monday last, on ore from Roberts' claim, Cariso ledge. On a run of 12 honrs in Mr. Eddy's little six-stamp mill, fifteen ounces were cleaned up from the plates alonc.

PRIDE OF DACOTAH.—J. W. Waters showed us a prospect from the crevice dirt it was very fine gold, the shaft is down about seven fect, and the ledge is two feet and nine inches in width. The ledge is on Cariso hill, a qnarter of a mile from town.

White Pine Summary.

As a caption for our White Pine Column this week, we may give two paragraphs. The first is from a private letter quoted by the Grass Valley *Union* of the 14th.—the other from the Virginia *Enterprise* of the 15th:

"My private opinion about the country is that it is, and will prove to he, the best country in America; hut it is uo place for a man sick in mind or body. Times are quiet now, and may remain so for a month, but there will be a reaction that will put all croakers to silence forever."

"The price of lots is going down. Men who refused $5,000 for lots a month ago, to-day could not get $250. There is evidently a relapse in White Pine, and everything is coming down to a proper level."

ITEMS OF MINING PROGRESS.—*News*, May 13th: Workmen are engaged on the Horner shaft now down 12 feet, at which depth a fine deposit of fair grade ore has been developed.....Indications in tbe Mazeppa (incorporated) are good. It is intended to sink 100 feet before breasting.....Five tons of ore from the Magenta has been milled, yielding $181 per ton....In the Silver Eagle, a short distance east of the Iceberg, a shaft is now down 25 feet, developing some encouraging prospects.... The Aurora Consolidated yesterday commenced the sbipment of 50 tons of ore, from the Last Chance shaft, to Staple's new mill below Shermantown, to be run through on the wet crushing plan.....About thirty-five claims on an average are being recorded daily by District Recorder Tenney and his deputies. Of lato the greatest numher come from the Base Range....Within the past few days we have seen many specimens of good ore from different ledges on the West Mountain, some of which show hut sligbt traces of hase metal and are extremely rich in chloride.....An ore house is being huilt over tbe Earl shaft. The ore recently struck is turning out so rich that almost every person passing carries off a specimen, aggregating in the course of a day a hundred pounds or more. The owners think this too expensive.

THE EBERHARDT.—*News*, 6th: This mine is as rich as ever. Teams are hauling ore to Shermantown, wbere the company has two mills, one of ten and the other of eight stamps. The average yield of the second class ore is $500 per ton. Tbe first class, whicb it is estimated will go several thousand dollars to the ton, is stored away in sacks, to be reduced by some other process. About a week since work was commenced in the original shaft. A number of sbafts along the Eberhardt have good ore, which proves beyond all doubt that tbis mine extends from 1,500 to 2,000 feet west from the company's ore house, and contains as rich and extensive bodies of ore as is fonnd in the 40-foot level, where the ledge is 183 feet wide, and rolls out its bullion by the thousands monthly. The Oasis mill produced, from Eberhardt ore, from October 14th, 1868, to April 28th, 1869, inclusive,—six months and fourteen days,—473 bars of bullion. Of these, but two dropped under .900 in fineness (they being .898 each), while the finest was .999—as near pure silver as can be imagined—the average being about .975, and the total amount reduced by ten stamps, $656,477.81.

THE INLAND EMPIRE ON THE EBERHARDT. "Its perpendicularly polished marble walls could not have been more symmetrically formed had they been the work of artists. The distance between these two walls, directly across, is precisely 183 feet. The vein matter between them is complete and perfect. Occasionally a slab of limestone intervenes, bnt it is thin in depth and narrow in extent. The whole deposit between the perpendicular walls may be said, with truth, to be one vast bed of silver ore, much of it so pure tbat a thousand pounds of it, fed to the battery of a mill, would simply beat down and close the screen as effectually as if so much lead were shoveled in. In traveling through the chambers of tbis mine, we stopped occasionally and pulled out, with our fingers, pure chloride ores which will yield by mill process from $1 to $3 to the pound. Amid these grim walls are vastly richer ores, worth, say in places, $12 to the pound. When we contemplate the fact that a shaft 184 feet in depth has been sunk, and ores of the same quality found that we have spoken of, the vast wealth of tbe Eberhardt can be imagined, but not described."

TUNNEL COMPANIES — ARGYLE.—*News*, 12tb: The location of tbis company's ground is at the base of Argyle Hill, a short distance south of the Eberhardt mine. The company is composed of San Francisco men. The tunnel is to be driven nigbt and day.

ANOTHER.—A location was made yesterday (on surface indications) for a tunnel to be run under Treasure Hill at a great depth. The company is to he incorporated under the name of the Boxwood Tunnel and Mining Company. The location was made by Daniel Hardy, about 1,400 feet below the Pocotillo, on the eastern side of the hill.

STRIKES.—*Empire*, 9tb: For some time past a number of miners have been engagod in prospecting some ledges ten miles from Hamilton, and a few days since they struck ore and brought it to town. We are informed that the ore gave an assay of $600 per ton.

News, 11th: We hear of a rich strike about 30 miles northeast of this city. Ore was exhibited on the street yesterday said to he worth $8,000 per ton, from the new district. We could hear no particulars.

MILLS.—*Empire*, 12th: Tbe new mill of the Treasure Co., in the lower part of Hamilton, will start up between the 20th and 25th inst. Ore is now heing delivered there. This is a first-class mill of twenty stamps; ten stamps will work hy the dry process and ten by the wet. The mill helonging to the Bank of California will be ready to start on the first day of June. Tbis is one mile and a half north of Hamilton, and has twenty-four stamps. Two other mills in the canon below Hamilton will be ready soon—one in June and tbn otber in July. The mill of Messrs. Dunn & McLean will start in a few days. Within the next 20 days tbere will not he less than 98 stamps in operation in this district.

WILL STEAM UP.—*News*, 12th: Staple's new mill, just below Shermantown, we understand, will steam up to-day, adding five more stamps to the milling capacity of the district.

NEWARK MILL.—Teams have been hauline ore from Chloride Flat to the Newark mill, distanco 22 miles, for tho past 10 days, and the mill will start up to-day on White Pine ore—the local mills not having capacity to meet the demands of our mines.

BORING MACHINE FOR PROSPECTING.—The *News*, of May 6th, says that La Patria mine, 1,000 feet west of the Eberhardt, has heen prospected with a horing apparatus to the depth of 50 feet. Tbe bole was 2⅛ inebes in diameter. The last two feet was rich in horn silver.

BULLION.—*Empire* 13th: To-day we saw two bars of bullion on the counter of the First National Bank in tbis city; No. 111 containing 1,176 50-100 onnces, 984 fine, and valued at $1,496 74; No. 112 containing 1,199 90-100 ounces, 985 fine, valued at $1,528 07. These hars are from the ores worked at the White Pine mill, A. L. Page, agent.

OUTSIDE DISTRICTS.—PATTERSON.—*Empire* 8th: Mr. O'Leary, of Treasnre City, sbowed us a certificate of tbe assay of some rock from the Great Eastern mine, which speaks marvelously well for that district. The rock assayed, according to S. L. Greely's test, $7,163 77 to the ton. We are informed that the ledge is 12 feet wide. The shaft bas only been sunk a few feet.

SACRAMENTO.—J. C. Young writes: The assays of our ore made at Hamilton average $256 per ton. Since my return we bave made a new strike about six miles soutb of this camp. The ore is pronounced hy Belmont men, several of whom are here, to be stetefeldtite. The gold-hearing ledges improve as we gain deptb, and pieces that show free gold are common.

CHINA—COAL.—A Chefoo letter dated April 13th, says Mr. Wortham who recently visited the Province of Shnutung found a Shanse merchant working coal mines in the Poshan valley, who if let aloue by the Mandarins, would be able to lay down Coals in Chefoo as low as $4 per ton. Large qnantities are being extracted for local consumption, from the Wei-bsien and Poshan valleys; but the squeezes are so ruinous, tbat a prohibition is thereby put upon its conveyanco to Chefoo. Tbe Imperial tax is however light, and the first cost of the coal is but 60 cash per 100 catties, at the pits' mouth.

BURNING AGAIN.—The Bellingham Bay Coal mines are burning again, and vessels are unable to land there.

FERTILIZED OVA TRANSPORTED IN ICE.—The fertilized ova of salmon sent from England to New Zealand under protection of ice are now living fish in the rivers. The only loss of eggs was in boxes not properly covered with ice. It is intended to stock all the waters of that country with salmon.

CALIFORNIA CAOUTCHOUC.—There is a caoutchouc tree in a thriving condition not far from San Juan South. The india-rubber tree has been generally considered a purely tropical production; but climatic conditions seem to be quite ignored in California.

San Francisco:
Saturday Morning, May 22, 1869.

The Miners' Strike in Grass Valley.

The chief mining feature of the past few days has been the strike at Grass Valley, where the miners have leagued together, to the nnmber of some 350, to resist the use of Giant Powder and single-hand drilling in the mines. They have had several meetings—some public, others secret—and "resolved" to do all in their power, "honorably, if possible, forcibly, if compelled, *not to allow* any of our fellow-citizens to use the murderous Giant [powder] in the county of Nevada." They have also "resolved" against the use of "single-handed drills." Now, as single-handed drills and Giant Powder will reduce the numher of men engaged in getting out hard rock one-half, it is suspected hy the mine owners that that is really "what's the matter," instead of detriment to health—the plea actually put forth. If such is not the case, why any need of reference whatever in the resolutions to "single-handed drills?" They oertainly do not affect the health.

The miners have evidently heen led into a false and untenable position by iojudicious leaders. So far as protection to health is concerned, it is a very proper subject to inquire into; hut the steps adopted are not at all likely to help the matter. So long as men can be found who are willing to use the Giant Powder, it is the right of the mine owners to employ them; and if full experience shall prove that its use is seriously detrimental to health, both owuers and the miners will very soon find it to their interest to discontinue it.

The local papers and citizens of Grass Valley, generally, are in sympathy with the mine owners. Two of the principal mines—the Empire and North Star—have closed work, and discharged some 350 men, and negotiations are pending with miners in othcr sections of the State for men who are not so teuder-skiuned on the powder qnestion. The excitement is great, and the interests of the entire community are more or less affected. The miners who oppose the use of the powder have an undoubted right to quit work; but the whole power of the State will he arrayed against them if they attempt to prevent others, as they say they will, from taking their places in the mines. It is to he hoped that hetter counsels will prevail, and the old hands, many of whom have families and homesteads iu Grass Valley, will consent to go to work again, and wait for a proper time and proper measures to abate the evil complained of—if, iodeed, any evil shall be found to actually exist.

Electricity Applied to Metallurgy.—The Partz Patent.

The working of ores of silver and other metals by the aid of electricity, was probably first proposed hy Prof. Bequerel, who devoted a numher of years to experimenting on the suhject, without attaining, however, any really practical resnlts, so far as concerned economy. According to his plan the ores were first subjected to roasting, in order to convert the metals to be extracted,—which were mostly in the state of sulphurets,—into chlorides and sulphates. These products were then dissolved, the former in a solution of chloride of sodium, and the latter in water, whereupon the liquids thus ohtained were respectively placed in vessels containing plates of copper, tinned iron or prepared carbon, which served as negative electrodes, and porous cups filled with a solutio n f chloride of sodium, and containing the positive metal, consisting of pieces of either zinc, iron or lead, were introduced to complete the voltaic combination. To establish the electric circuit the negative electrode of one apparatus was then, hy means of a wire or otherwise, brought in metallic contact with the positive electrode of the other, etc., and upon the last connection heing made, the reduction of the metals held in solution ensued. This process, which was especially intended for the heneficiating of silver ores, was finally abandoned hecause the percentage of metal ohtained from the ore was far less than that yielded by the Freiberg process of amalgamation, with which it also compared uufavorahly regarding expenses.

This whole suhject assnmed a new phaso when ahout ten years ago the first attempts were made in this country to apply the electric current directly to the ore without previous roasting. These attempts were prohahly suggested by the property possessed hy metallic sulphurets of conducting electricity. If in a solution of chloride of sodium sulphurets of silver are brought in contact with the positive electrode of a galvanic battery, they are decomposed, chloride of silver is formed and dissolved, and from it metallic silver is thrown down upou the negative electrode. This process is materially aided by the presence of chloride of copper produced either by the mutual dccomposition of sulphate of copper and chlorido of sodium, or hy the electrolytic action hetween a solution of chlo ride of sodium and a positive clectrode of copper.

It seems Mr. John Scott of San Francisco was the first who undertook a series of trials to test the practicability of suhjecting silver ores, plunged in a solution of chloride of sodium and salts of copper, to the action of voltaic electricity. Others, more or less conscious of their object and the scientific principles involved, stepped from time to time in his wake, failed, aud returned to their legitimate callings, until several months ago puhlic attention was anew and in a higher degree than ever before, drawn to the subject by an exhihition of experiments on an extensive scale hy Messrs. A. L. Nolf and F. L. A. Pioche. Their process, as publicly shown, is substantially as follows: They immerse the ore, finely pulverized, ina solutiou of chloride of sodium and sulphate of copper contained in a wooden vat, the inner sides of which are, to within six or eight inches from the hottom, lined with sheet copper. Iu the center of the vat is au upright shaft to which arms or stirrers are attached which are also covered with sheet copper, and extend downward far enough to he in contact with a layer of quicksilver resting ou the hottom. This quicksilver, and through it the arms or stirrers, are connected with the negative pole of a powerful galvanic battery, while the copper lining of the vat is connected with the positive pole. To allow the introduction of steam the vat is provided with a well-fitting cover. During the operation the shaft is revolved by power derived from a small steam engine, and thus the ore pulp is kept in agitation—so that the particles of sulphurets contained therein may successively be thrown in contact with the positive electrode, in order to become decomposed.

Now it must be borne in mind that in the application of electricity to the treatment of ores containing snlphurets and snch other metalliferous minerals as must he decomposed hefore their constitnent elements can combine to salts capable of forming electrolytes, from which metals may be reduced, it is a necessary condition for the success of the operation that each particle of such minerals be not only *brought* in contact with the positive electrode, but also *kept* in contact with the same, until it is decomposed.

This condition, it is evident, can not be complied with by a mere agitation of the ore pulp between electrodes placed vertically, or otherwise so arranged that a contact hetween each particle of sulphuret and the positive pole-plate is in great measure but a matter of chance, and generally of but momentary duration; unless the operation he continued for an indefinite length of time—or, indeed, the chemical ingredients added to the ore pulp he of such kind and quantity that the intended result would almost as well he reached without the application of electricity.

An invention by Dr. A. F. W. Partz, of Oakland, for which a U. S. patent has lately heen granted, is intended to meet the requirement ahove referred to, and thereby render practicable a new metallurgical process which may yet be destined to play a conspicuous part in our mining industry. The apparatus which he employs may briefly be described as follows:

A cylindrical wooden vessel, about 6 feet long and 4 feet in diameter, a segment of which, amounting to nearly one-third of its periphery, is missing, is horizontally so suspended on two gudgeons fastened to its sides in the line of its axis, that the opening left by the missing segment is on top. This opening is provided with lids which are closed dnring the operation. Lengthwise through one of the gudgeons is bored a hole, just wide enough to allow a steam pipe, which in the vessel is hent downward, to pass through it and remain in place when the gudgeon is turned. The bearings in which the gudgeons rest are supported by pieces of timber, hetween which thick plates of glass are inserted, to prevent loss of electricity by "leakage." The inner periphery of the vessel is, up to the hight of its axis, lined with a sheet of copper which forms the positive electrode, and is, by means of a wire which passes through the side of the vessel, brought in metallic connection with one of the gudgeons. Eight or ten inches from the periphery, below the axis of the vessel and parallel with the same, a numher of tuhes of brass or copper about two inches in diameter are placed in a segmental row a few inches from each other, resting at one end of the vessel upon a wooden, and at the other upon a metallic support. These tuhes constitute the negative electrode, and are, by means of a wire attached to the metallic support, and which passes through the tide of the vessel, brought in metallic connection with the other gudgeon. Upon either gudgeon rests the eud of a flat spring, and to these springs the respective pole wires of a galvanic battery, or some other generator of dynamic electricity, are fastened.

Having thus given an outline of the principal features of tho apparatus, we will proceed to give a brief description of the manner in which argeutiferous ores are worked by its means.

The cylindrical vessel is, to about one third of its capacity, filled with a solution of chloride of sodium, to which pulverized ore is added nntil the mass forms an easily flowing pulp. By power applied to a crank fastened vertically upon one of the gudgeons, the vessel is put in a slow swinging motion, the crank alternately deflecting from 40 to 50 degrees either way from its vertical position. This motion is intended to prevent the earthy portion of the ore from settling, and at the same time to facilitate the sinking of all heavier particles, (sulphurets etc.,) and their concentration upon the positive pole-plate, where they collect in a layer, which is kept agitated just enongh to insnre the constant forming of new points of contact with the pole-plate. The electric connection heing made as above stated, and steam heing turned on, a vigorous electrolytic action ensues. Water and chloride of sodium are decomposed, oxygen and chlorine are disengaged at the positive electrode, and ready to enter into the new combinations; they effect, under the influence of the electro-current, the decomposition of the sulphurets, and other metalliferous compounds resting upon the positive pole-plate, while they also attack the plate itself, forming with the material thereof, oxychloride of copper, which in turn aids in the formation of chloride of silver. The latter dissolves in the solution of chloride of sodium present, and from it metallic silver is reduced and deposited upon the tubes constituting the negative electrode. As the silver thus reduced is apt to be in a loose, flocculent or spongy state, the tubes must he amalgamated with mercury to hetter insure its adhesion and collection, and the amalgamation must from time to time be renewed, which may be accomplished by merely dropping some mercury into the vessel; hecause on coming in contact with the positive pole-plate the mercury is dissolved, whereupon it is reduced again to its metallic state, and deposited together with the silver. The form of tubes was chosen for the negative electrode, on account of the large surface which they afford, and the facility with which they are removed and stripped of the adhering amalgam. If under circumstances it should, however, he deemed preferahle to employ a layer of quieksilver in their stead, the same may be placed in a flat vessel, the negative pole-wire dipped into it, and the vessel suspended in the liquid. An addition of sulphate of copper to the ore pulp quickens the operation, but is not essential for its success. The positive pole-plate being dissolved in proportion nearly equivalent to the silver reduced (i. e. about 32: 108) must, from time to time, he restored. To this end the remaining portiou of the plate need not be removed, it heing necessary only to cover the spots where the metal has disappeared with patches of copper fastened to the vessel with copper nails.

The above described apparatus is also to be employed for the extraction of gold from auriferous pyrites; but if so employed, a positive electrode of iron or carbon (slabs of Bunsen coke or of graphite) is suhstituted for that of copper. The same change becomes necessary in the treatment of sulphurets and other ores of copper, in which also solid rods of copper in place of tubes are used as negative electrodes. According to the character of the ores, an alkaline sulphate or nitrate, or sulphate of iron, may sometimes advantageously be suhstituted for chloride of sodium, or used in counection therewith.

For reasons of economy, the employment of galvanic batteries is admissable only in the working of orcs of silver; for other ores, magneto-electro machines must he used in their stead, so that in generating the electric forces required, carbon may be consumed in place of zinc.

Dr. Partz expects soon to have his invention demonstrated on a full working scale. His patent is probably the first ever issued in this country for a purely electro-metallurgical process, and as the whole matter is comparatively new, and of no small importance, giving promise of many controversies and scientific elucidations, we have heen as full and explicit on the subject as our space and the material at our command would permit.

Woodside's Axle-Box Rubber Packing.

A very useful, and what strikes one at first glance as self-evidently a successful invention—provided no disadvantages that are yet undeveloped shall prove to be connected with it—has been brought into use in San Francisco, and patented through this office, by Mr. E. G. Woodside, the application of which is nearly as general as the employment of wagons and carriages themselves. It is nothing more than a ring, or cylindrical piece of rubber, packed into the inside of the hub of a wheel, and again covered and protected by the usual iron hub lining, or box, the effect of which is to deaden all sharp concussion to the axle, the framing, and the working gear of the wagon or carriage, including the pulling gear, the harness, and the horses. An ordinary wagon spring—an in dispensable invention certainly—does the same thing for the load; but disregards application of the assuaging principle of elasticity to the bones of the horses and vehicle. When a stone, or other obstruction, is encountered, the buggy for example furnished with Woodside's rubber, jolts more mildly, and with a deadened sound; while in a heavy dray the same effect is observable, but at the same time the exertion is said to be rendered perceptibly easier to the horses.

This rubber can be put into any ordinary wheels, of a wagon, or carriage, in a few hours, and without scratching the paint even—by simply knocking out the box and inserting this underneath it in the hub. Carriage makers in this city are trying Woodside's invention, the opinion generally expressed being very favorable; and Mr. Morton, the proprietor of 120 trucks and of the colossal city freighting concern on Ellis street, is undertaking a test of its merits for heavy vehicles. The following are the advantages claimed for it by the patent holders:

1. The carriage lasts twice as long.
2. The riding is easier.
3. Three horses, in a truck so cushioned, will draw as much as four without the rubber springs; the operation in practice being that when an obstacle is struck the rubber gives, and allows the vehicle or axle in motion to go on until the wheel, by the reaction of the rubber instantaneously propelled forward, can pass on to the obstacle, so preventing all concussion adverse to the motion from retarding the vehicle.
4. It is claimed that an additional weight placed on the wagon, will not increase proportionately the amount of traction, but will assist by inertia in carrying the wagon over the obstacle; the weight of the load bringing out the action of the rubber—to a certain limit, of course, where the rubber might be overpowered, depending upon its hardness, and design.
5. There is less liability to breaking of axles, wheels, harness, etc.
6. It is claimed as a matter of fact, that a carriage is not so likely to be upset in turning rapidly a short curve. The reason assigned for this is, that while the upper wheels cling only naturally to the ground, the lower ones are buoyant from pressure on the rubber, the tendency being to cause that side to rebound the more, in any direction that it can, and so recover itself.

Dr. A. F. Cooper, of 815 Market street, San Francisco, is one of the parties interested in this patent, to whom we would refer all parties regarding the subject.

New View of Treasure Hill.—Britton & Rey have lithographed a very correct drawing of Treasure Hill, made by Mr. S. C. Lewis, which shows less of the country than Mr. Peet's picture published by Bancroft & Co., but reproduces exactly the impression given to one by the mountains of Eastern Nevada. Mr. Peet's picture was intentionally foreshortened somewhat, with a view to getting in as much geography as possible. In this, the topography is more rounded, and the hights, ravines, trees, etc., possessing all the appearances of prosaic reality.

The Iron-Making Problem.

We regret to learn that the Oswego (Oregon) Iron Works have suspended operations. Cessation, however, of iron production on this coast, under existing circumstances of railroad building and prospective manufacturing, can surely be nothing more than temporary. If the Oregon Iron Works property is to depreciate in permanent value, it will be because other equally valuable deposits of ore more favorably situated, shall be found,—a supposition scarcely possible. This is probably a matter of "market." The demand for iron on this coast is met, or controlled, by a few; a state of affairs necessarily circumscribing to native iron production, but not to last long, under our rapid strides of progress in all of the producing arts and trades.

The Sacramento *Union* calculates: that the transportation of the iron of the Union and Central Pacific roads—at 100 tons per mile and 1776 miles from Omaha—cost them just about as much as its prime cost at St. Louis ($64, gold, per ton), when, if they had been furnished with rails from manufactories, say at Salt Lake, or Laramie Plains, it would have cost but one-third as much. The prime cost of the iron for the whole road delivered at St. Louis was about $11,000,000. Add to this $11,000,000 for transportation, and we have the real cost to the company. Deduct two-thirds of the transportation cost—$7,333,333 50—and we have $14,666,666, what the real cost would have been had the company's rails been supplied at Laramie Plains or Salt Lake. In twenty years the *Union* estimates that the gold and silver producing West will lay 20,000 miles of new rail; and if our iron ores could be worked up as cheaply as is done at Carondelet or Pittsburg, that the saving to us, in the construction of our great railway system alone, would amount to a hundred million dollars in gold.

But we shall also have an iron consuming world, where railroad and manufacturing machinery and the iron arts in general are already appreciated, in Japan and China. It is a question of economy, indeed, whether they may not, in the end, supply us, rather than we supply them. Good cooking coal, charcoal, economy of labor, and convenience to shipping, are the questions to be asked in determining the value of an iron ore deposit.

Obituary.—Miss Annie W. McClelland, a young lady of rare traits of character, of energy, artistic refinement, and the highest degree of womanly delicacy, who possessed at the same time a moral courage and perfect independence such as are popularly believed to be beyond the sphere of the dependent sex, died, after a brief illness, on Monday last, at St. Helena, Napa county, whither she had repaired for the benefit of the delightful climate of that region. Miss McClelland's initials were familiar to the readers of the Mining and Scientific Press, some of the best engravings that ever appeared in these pages having come from her hand. She was fond, indeed too fond, of the artistic work in which she excelled. All who have met or known Miss McClelland will learn of her demise with profoundest regret. It is one of those cases where we are compelled to ask ourselves the question, Why must it have been? for it seems that the noblest and best, whose qualities call forth a unanimous tribute of human regard, and even persons of entire immunity from all physical sources of disease, must occasionally be taken from the arena of life by a higher Cause or method of law than we find ourselves able to comprehend. The deceased was buried at St. Helena on Wednesday. She was formerly a resident of Cleveland, Ohio.

The Chilean Agricultural and Mechanical Exposition was to have opened at Santiago about the middle of May.

A communication containing valuable information from Virginia City, will be found on the second page.

White Pine.—We have some mining notes from our agent at White Pine, which came to hand too late for insertion to-day. They will appear next week.

African Exploration.—Du Chaillu, the African explorer, is expected in San Francisco shortly, on a visiting and lecturing tour.

Continental Life Insurance Company, 203 Montgomery street, corner of Pine.

Returned.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. Howland.

PAIN KILLER cures Sore Throat.
A Favorite Medicine with all classes, is Davis' Pain Killer.
If you have Painter's Colic, Use the Pain Killer.
NO Medicine is so popular As the Pain Killer.
KEEP the Pain Killer always on hand.
If you have a Cough or Cold, Use the Pain Killer.
LOOK out and not be caught without a Bottle of Pain Killer in the house.
LET every body use the Pain Killer For Sprains and Bruises.
EVERY sailor should carry a bottle of Pain Killer with him.
REMEMBER, the Pain Killer is for both Internal and External use.
The Pain Killer is sold by all Druggists and dealers in Family Medicines.
REDINGTON & CO., and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents. my1m

Dr. Hall has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs. Curling, Druit, Leo, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Boeck, Sperino, and Dewilz. Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to newcomers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco. 21v18-3m

CALIFORNIA AVENUE
Homestead Association.

Lots from 26 to 30 Feet Frontage by 120 Feet in Depth, in Blocks 88, 89, 90 and 91. Fronting on California street, between Seventeenth and Twenty-first Avenue.

Shares, $330 Gold Coin,
Payable in Monthly Installments of $10, without Interest—First Payment, $20.

This Association is organized to purchase a tract of land comprised in the above mentioned blocks. The location of this property being on THE LINE OF ONE OF THE MAIN AVENUES leading westerly from the business center of the city, and now easily accessible, makes it unsurpassed in present and prospective value by any property in the suburbs of the city. California avenue will at an early day be graded its entire length, and the railroad facilities which will be furnished during the next year will amply accommodate all shareholders who may desire to improve their lots.

There is NO DRIFT SAND on or near this property, and NO HIGH HILLS. The lots are large, and ALL DESIRABLE. TITLE PERFECT.

Its fine location, nearness to the business portions of the city, and the low price at which it is offered, combine to recommend this property to all who desire a profitable investment on easy terms.

Books of subscription open at the office of H. B. CONCDON, No. 619 Montgomery street. 21v18-2t

A NEW
Gold Metal.

THE GOLD METAL WATCHES
Now being introduced by
C. E. COLLINS & CO.,
No. 629 Washington street,
SAN FRANCISCO,
Surpass anything yet made in the way of an imitation Gold Watch. They wear well, and keep good time.

The Ladies' Watches cost $8 and $10 each.
The Gentlemen's cost $15 and $20 each.
Chains, from $3 to $6 each.

RECOMMENDATIONS:

San Francisco, May 12, 1869.
This to certify, that I have carried one of the small size Gold Metal Watches which I got of C. E. Collins & Co., and I find that it runs as well, and keeps as good time, as any Watch I ever carried, and I can therefore recommend them. I am engaged on the Sacramento steamer "Chrysopolis." C. A. COLBY.

I am an engineer on the San Jose Railroad. I have been carrying one of C. E. Collins & Co's Watches for about one year, and I can safely say it is the *very best* watch for time that I have ever seen. GEO. CORNWALL,
Engineer on the San Jose Railroad.

Messrs. C. E. Collins & Co:—Having heard your watches spoken of in the highest manner, I have resolved to order one for myself. You may send me one of the Lady's $10 Watches, without the chain. Send it as soon as possible, as I am very much in need of a time-piece.
R. B. PATTEN,
Toano, C. P. R. R.

The Public are cautioned against buying their watches at high prices, as many of them are sold for genuine *Gold Watches*, at from $100 to $150 each.
For List of Prices and Description of Goods send directly to us. Can be sent by Express, to be paid for on delivery.
C. E. COLLINS & CO.,
No 629 Washington street, San Francisco.
P. S.—Where six Watches of the above are ordered at one time, we will send one extra, free of all charge.
We also deal in the finest Gold and Silver Watches, Watch Materials, etc. Send for circulars or prices.

Important to Assayers.
Crucibles.
The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.
THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:
United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co, Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. Branch Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. Br. Mint.
Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.
Messrs. A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.
Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adie, Gantier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.
On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,
18v18-9p 519 Front street, San Francisco

Resources & Developments

The Beet Sugar Interest.

The production of sugar from beets, in California, is just now attracting a large share of public attention, and most deservedly so. It will require over 25,000 tons of raw sugar to supply this market the coming year, which will draw from our State not less than five millions of dollars, mostly in coin or bullion. With this fact in view, it is a matter of no little congratulation that a thorough and persistent attempt is about to be made in Sacramento to introduce there the culture of the sugar beet, and the manufacture of sugar therefrom. The Sacramento Beet Sugar Association has purchased about 350 acres of land, where they are now engaged in planting the seed for their first crop; and they have furthermore contracted with numerous other parties to plant with beets, some five, some ten and some twenty acres of land, the product of which is to be delivered to the company at five dollars per ton, and opportunities for contracts are still open. The best of seed, procured in Europe by the company's agent, Mr. W. Wadsworth, has already arrived, and has been distributed, and much of it already placed in the ground. Mr. Wadsworth is still abroad, studying the most improved systems and machinery for this manufacture, preparatory to undertaking the management of the company's factory in Sacramento. The factory building will be up and ready for the machinery by the time it arrives, and everything will be in operation early in the fall.

If this experiment succeeds according to anticipations, there is much reason to believe that beet sugar-making will become one of the leading industries of the State, and give employment to many thousands of people. The experiment is a bold one, and whether successful or not, the projectors will be entitled to the thanks of the entire State for the effort which they will have made to establish a new and important industry in California. At present they are sanguine of success, but will not grumble at failure.

We are justified in pronouncing the experiment a bold one, from the fact that with all that has been said upon the subject within the last twelve or fifteen years, there is, as yet, only one establishment for its manufacture in the country—at Chatsworth, Livingston County, Illinois. This establishment has been struggling along some five years, and it is only recently, we believe, they have succeeded in getting into fair and profitable operation. The trouble encountered was in the manufacture and not in the production of the raw material. Skill, only, was wanting. It is to be hoped that our Sacramento friends will start right. In Germany, there are nearly 300 factories, which use up over 400,000 tons of beets annually. Austria has about 150 factories; while France exceeds all other countries in the production of this important article of commerce.

The present high price of sugar, growing out of the disturbed condition of Cuba, will be a great help towards giving the enterprise a start in this State. The annual consumption of sugar in the United States is about 500,000 tons, not more than 35,000 to 40,000 tons of which are of home production. This is exclusive of the annual production of about 25,000 tons of maple sugar. There is a strong argument here for a strenuous and determined effort toward the introduction of this enterprise into California, where there is reason to believe the soil and climate are more favorable to beet sugar culture than in any other part of the world.

SHERMAN ISLAND IMPROVEMENTS.—Great success has attended the efforts of reclamation at Sherman Island, in the Sacramento river, near its junction with the San Joaquin. Extensive and continuous improvements have been made there. Forty-seven miles of embankment have been made, and four large dams have been constructed across as many sloughs. Thirty large open flumes, with swinging and stationary gates, have been located at different points for drainage or irrigation, if needed. Land on this island that a year or two ago was not worth more than $5 per acre, has recently sold as high as $30. The proprietors are holding out liberal inducements for capital and skill to locate there. They desire to

enter largely into the production of seeds, are contemplating the introduction of the sugar beet there, with a manufactory, and are also making arrangements to build or buy a little steamer for the trade between that island and this city. There are hundreds of places in this State where combination of effort and capital will succeed equally as well as at Sherman Island.

PROVEN A SUCCESS.—For several years past, and until recently, many persons in the interest of cattle raising have denominated the alluvial lands west of the San Joaquin and south of Stockton as a barren waste, "fit only for the grazing of sheep for three or four months in the year." Recently, however, attention has been attracted to these lands by grain-growers, and extensive tracts have been sown with wheat and barley the present season. The crops are now said to be in excellent condition, rich and thrifty in color, high as a man's shoulder, and giving every prospect of a bountiful harvest. This success will doubtless lead to a vastly increased improvement of lands in that vicinity in future years. The extent of these lands is immense, and that section presents a most inviting field for the emigrant.

PROFITABLE GRAPE GROWING.—It is said that every acre of vineyard in full bearing near St. Helena, Napa Valley, paid at least $75 net last season, and much of the land paid twice as much or more. The grapes in that section appear to be peculiarly adapted to distillation. About 40,000 gallons of brandy were made there last year, most of which was shipped to New York. This success has greatly stimulated the grape-growing business in that district, and fully 100,000 more choice varieties of vines will be set out there this season.

LUMBER TRADE.—The lumber trade of this city, for the quarter ending March 31st, amounted to over one and a quarter millions of dollars—at the rate of over $5,000,000 per annum. The most of this lumber now comes from Oregon and Washington Territory. The supply is inexhaustible.

WOOL IN SAN LUIS OBISPO.—Messrs. William and Robert Watt, of Grass Valley, have recently purchased a ranch of 27,000 acres, within fifteen miles of the town of San Luis Obispo, upon which they have already 11,000 sheep, which number they intend soon to increase to 20,000.

FULL PAID AND NOT LIABLE TO ASSESSMENT.

President.....A. DE LAND
Secretary.....LOUIS COHN
Superintendent at Mines.....CHAS. E. HARRIS

TRUSTEES:
A DE LAND, THOMAS ANSBRO,
CARL PRECHT, LOUIS COHN.
W. S. TAYLOR.

This Company offer to the public One Thousand Shares of the Capital Stock for a Working Capital, at the subscription price of Five Dollars per share—FULL PAID, and NEVER liable to any assessment whatever. The mine is admirably located for working, being situate on Argyle Hill, opposite Treasure City. Shaft sunk 10 feet, showing a large body of chloride, which assays $700 per ton, and which will now mill $200. The capital raised to be used and expended on the mine. The standing and reputation of the Trustees is ample guaranty of responsibility, etc. Maps and samples of ore, and subscriptions at the office of the Company, Rooms No. 15 Stevenson House, corner California and Montgomery, and at 211 and 213 California street, near Battery street. 16v18tf

ILLINOIS
SILVER MINING COMPANY
White Pine District.
Trustees:
JAS. H. CUTTER, B. F. FREEMAN,
E. H. SHAW, JAS. R. GARNISS,
DAVID BUSH.

The Company's Mine adjoins the celebrated "Silver Glance," and is in close proximity to the "Argyle," and other prominent mines of the District.

From developments already made, the Trustees feel justified in saying to their friends that this is one of the best opportunities ever offered for investment in this State.

For the purpose of further developing the mine, the Company has set aside a limited amount of stock, to be sold as a working capital, of which they now offer 1000 shares, at the nominal price of $2 50 per share, unassessable—the entire proceeds of which will be devoted to developing the mine.

The books of the Company are now open for subscription at the office of the Company, No. 432 Montgomery street, Room No. 1, first floor. By order.
JAS. U. CUTTER, President.
G. W. STEWART, Secretary.

Agricultural.

Farm Nuisances.

Tbe farmers of California bave bnt few of the farm nuisances to contend with which so greatly trouble the agriculturists of the Eastern States. Briars, thistles, and the whole pestiferous swarm of self-propagating farm weeds, occasion but little trouble on the lands east of the Rocky Mountains. Destructive insects, too, are as yet comparatively unknown here. The apple and the plum are as yet undefiled by tbe caterpillar and curculio, wbich work such havoc to fruit in tbe East.

Still, we may not always be thus preserved from sucb nuisances. To-day we may muncb our apples with a perfect freedom from care, lest we mingle an unsightly, crawling worm with tbe savory morsel; but we are now informed that

THE ORCHARD CATERPILLAR

bas found a lodgment in Oregon, even before the railroad, by which it was predicted he would take an early passage, had been completed. A correspondent writes to the Willamette *Farmer* as follows:

Tbousands of caterpillars are destroying our fruit trees at the present time. They are all over the country. Every man who bas an orchard should see to it, and destroy them. Cut off tbe nests and burn them. It is only a few years since this pest began its ravages. They are increasing on us, and a few years' negligence will make them so numerous, with their unsightly nests, that we shall feel like leaving the country."

The fruit growers of California should begin to watch their apple trees closely; and promptly exterminate these vermin as fast as they make their appearance. A good way to get rid of them is given by Mr. Aiken, in tbo *Horticulturist*, as follows: "Take a pole, sharpen the end, wind a rag around it, well saturated with whale oil or petroleum, and with it destroy the nest, and it will never be rebuilt."

THE RATTLE WEED,

The botanical name of which we are not acquainted with, makes its appearance on our plains early in the spring, and is so called, in popular parlance, from the fact that it hears a pod or shell, which, wben ripe, witb its seed makes a rattling noise when shaken. This weed grows from a single root, tbat sends fortb numerous branches, which in good soil reacb a hight of some three feet; but in poor ground not more than one foot. It mucb resembles the mosquito bean of New Mexico and the "plaius."

According to the Tuolumne *News*, tbis weed bas recently got a very had name; and if the popular surmise is true, California farmers would do well to look after it with a sharp stick. It appears that in very dry seasons, when grass is scarce, borses will eat of this weed, and become afflicted with a disease of the brain, which, if it gets well estahlished, appears to be incurable, and renders the animal forever after nseless. Although it was some time before sucb sickuess was traced to this food, there appears now to be uo doubt as to the fact. Many fine horses have heen ruined by it in the San Joaquin Valley. Late in the fall, when almost everything but the rattle weed is dried up or consumed, borses and colts will eat it readily. It is said to be spreading, especially in cultivated portions of the valley, and it is fcared that stubble fields will soon be rendered unfit as pasturage for borses. Farmers should look closely after this new danger, and uso all diligence to secure its extermination.

WILD OATS.

In all the wide range of accepted maxims there is none which should be more thoroughly guarded agaiust than the "sowing of wild oats;" and this is as true in the vegetable as in the moral kingdom. Wild oats are universally indigenous in California, where their presence has usually been considered rather a blessing than otherwise. In all otber parts of the world tbey are carefully watched for, and the utmost pains taken to eradicate their first appearance. Hitherto they bave usually heen confined to uncultivated lands; but of late they are finding their way into our wheat and barley fields, wbere they will soon work incalculable mischief, unless tbe utmost care is taken to weed them out and employ clean seed. A very few branches of wild oats is sufficient to seed a considerable breadth of ground; and the fact tbat they ripen and scatter tbeir seed before tbe other grain is harvested, must teach the farmer tbe excessive annoyance which their presence in grain fields must soon produce; If they are sown, no matter how, they *will* come up, with long, tough roots and luxuriant stalks and leaves, as sure as the sun shines. As the plant is an annual, when a field becomes infested witb it, the best way is to put it into pasture for a year, and tbus let tbe cattle kill out the seed. If care is not taken, tbe wild oats which California farmers are now thougbtlessly sowing in their broad fields, will ere long produce a crop which they may find quite as prolific in physical difficulties, as are the moral vagaries so often sown broadcast, by those just enteriug upon the great field of human existence.

Curiosities of Sugar.

Sugar is the sweet principle of food, and is found in both plants and animals. It exists largely in milk, and is generated in the animal liver; hut commerce obtains its supply of sugar exclusively from vegetahles. It is found in the juices or sap of nearly every variety of plant, at certain stages of their growth. The plant appropriates the sugar in its sap to the perfection of its seed. In the seed it takes the form of starch, from which latter substance the chemist can again change it back to sugar, as is hereinafter shown. The following is the proportion of sugar obtainable from various sources:

	per cent.		per cent.
Sugar Cane Juice	16	Cow's Milk	3.3
Beet Root	8	Rye Meal	3.2
Wheat Flour	6	Peas	2
Barley Meal	5.2	Indian Corn	1.5
Oat Meal	4.8	Rice	.3

Sugar may also be obtained from the carrot, parsnip, pumpkin, Irish and sweet potatoes, and from all sweet fruits. Sugar can even he made from saw dust and all kinds of ligneous fibers—"old rags" included. The very paper on which this paragrapb is printed may he converted into sugar.

There are five varieties of sugar, only two of which enter into commercial use,—cane sugar and grape sugar; but known to chemists as *sucrose* and *glucose*. The latter contains only two-fifths as much of the sweetening principle as the former, that is, five pounds of grape sugar will go no further than two pounds of cane sugar.

One of the most interesting curiosities with regard to sugar is the fact that common starch is almost identical witb grape sugar, and may be readily converted into a beautiful, sweet, white syrup, that is really an excellent article for table use; but not very readily crystallized into sugar. The composition of starch is, $C^{12} H^{10} O^{10}$; that of grape sugar, $C^{12} H^{12} O^{12}$, 2HO; tbe only difference between the two heing a small excess of water in the latter. The process of this cbange is so simple that any one can try it, as follows:

Mix one part of sulphuric acid with 100 parts of water. Dissolve your starch, in boiling water, to a thick creamy consistency; take 50 parts of the same and pour it slowly into the acidulated water already prepared, and you will have a viscid, gummy substance known as dextrine. Now to get rid of your sulphuric acid, add to tbe mass pulverized chalk, which will unite with the sulphur that forms the acid and fall to the bottom as sulphate of lime. Pour off the clear liquid, evaporate to a proper consistency, in the meantime occasionally throwing in a little more chalk, and drawing off as before, until the acid is all removed. When boiled down to a syrup, filter through powdered charcoal, made from bones, and you have your starch converted into a beautiful, clear, sweet syrup, a large portion of which can be crystallized into sugar. In the transformation there is nothing but water added to the starch; the sulphur and cbalk that was added to the mass being all removed. It is said tbat common potatoes treated in this way will yield 10 per cent. of their weight in sugar.

By the same process a large percentage of saw dust or any other ligneous fiber, paper, flax, linen, and even "old rags," may be converted into sugar, witb the only addition that these latter substances must be boiled a long time in the acidulated water, so as to first change tbe fibrous matter into starch.

You will have, however, from all these substances, *glucose*, or grape sugar, instead of *sucrose*, or cane sugar. The latter can be easily degraded to the former; but tbe puzzle is to reverse the process. Tbe chief use of grape sugar is for the manufacture of wine, hrandy, beer, etc.,—for which cane sugar will not answer. The great difficulty in tbe way of manufacturing syrup and sugar from starch is the fact tbat starch is generally worth as much as sugar—a very important consideration involved in the economical valuo of the process.

New Mining Advertisements.

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Mountain District, Alpiuo County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of May 1869, an assessment of one dollar and fifty cents ($1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, Pioneer Hall, (up stairs) Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-sixth day of June, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the fourteenth day of July, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. CROWNINSHIELD, Secretary.

Office, Pioneer Hall, Montgomery street, up stairs, San Francisco. my22

Mining Notices--Continued.

Bowden Silver Mining Company. Location of works: White Pine, White Pine County, Nevada.

And in accordance with law, and an order of the Board of Trustees, made on the twenty-sixth day of March, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., auctioneers, No. 327 Montgomery street, San Francisco, California, on the twenty-eighth day of May, 1869, at the hour of 11 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. B. WINGARD, Secretary.

Office, 408 California street, San Francisco. may7

Siempre Viva Silver Mining Company, District of Zarigossa, Sinaloa, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of April, 1869, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 318 California street.

Any stock upon which said assessment shall remain unpaid on the twenty-first day of May, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the seventh day of June, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.

Office, 318 California street, San Francisco. ap17

POSTPONEMENT.—The advertisement of stock delinquent on the above assessment is hereby postponed until Saturday, the twenty-ninth day of May, 1869, and the sale thereof until Monday, the fourteenth day of June, 1869. By order of the Board of Trustees.

my22 JOHN F. LOHSE, Secretary.

Troy Ledge Mining Company, White Pine District, Lander County, Nevada.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the sixteenth day of March, 1869, the several amounts set opposite the names of the respective shareholders as follows:

Pacific Protective Association of California.

INCORPORATED OCTOBER, 1868.

PROSPECTUS.

OBJECT.—The object of this Association is to secure a cash payment, within sixty days after the death of a subscriber, to his or her heirs or assigns, of as many dollars as there are individuals of the class to which said deceased subscriber belonged.

MEMBERSHIP.—The subscription fees are Ten Dollars at joining, and One Dollar on the death of each subscriber. The One Dollar from each subscriber is paid to the heirs or assigns of the deceased.

THE FUNDS.—The By-Laws of the Association require that a portion of the money received as subscription fees shall be a Sinking Fund to meet assessments falling due by the delinquencies of subscribers. The balance of the money received to be used for the payment of the expenses incurred by the Association.

MEMBERS.—A subscriber failing to pay his or her assessment of one dollar within Thirty days from receipt of notice forfeits his or her Certificate, and all claims upon the Association, unless good cause is shown for further delay. A subscriber can forward money in advance, which amount will be credited on future assessments. The subscribers are divided into classes including males and females Each class is limited to 5,000 subscribers. As classes are filled, new ones will be formed. No person is so poor that he cannot pay Ten Dollars at joining and One Dollar occasionally, thus securing $5,000 to his or her heirs or assigns.

ADVANTAGES.—The advantages of this Association are, that no *money panic* can affect it. Its benefits are easily obtainable by all, and every subscriber added to the Association enhances the interest and protection of all; the amount paid being so small, and only at long intervals, that any person can secure for his family a competency upon his death.

CLASSES.—In Class A, all persons between the ages of 15 and 40 years; in Class B, all persons between the ages of 40 and 60 years.

Any one that has not stated his or her age correctly, will forfeit all money paid and his or her Certificate.

One class cannot be assessed if one of another class dies. Classes have no connection with each other.

HOW TO BECOME A MEMBER.—A person desirous of becoming a subscriber must fill out an application, and forward with it Ten Dollars by Check, Draft, or by Express, in gold or silver coin. Persons can pay agents, when regularly appointed and authorized to receive money. Each subscriber should interest himself in obtaining new members, by so doing all are benefited.

BOARD OF DIRECTORS.—Benjamin H. Freeman, George H. Russell, Samuel A. Raymond, James A. Pritchard, W. LeRoy.

OFFICERS.—Benjamin H. Freeman, President; George H. Russell, Vice President; John H. Warren, Secretary; James A. Pritchard, Treasurer.

REFERENCES.—Hon. Henry Dutton, President of Farmers' and Mechanics' Bank; Hon. Samuel Cowles, late Judge County Court, San Francisco; Hon. A. J. Gunnison, Attorney at Law, San Francisco; H. J. Booth, Esq., Union Iron Works, San Francisco; Henry F. Williams, Esq., Real Estate, San Francisco; John O. Hanscom, Esq., Ætna Iron Works, San Francisco; John H. O'Brien, Esq., of O'Brien, Bush & Co., San Francisco; Hon. J. P Jones, Gold Hill, Nevada.

QUARTZ OPERATOR'S HAND-BOOK.

—BY—

WHEELER & RANDALL.

San Francisco, 1865.

A cheap and handy book for Quartz Prospectors, Millmen, and Amateur Assayers.

This little work, of 130 pages, although partly devoted to a discussion of limited interest to general readers, contains instructions in the WORKING AND ASSAYING OF ORES, AND TABLES FOR REFERENCE, which renders it quite desirable and of frequent service.

Price, $1, coin—$1 30 in currency or postage stamps. For sale by DEWEY & CO.,
Mining and Scientific Press, San Francisco.

MANUFACTURING
Room to Let.

We have a well lighted room, 22 by 36 feet, in second story at 414 Clay street, near Sansome, which we will rent very low, suitable for printing or manufacturing purposes.

DEWEY & CO.,
Publishers Mining and Scientific Press, 414 Clay st.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

ELLERY'S PATENT
India Rubber Cement and Paint
—FOR—

TIN, IRON AND METALLIC ROOFS,

Iron, Brick and Wooden Buildings,

SHIPS, STEAMBOATS, STAGES, CARS,

Blake's Patent.

THE BEST PUMP for Boiler Feeders, Breweries, Sugar Houses, Tanneries, Mining and Fire purposes, etc., is Blake's

Patent Steam PUMP

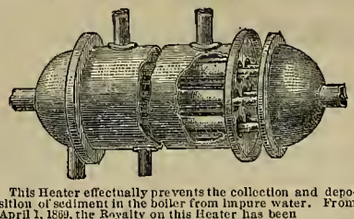
It is SIMPLE, COMPACT and POWERFUL, needs no expert to run it, and will start at any point. Is warranted POSITIVE under all circumstances. Send for a circular. W. O. M. BERRY & CO., 114 California St., San Francisco, Cal.

A NEW SLUICE
For Concentrating Gold, Amalgam, Sulphurets or Black Saud, in Quartz Mills,
OR PLACER MINES.

It is made without iron work, is cheap, durable, and effective; can be made by any good mining carpenter at the mine or mill, of sizes to separate the Sulphurets from one to fifty tons of saud per hour. There is no expense for motive power, or to handle the sand, if it can be run from the mine or mill directly into the receiving sizing boxes by means of water. It is continual, self-discharging, and can be used for concentrating fine gold and black sand, on the river bank or ocean beach. They may be seen at work in the American Company's Mine at North San Juan.

For information how to construct, and the cost, address
ORLANDO JENNINGS,
17v18 North San Juan, Cal.

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion, of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

WM. B. CROSS,
16v18-3m Patentee, Sacramento, Cal.

BLAKE'S PATENT
Steam Pumps.
W. O. M. Berry & Co., 114 California St., San Francisco.

Rock Drilling Machine.

Patent for Sale.

The Patent of George C. Phillips, issued Dec. 1, 1868, for a Steam or Compressed Air Rock Drilling Machine is now offered for sale on most reasonable terms. An illustration and full description of this Machine can be seen in the Mining and Scientific Press of March 27, 1869. Weight of Machine for ordinary tunnel work, 75 lbs. It is adjustable so as to drill in any direction; will make from 300 to 500 strokes per minute. One machine will do the work of twenty men

The inventor guarantees to satisfy any party who will interest themselves in the matter, of the entire practicability of his invention. Address, by express letter,

GEORGE C. PHILLIPS,
19v18-1m Shermantown, Nevada.

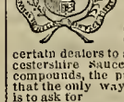
LEA & PERRINS'
CELEBRATED
WORCESTERSHIRE SAUCE



Declared by connoisseurs to be the only

GOOD SAUCE.

The success of this most delicious and unrivalled condiment having caused certain dealers to apply the name of "Worcestershire Sauce to their own inferior compounds, the public is hereby informed that the only way to secure the genuine, is to ask for

Lea & Perrins' Sauce,

and see that their names are upon the wrapper, label, stopper, and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against Manufacturers and Venders of such, or any other imitations by which their right may be infringed.

Caution against Fraud.

Ask for LEA & PERRINS' Sauce, and see name on the Wrapper, Label, Bottle, and Stopper.

Wholesale and for Export by the Proprietors, Worcester; Crosse & Blackwell, London, etc., etc.; and by Grocers and Oilmen universally. Agents, CROSS & CO. San Francisco. 3v18-6m

[Written for the Mining and Scientific Press.]

Virginia City Mining Topics.

EDITORS PRESS :—About Virginia there is more activity and prosperity than is generally supposed. Independently of the Comstock, there are several mines that afford considerable employment, and give evidences of future great value. Among these may be cited the Sierra Nevada, Senator, Cole, Julia, Flowery, and Occidental. The latter is not least, by any means, as it promises to be second hardly to the regular Comstock lode; yielding as it does from $20,000 to $30,000 of bullion monthly. The others have low grade ore with better in prospect.

The Cole, however, has quite a body of ore which assays high; but for some reason it is hard to work out.

Other outside lodes are being opened, with high hopes of their proving of value. The strike made some weeks ago in the lowest workings of the Hale & Norcross, has revived interest and confidence in the Comstock, which amounts to considerablo in making work along the line more active.

The Ophir and others are pushing tunnels and shafts to develop new riches, with vigor.

Taken altogether, the prosperity of Washoe for the present season is unmistakable.

At Gold Hill there is the same life, save the troubles occasioned by the late fires. The Empire-Imperial are cutting the lode, but not with the encouragement that they would like. The vein matter in these mines seems to be of good enough proportions, but it carries so little of pay ore as to be of no value, save to fallow. These companies have had a long run of prosperity, and it is nothing more than they should expect now to have a little run of bad luck. Such is mining. The companies are showing sufficient energy to entitle them to prosperity again.

The other mines are moving as usual, save Crown Point and Kentuck, which are bothered on acconnt of the fire.

On American Flat several leads are being opened. The American is producing large bodies of low grade ore, and promises to be a good mine.

Mills in and about Gold Hill are kept running, and to the general observer there is as much life as there was five years ago.

About Silver City there is renewed life. The prosperity attending the Twin mine, under tho management of Mr. Samuel Chapin, the main owner, has given quite an impetus to this section. The Twin has produced lately, some $10,000, monthly, though working on a somewhat limited scale. In one of the lower levels of this mine lately, a stratum of ore greatly resembling the Comstock, was struck, and which, by assay, runs over $100 per ton.

The question as to whether the Comstock does not continue down Gold Cañon, and begin to rise at about this juncture, has been one long mooted. From the Devil's Gate, or down to Johntown, at intervals on the liue, a number of mines are being opened, and which pay better even than what is now the average of Comstock ores, viz., from $15 to $150 per ton. The average of the Twin for the past month has been about $60 per ton.

The amount of ground embraced in this location more than equals that of Imperial, Empire, Yellow Jacket, Crown Point and Kentuck combined.

A shaft sunk on the old Emigrant produces ore so like the Comstock that one will pass for the other—the ore, however, is of poor quality. About Silver City there are more paying strata and prospective mines than even about Gold Hill and Virginia (outside of the Comstock), and during the comiug summer we would not be surprised to see a number of as prosperous mines developed as the Twin.

The Independence, between Gold Hill and Silver City, are pushing their work with vigor and with very fine prospects, in fact, recently, several small strata of good ore have been struck, giving high hopes of larger bodies near by.

* * *

MINING AND SCIENTIFIC PRESS.—This useful and scientific journal has entered upon its eighteenth volume.

To the scientific, mechanic, and practical men of all classes it is almost invaluable; and we are glad to learn that it is increasing in patronage every day.

The publishers, Dewey & Co., San Francisco, say the present volume shall be superior in all respects to its predecessors.

The terms are $5 in advance, $3 for six months.—*San Bernardino Guardian, March 6th.*

To Remove Acid Stains and Restore Color.—When color on a fabric has been accidentally or otherwise destroyed by acid, ammonia is applied to neutralize the same; a subsequent application of chloroform will, in almost all cases, restore the original color. The application of ammonia, as above, is common; that of chloroform is but little known. Chloroform will also remove paint from a garment or elsewhere, when oven ether, benzole or bi-sulphide of carbon fail.

Gold Ink may be made by grinding gold leaf to an impalpable paste with pure honey on a hard slab, with a muller; collect and dilute the paste in a glass vessel with water. The gold will settle in a bright powder, while the honey may be all dissolved out by repeated washings. To use as an ink, mix the powder with a little gum water, as wanted; write, and when dry, burnish with a piece of ivory. The effect is beautiful. Silver ink may be made in the same manner.

Essence of Coffee is sold in Cincinnati, made of dirty molasses, boiled down dry, cooled and pulverized, and mixed with a little finely pulverized burut ryo and coffee.

The Australian Gold Fields.—"An impression has got abroad in England that all the rich holes have been hit upon, and made to yield up their treasure. Every day's experience in the colony proves this notion to be utterly erroneous. Even in and about Ballarat, which early won the reputation of being the most magnificent El Dorado the world had yet known, there are 22 mining companies to be named that have returned to their shareholders dividends of 2,225,000*l.*, on a called-up capital of barely 890,000*l.*, and yet this sum has been obtained, over and above expenses, from only 250 acres, out of an area of 3000 acres held by them on lease or otherwise; 40,000,000*l.* sterling have been taken up from the ground now covered by the houses and streets of Ballarat; and there are indications unmistakable to the miner, now instructed by 15 or 16 years' experience, that the course of the river which once bore the gold in its waters has but to be followed, and deposits greater than any yet found will reward a scientific and persistent search."—*London Mining Journal.*

The Dighton Rock.—This rock, near Taunton, Mass., bears an inscription,—says the Taunton *Gazette*,—which has given rise to much speculation. Many antiquarians have studied it. "Mr. Harris, the learned orientalist, thought he found the Hebrew word *melek* (king) in the inscription. Col. Vallancy considered it of Scythian origin. The Rhode Island Historical Society caused a carefully prepared drawing of the rock to be sent to the Royal Society of Antiquaries of Copenhagen, by whom it was submitted to Professor Rafn, the eminent Runic scholar, and learned associate, Professor Finn Magnusson. A part of the inscription they declared to be in the Runic character, and to read: "On this spot landed Thornfenn with one hundred and thirty-one men." Various drawings have been made of the rock and its inscription, differing in essential particulars; but last summer a successful attempt was made to photograph the rock with a large plate, and the inscription may now be critically examined by the antiquarian."

The Tyranny of Labor.—Thirty years ago, the practice of hardening needles in oil instead of water, was revived in Birmingham. Needles hardened in water were generally made crooked in the process, and this circumstance gave employment to a considerable number of "straighteners." The oil-hardened needles were invariably straight, and thus a large selection of local craftsmen found, like Othello, their occupation gone. A determined volley of abuse was poured on the unfortunate reviver of this process. He was several times mobbed, and ultimately driven from the town."—*The Engineer.*

CALIFORNIA
BUSINESS UNIVERSITY,
204 Montgomery Street.

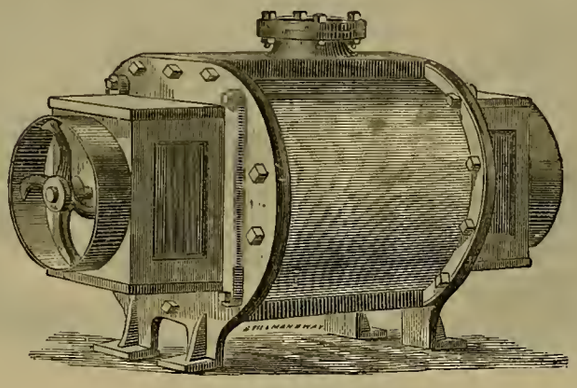
Full particulars regarding our Practical Course of Study may be had by calling at the University, or by addressing
17v17-qy12p E. P. HEALD, San Francisco.

By Mail.—The *Mining and Scientific Press* will be sent by mail to any part of the civilized world. In case of removal subscribers have only to inform us of the post office address of the old and new location, and the paper will be sent accordingly.

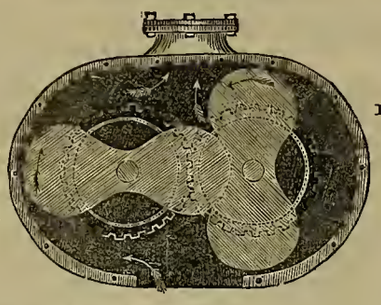
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.



ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address

KEEP & BARGION,

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skilful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

VOLUNTEER COMPLIMENTS.

SAN FRANCISCO, May 5, 1869.—MESSRS. DEWEY & CO. Gentlemen:—Allow me to express to you many thanks for services rendered me in procuring my patent, which has just come to hand. I would also say that your work has been faithfully done, and your advice and representations have in all cases been honest and truthful.
Respectfully, GEO. INWOOD.

SAN FRANCISCO, April 19, 1869.
MESSRS. DEWEY & CO., Patent Agents.—*Gentlemen:*—Allow me herewith to tender you my sincere thanks for the efficient assistance you have rendered me in securing my patent, and other papers, as well as the promptness and energy displayed by you in our business transactions. Very respectfully yours, C. E. JAYCOX.

NEVADA CITY, Nov. 3d, 1868.
MESSRS. DEWEY & CO.—Gentlemen:—Your favor of the 30th ult., is just received, informing me of the successfull prosecution of my application for a patent on my "Hair Cutting Shears." Please accept my sincere thanks for the speedy and successful manner in which you have conducted the case, and believe me, as ever,
Very truly yours, LEE D. CRAIG.

GRASS VALLEY, Dec. 2, 1868—*Messrs. Dewey & Co:*—Having received the patent for Symons & Co's Tossing and Refining Concentrator, through your Agency, we return our sincere thanks to you for your unrivalled success. Yours, respectfully, SYMONS & HARRY.

We have had frequent occasion to have business relations with the patent agency connected with this establishment, and have had nothing left to desire in regard to it. Fidelity, promptness and courtesy, soon arranged everything for us to our complete satisfaction. Having had frequent delays at Washington while in that city, we have been surprised at the promptitude with which some of our friends obtained their patents through the agency of Messrs. Dewey & Co.—*S. F. Spiritual Light.*

LEXINGTON, April 3, 1869.
DEAR SIRS:—The Letters Patent have just come to hand. For the prompt and business-like manner with which you have put the matter through, please accept my thanks. GEO. W. TEASDALE.
To DEWEY & CO., Publishers M. & S. Press.

STOCKTON, April 8th, 1869.
MESSRS. DEWEY & CO.:—Your favor of the 6th inst., accompanying patent for improvement in horse shoes, is received. I beg you will accept the earnest assurance of my gratitude for your kind assistance and valuable services. Very truly yours, W. R. WATSON.

THE MINING AND SCIENTIFIC PRESS is one of the most useful publications on the Pacific Coast.
Messrs. Dewey & Co., the publishers, are United States and foreign patent agents, and from their intimate connection with the Patent Office, are enabled to furnish their readers with all the latest patents and improvements pertaining to labor-saving machinery, etc. We bespeak for this excellent paper a lengthy subscription list in White Pine.—*White Pine News, April 23.*

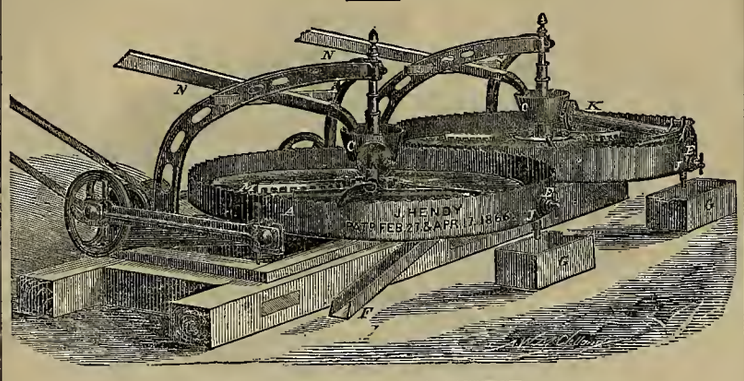
PORTLAND, Oregon, May 2, 1869.
MESSRS. DEWEY & CO.—*Gentlemen:*—Receive my kindest thanks for your attention in the matter of bringing my application for a Patent to a successful issue.
THOMAS MANN.

REASONS FOR SUCCESS.

We would especially call the attention of the inventive public to the fact that our Patent Agency is taking out a larger number of Patents than any other agency west of the Mississippi River. We do our work promptly and thoroughly, and refer to our standing amongst inventors as an evidence of our success in our special department. Our work is all done inside of our office, BY COMPETENT AND RELIABLE PERSONS, who have been for years interested and associated with us. We therefore are not compelled (like many agencies) to trust valuable and important inventions promiscuously to outsiders, to have part of the case prepared, but inventors can depend that, from the time their cases are first placed in our office, they are kept with proper secrecy until full rights are secured in the Patent Office in Washington. This is an important point in the proper prosecution of Patent business. It is a notorious fact that some prominent agencies trust a considerable portion of their cases to apprentices and amateurs. A deficiency or want of attention to the small affairs of any kind of business will often prove as harmful as a flagrant violation of the most important rules which govern and control it.

DEWEY & CO.,
Patent Solicitors, Mining and Scientific Press Office, 414 Clay street, below Sansome, San Francisco. MAY, 1869.

PREMIUM FOR BEST CONCENTRATOR
AWARDED BY THE
MECHANICS' INSTITUTE, 1868,
ALSO AT THE STATE FAIR FOR 1868,
To J. HENDY.



A LARGE NUMBER OF THESE
IMPROVED CONCENTRATORS
ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.
By recent alterations in the patterns for these machines, they are now made
Stronger and more Durable than Ever.

OFFICE OF NORTH STAR MINE, GRASS VALLEY, Nov. 12, 1868.
JOSHUA HENDY, ESQ.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.
Respectfully yours, J. H. CROSSMAN, Supt. N. S. Mine.

J. HENDY, Patentee.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.
The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.
Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.
Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.
Tuition, $125 per year of forty weeks.
The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.
For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

The Late Rains and the Crops.

There seems to be a diversity of opinion among the interior papers with regard to the general effect of the late rains on the incoming crops. No doubt damage was done in some quarters, while in others much benefit was derived. We incline to the opinion, that, on the whole, the rain has been an advantage; although such advantage would have been much more strongly marked had it fallen two weeks earlier. The fall was quite universal all over the Western Slope, from British Columbia to Northern Mexico.

The only damage, and that not serious, appears to have been confined to the central portion of this State. The most of the injury done was to grain and hay which had been cut. There was but little of the former down, and for every ton of the latter that was destroyed or seriously damaged, hundreds of tons of new and better grass has been put forward, that will go so much to increase the crop which will be cut the coming month.

The rain will bring money to the pockets of the mountain farmers, everywhere. Their hay was not ready for cutting, and their grain was in just the condition when a late rain would do it the most service.

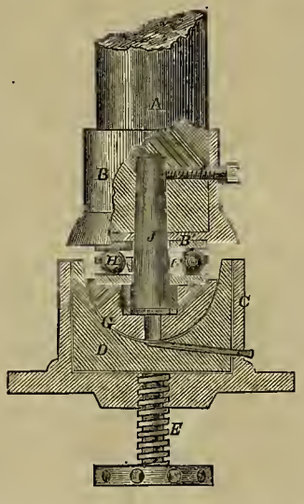
Reports reach us of serious damage to wheat from rust in the Salinas Valley, where in some places it is said the crops are entirely ruined, so much so that the fields will not be harvested. The local papers bring similar reports from the crops about Suscol, Napa and Sonoma; but the damage in these localities is not so general or so bad. It is also reported in several localities that worms are injuring the grains. Such reports should be received with a great deal of allowance, as they are too often circulated in the interest of speculators.

On the whole we may expect a grain crop, the present season, fully equal to, if not in excess of last year. The summer has been rather a dry one, and the grain, in consequence, not quite so full in its yield; but the increased breadth of land sown, will more than make up any deficiency which may occur from lack of moisture.

The vegetable and fruit crops are doing remarkably well, particularly the latter. Our market has been fairly glutted with strawberries, and we are just now in the hight of the cherry season. This fruit was never more abundant and tempting in this market, than it is now. The most of the cherries which reach this city are grown in Alameda County. Large shipments are also received from Santa Clara, Napa and Sonoma. Increased attention appears to be given to this delicious fruit; but there is no danger of the market becoming overstocked.

Improved Step for Vertical Shafts.

Heavy vertical shafts which frequently weigh as much as four tons and upwards, require a setting of a most substantial and durable character; and the adjustment in case of a slight sinking out of level of the foundation should be easy and not necessitate many days' delay for repairs at great expense. None of the shaft bearings now generally in use, come up to the proper requirements. The ordinary plan is to set the end of the shaft on a bed of iron disks placed in a socket; but these occasion much friction and heating, and are apt to clog with each other, the effect of which is precisely the same as if there were no disks at all.



Messrs. Bennett, Purinton and Siebert, of Nevada City, Cal., have devised and patented through Dewey & Co's Agency, (Dec. 1, 1868) the arrangement represented in the accompanying engraving, which applies to shaft bearings two novel principles, both of which are essential in accomplishing the operation of a non-heating and self-adjusting vertical shaft step. The end of the shaft rests and rolls on five or six steel balls H (of any size) which are kept in place by a disk, here indicated by I, having holes into which the balls fit loosely. The second principle is to secure self-adjustment in case that the shaft foundation should sink,—as it generally does—a little out of level. This is effected by means of a semi-globular casting, F G, which fits into the socket G. If the foundation, C D, should alter in its level, no parts affecting the revolution of the shaft are changed, the half globe sliding so far in D as to keep the friction plates F and B parallel, and in perfect adjustment by the motion of the shaft itself. The details will be rendered further comprehensible from the following references:

A is the shaft; B a cap inclosing the bottom, for the purpose of holding the hardened steel plate B'; J a spindle to prevent lateral motion; D a part of the foundation set movably into the stationary foundation C, in order that the entire shaft step, and shaft included, may be raised or lowered by the screw E, in case of any settling in the ground foundation. The guide I is so pierced for the balls that none of them run in the same track with each other, but vary about 1-16 of an inch. The balls and plates should be tempered alike, and as hard as possible.

This bearing has been tried in the Nevada Flouring Mills, carrying a shaft of 3,500 lbs, which has been running since the 1st of March last, showing no perceptible wear, keeping in perfect order, and giving full satisfaction, according to the certificate of Messrs. Torson & Clark, proprietors, who do not hesitate to say they believe it to be the best in use.

The cost of bearings for the above-named capacity is estimated in the neigborhood of from $75 to $100.

Messrs. Hinckley & Co., of the Fulton Foundry, are the agents in this city.

THE DISABLED MINES.—The shafts of the Kentuck and Crown Point mines, which were opened last week, as also the drift connecting them with the Yellow Jacket, gave the latter plenty of good air at the lower levels, but also sent clouds of hot and steamy vapor up through the Crown Point and Kentuck shafts. The Yellow Jacket is working about half its usual force, and the Kentuck is also sending out considerable ore; but nothing is being done with the Crown Point, on account of the bad air. Efforts are being made to conduct the bad air directly out from the mine. It is feared the fire is not yet fully extinguished, but there will be no more efforts to smother it; if anything more is to be done it will be to give the fire all the air it wants, and let it burn itself out. There are still three bodies not yet recovered.

EARTH MOVEMENT INDICATOR.—We are informed by Mr. F. A. Herring, that he designs the float in his earth-movement indicator to be of metal instead of wood, as the latter would expand unevenly in water, and so alter its center of gravity. The instrument should be at least 60 feet in length, the upright 30 feet in length. In a circle of 60 feet diameter a second of arc is only the 1.582 of an inch, or an inch in a circle 6¼ miles in diameter, an amount too small to be perceived and measured by the unassisted eye.

The Iron Moulders' Union and friends, went pic-nicking to Point San Quentin, Marin County, on Sunday last.

The Grass Valley Strike.

Matters in Grass Valley remain much as they were at the date of our last issue, especially so far as the strikers are concerned, who still hold out; while the superintendents, acting under instructions from the owners, positively refuse to work their mines under the dictation of the Miners' League. In the meantime the Empire mine has advertised for 100 single-handed drillers, and has had numerous applications, mostly Americans and Germans. The new men say they are not afraid of any kind of powder, or of powder burnt under any kind of circumstances—have smelt powder before. These works will probably be started up again in a day or two.

Quite a number of Canadian Frenchmen who have been accustomed to single-handed drilling, have applied for work at the Banner mine, in Nevada, and have found employment, in place of others who refused to work as their employers desired.

There has been considerable talk about employing Chinamen in the mines, at cheap rates; but we presume the employers will find plenty of white men who will be willing to work at old prices, with single-handed drills and Giant Powder. The policy of introducing Chinamen into underground work is a questionable one; and we presume no employers will adopt such a course, unless they are forced to it by the unreasonable demands of white miners.

As we said last week, the miners of Grass Valley have committed a great mistake, and their course will react upon themselves. They have unwittingly been the cause of most effectually advertising the benefits of Giant Powder and single-handed drilling; which will hereafter be very generally resorted to in localities where their advantages have not heretofore been known.

In conclusion, we heartily endorse the sentiment of the Nevada *Gazette*, which expresses none but the kindest feelings towards the miners who are engaged in this movement. "Miners compose a large and respectable class of our population. They are the bone and sinew of the State. They are industrious, hardy, and many of them highly intelligent. They are entitled to a respectful hearing at the bar of public opinion;" but they should not claim to dictate to their employers as to how the mines should be worked, or threaten violence in case their demands are not complied with. We trust a sober, second thought will prevail among them, and that they will again go quietly to work, to the end that peace and harmony may once more prevail between all concerned.

WELL KNOWN MINE FOR SALE.—The Golden Rule mine and works, located in Tuolumne County, California, is offered for sale, as fully explained in our advertising columns. The mine is being successfully worked, and regular dividends have been reported for the past two years in the regular San Francisco stock reports. The offer is worthy the consideration of capitalists.

[From Rowlandson's "Earthquake Dangers, Causes and Palliatives."—just published.]

Palliatives, Suggestions and Conclusions

Truth compels the admission that a portion of California, including the locality around San Francisco, is, at indefinite periods, subjected to the action of earthquakes. It fortunately so happens that the physical geography around this city is of such a character as to largely modify, if not wholly obviate, many of the dangers which are found sometimes to occur when earthquakes take place at or near the seaboard. Allusion is here more particularly made to ocean earthquake-waves and landslips. The first is not found generally destructive, excepting in the cases of harbors immediately open to the ocean or near the *debouchure* of bell-mouthed rivers or bays. Landlocked as the harbor of San Francisco is, even if an earthquake ocean-wave sixty feet in hight was to break on our outlying western shore, it could only penetrate into our harbor by the width of the narrow passage of the Golden Gate, which, as it rapidly expands after its entrance, to the north, south and east, within a short distance from the narrowest part, and would have to travel some miles before its effects could be felt at San Francisco, ere its arrival at which point its force would be much modified by the resistance it would have received, by the various rocks and islands which it would have to pass in the course of its progress.

The other danger that we are not likely to encounter to any ruinous extent, is that which might probably arise from landslips, notwithstanding the extension of the city front into the bay, from time to time, through the interested influence of speculating land-grabbers, with former legislatures; as much as possible, has been accomplished to bring about so undesirable events as landslips. Owing to the fact that our bay is comparatively a shallow one, we are not likely to witness a newly and solidly constructed wharf, as in the case of the earthquake at Lisbon, destroyed and replaced by deep water, in consequence of a landslip. Though partial fissuring amongst the unstable ground of our water lots may take place, and irregular shrinking and elevation of foundations so situated, may occur; sufficiently so as to be calculated seriously to damage massive and elevated brick or stone structures which may be erected on such *made* and generally unconsolidated ground, but a serious landslip need not be apprehended.

In fact, as is well known to its residents, the damage caused by earthquakes at San Francisco and around its bay, almost wholly took place on alluvial soil, or made ground, as at Lisbon, the South American cities, and many other places; the next greatest amount of damage having occurred where buildings had been erected on foundations most nearly allied in characteristics to those just noticed. Notwithstanding the explanations given and the opinion expressed by Mr. Mallet, I am inclined to believe that greater danger *does* exist to dwellings placed upon deep, alluvial soil than when erected upon a rocky foundation. Exceptional cases may occur, and doubtless have occurred, but such exceptions, I suspect, will go to prove the general correctness of the opinion which I have expressed.

With Mr. Mallet I believe that the greater danger to erections placed on alluvium arises from the amplitude of the wave being greater in such strata than when passing through solid rock. It is a noteworthy fact that although the great earthquake waves which accompanied the South American earthquakes of last year, and also the previous one at the Saodwich Islands, which accompanied the last great volcanic outbreak in that locality, were most distinctly indicated by the self-registering tide gauges at San Diego and Fort Point, while not the slightest oscillation was noted for the California earthquakes of Octobers, 1865 and 1868,—a pretty satisfactory indication, coupled with the fact that the shocks on those occasions were scarcely felt at the south and east of the Bay of Monterey, that the focus of these earthquakes must have existed somewhere between San Francisco and the bay named. Indications exist, also, that the focus must have laid between the Pacific Ocean on the west and the San Joaquin Valley on the east, on the occasions named.

Sufficient has been stated in the previous chapter to make it readily comprehensible to ordinary minds in what consists the mechanical character and effects of an earthquake; with the dissipation of the mystery which has so long enshrouded this subject, owing to the frequent anomalies which have been observed to accompany this phenomena, and formerly unaccounted for, much of the alarm which earthquakes are calculated to excite will disappear also, at least from all reasonable minds, especially if proper precautions are taken to erect our structures in future, and to adapt those already existing, to meet those telluric phenomena in the several forms in which we may anticipate their occurrence. There can be no doubt that earthquakes *may* occur, such as those at Riobamba and Jamaica, when Port Royal was destroyed, owing to the force and steep emergence of the shocks which took place at those places, from the effects of which no human structure could be erected capable of withstanding unscathed their disrupting influence. Such cases, however, occur very sparsely, as sub-ærial phenomena, but there does exist the strongest reasons for believing that by far the most tremendous earthquakes that have occurred, to the effects of which only, can the geologist point out some of the chief phenomena connected with that branch of his science which is connected with upheaval, have been subaqueous, and if space permitted, it could easily be shown that earthquakes, most probably, are far more numerously of subaqueous than of sub-ærial origin, after making all proportional allowances for the difference of surface occupied by water and land.

Although the subject of palliatives to the destructive consequences which may occur to buildings in consequence of earthquakes, was one which the writer originally proposed to have dwelled upon at some length, it never was contemplated by him to enter into much details, deeming such belonging more particularly to the architect. The lessons derived from earthquakes, relative to the erection of buildings, whose exteriors are to be composed of materials almost wholly obtainable from the mineral kingdom, are that these materials should, when used for this purpose, possess as much homogencity as possible, with a certain amount of flexibility. Rigidity in a wall and its almost constantly corresponding accompaniments, — hardness and sonorousness,—being favorable to the transmission of the shock upwards, and so calculated to throw off the uppermost series, especially if such happen to be ornamental work, unattached excepting at the base. It can scarcely be doubted that it was from this cause that at the earthquake in San Francisco, October, 1868, several instances took place of such ornamental stone-work being thrown from their positions, when surmounting buildings entirely constructed of stone and cemented with the best mortar, yet in their immediate vicinity, ornaments on brick buildings remained undisturbed, notwithstanding they had not been so well cemented into their places, and at the same time possessing forms and magnitudes better calculated to promote their overthrow. It would therefore be decidedly erroneous to select materials for building merely on account of the qualities relating to rigidity and strength, for under the rapidly dynamic influence of an earthquake shock, rigidity may easily fracture where flexibility would be uninjured.

In wood we have a flexible material, and it has been proposed to remedy the inflexibility of stone, and brick-work, by the introduction of timber-studs and tie-beams into walls. Buildings, so erected, if they did not give way partially or wholly at the first heavy earthquake shock, would, in a short course of years, be likely to become very much racked in an earthquake country by the repetition of small ones, as a consequence of the incongruous character of the associated material,—a marked instance may be noticed, by referring to the San Leandro Court House, on the occasion of the earthquake of 1868. After carefully weighing all the circumstances that are associated with the employment of mineral substances or timber, alone or in combination, for the construction of exterior or interior walls, the balance of evidence appears to be in favor of using these substances alone for those purposes; their difference of elasticity and limits of fracture being so very great. The modulus of elasticity of brick-work might however be considerably increased by making bricks somewhat thinner, say only two inches in place of two and a half inches in thickness, this combined with the fact that such diminished thickness of brick would be accompanied by a proportionate increase in the amount of mortar used, would conduce to a much greater homogeneousness of structure, provided the English bond,* according to the strict meaning of the term, is invariably employed, that, viz: every course of stretchers is always immediately overlaid by a course of beaders, and this rule ought to be enforced under severe penalties, the non-attention thereto, accompanied by the use of bad mortar, have been the sole causes of the destruction of life and chiefly of the destruction of property occasioned in this city by the earthquake of the 21st October, 1868.

A few words may be said respecting the most desirable size of bricks to be employed in the future construction of buildings. The Roman brick is described as having been seventeen inches in length by eleven in width; thickness I have not seen stated, inferring, however, from specimens which I have seen of Roman brick-work at the Flint Lead and Alkali Works, occupied by me before they were purchased by the present owners, Messrs. Muspratt & Co., I am induced to believe that they were comparatively thin, for those which I am acquainted with, found *in situ* as above stated, did not probably exceed more than one and a half, or at the outside, one and three-quarters inches in thickness. They were not, however, either so long nor so wide as the example first cited. A convenient size, in my opinion, would be 12x6x2 inches. Such a form, I believe, would add greatly to the limits of the elasticity of a wall erected therewith, as compared with another composed of ordinarily sized bricks, and if the upper stories or story of a very elevated building was constructed of hollow bricks,† and all well bound together by the very best made *lime* mortar. I have no doubt that buildings formed of walls so constructed, if erected on a solid foundation, would withstand earthquake shocks equal to those which in part destroyed Lisbon on the 1st of November, 1755, and desolated such a large number of cities in the kingdom of Naples on the 16th of December, 1857, or the South American ones which occurred during the fall of last year.

*As far as I can learn from builders, the term Flemish bond is employed in San Francisco for a mere modification of English bond.

†The advantages of using hollow bricks for the upper parts of high buildings can only be slightly referred to. One of the chief advantages obtained by their employment, consists in their greatly reducing top-weight. It is by no means improbable that the thinness of Roman bricks was the result of observing the better adaptability for resisting earthquake shocks. The chief opposition to the use of bricks of the size which I have named above, will most probably come from the workmen, as they will not be quite so readily grasped as one of four inches width.

Waste of Power.—The friction of an engine, in good order, is variously estimated at from five to eight pounds to the square inch. Often, by the use of poor oil, and allowing the engine to get out of order, this resistance is increased to twenty-five per cent. and more. It is not unfrequently the case that, from allowing shafting to get out of line, belts to be laced up too tight, and the use of unfit lubricating material, thirty pounds of steam will be required to run the engine and shafting, when less than half that amount should be required. Fifteen pounds of steam are thus lost, to say nothing of the extra wear and tear from running machinery when out of order. Very few persons are aware of the loss of money from want of power and neglect of machinery.

Idaho Correspondence.

Editors Press:—Lack of news has kept me silent for some weeks, and even now I do not know that there is much worth noting.

RETURNED FROM WHITE PINE.

Mr. Martin Clark and many others have returned from White Pine, disgusted, and the former gentleman, who was engaged in the White Pine districts prospecting, and carefully examined the various lodes of that (for no assignable reason) renowned quartz mining district, has since been to Yuba, in Altnras County, and examined that camp thoroughly, and he says that the poorest mine he saw there, if in White Pine, would create an intense excitement. He says he is satisfied to go and get a hold in that camp, as it is the richest he ever saw.

THE MONARCH COMPANY

Have purchased the mill of the late New York and Idaho Gold Mining Company at Red Warrin, Rocky Bar, and purpose to forthwith remove it to Yuba.

Mr. Atkins, the Superintendent, has on hand $60,000 at least of bullion, the result of work done this past winter, with a machine that would only work one ton a day, and that very imperfectly, but it is difficult to know anything of the Monarch Company, as they work very secretly; but the above amount of bullion has been seen, and it is known and acknowledged by the Superintendent that they have that amount, and it is strongly supposed that they have much more.

Arrangements have been made by which the Lucy Phillips Company (English) will go ahead before very long.

BOISE PLACER MINING.

Placer mines on Boise River, eleven miles above Boise City, owned by Bishop, Wagner, Ramsey and Reynolds, are said to be a good paying thing; also about thirty-five miles up, five ounces of clean dust was the result of two days' work of four men. The bar from which this was taken prospects evenly, and is sufficient for four men to work at for twelve years. There is not over two sluice heads of water without making a ditch for four or five miles.

A heavy storm visited us last night, doing much damage to mines, trees, and even fences, but to grain and gardens it was beneficial.

I send you a *Democrat* of to-day, giving an account of a horrible tragedy that has occurred in our midst. I will write whenever there is anything to write about, but times are horribly dull. Adipus.

Boise City, May 19, 1869.

American Inventions and English Claimants.—The manner in which American inventions are sometimes adopted in other countries and supplied with names that wholly disguise their origin has been exemplified in unnumbered instances, among which may be noted the so-called Paixhan gun, invented by Col. Bomford, but called after the Frenchman who introduced it into his own country; the Drummond light, devised by an American physician, but deriving its cognomen from an English lieutenant; the gas engine, first made to operate with anything like practical success by a Philadelphia inventor, but most widely known as the work of a Parisian improver; and, the "Abyssinian pump," so termed because used by the British forces in the Abyssinian expedition, although invented by an officer of the American army to meet the wants of our soldiers in the great civil war."—*American Artisan.*

American Velocipedes Abroad.—The American *Artisan* notes the following: as an admission, on the part of "our foreign cousins" of the superiority of American velocipedes over those across the water, Mr. Pickering, of New York, recently received a cable telegram from England ordering two of his velocipedes to be forwarded forthwith; the purchaser paying twenty-five dollars for the telegram rather than await the transmission of his order per steamer!

Locomotive Explosions.—No fewer than fourteen large locomotives have exploded within the past seven months in the United States, killing twenty-nine persons outright and severely wounding a much greater number.

Mechanical Progress.

Another of Howland's Rotary Valve Engines, of 20-horse-power, and weighing 1,000 pounds, has been completed at the Miner's Foundry. The same was examined, in running operation, by a number of engineers and others on Monday last. Instead of a single slide valve in the steam chest, to let on and shut off the steam alternately at the opposite ends of the cylinder, it has *two* revolving valves, one at each end; so cut away, into three arms or parts, as to let in the steam at these opposite ends of the cylinder precisely as it is required. There are several decided advantages in this arrangement: 1. The engine pulls evenly—remarkably so—whether the machine runs fast or slow, as was shown by applying a friction brake to the fly-wheel. 2. The pressure of steam being *constantly alike on all sides* of the valve, friction is avoided, the only alteration of pressure on opening communication being upon the piston, where the power is required. 3. Only one of the valves, situated at one end, will run the machine, at times when little power is required; thereby saving all the steam that must otherwise enter at the other end, equal to one-half.

The rotary valves can be easily applied to any ordinary engine, and are now applied to the large engine of the Miners' Foundry. A saving of 30 per cent. of fuel is the great point claimed in favor of this invention—due to the avoidance of friction. This claim, Mr. Howland informs us, is fully sustained by actual weighing of the coal used with and without rotary valves. The operation of an engine with these valves is most simple. After four months' use no more leakage is said to occur than ordinarily. If these claims are not counterbalanced by objections, the invention of these rotary valves, which is entirely original with Mr. Howland, is likely to prove a matter of importance in the history of the steam engine.

Flying Machines.—"The force of gravitation is the very force which is the principal one concerned in flight, and without which flight would be impossible. It is curious how completely this has been forgotten in almost all human attempts to navigate the air. Birds are not lighter than the air, but immensely heavier. If they were lighter than the air, they might float, but they could not fly. * * Being always heavier, they keep possession of a force capable of supplying momentum. * * If a bird could inhale warm air enough to make it buoyant, its power of flight would be effectually destroyed. It would become as light as a balloon, and consequently as helpless. * * All attempts to guide bodies buoynnt in the air must be fruitless. Balloons are mere toys. No flying animal has ever been formed on the principle of buoyancy. * * If man is ever destined to navigate the air, it will be in machines formed in strict obedience to the mechanical laws which have been employed by the Creator for the same purpose in flying animals."

We quote the above detached sentences from within a space of some fifty pages in "The Reign of Law,"—a new work by the Duke of Argyll. A foot-note states that there is a society established in Paris, the title of which is: "Society for the encouragement of aërial locomotion by means of apparatus heavier than the air." This indicates that the principle of buoyancy is seen by the French scientists to be a false one.

Locomotive Brakes.—Herr Krauss' plan "consists of an arrangement by means of which the blast nozzle can be closed, and the steam admitted into the cylinders through the exhaust-pipes, instead of in the ordinary way; the steam thus admitted being pumped back again into the valve chests, and thence through a valve into the chimney. The slide valves are constructed so that they cannot be lifted from their places by the pressure of the steam on the under side."—*Engineering.*

Mr. Saxby's Magnetic Test for Iron. The experiments upon bar and forged iron reported last year by Mr. Saxby will be remembered. He now announces, in a paper read before the Institution of Naval Architects, that the method of testing by magnetism is infallible with rolled plates also. A multitude of proofs may, he says, be produced. Among these he instances the following:

"A few months since I wanted a piece of the best and soundest plate iron, for use as a standard of comparison. Under permission of the Captain-Superintendent, I went to the fountain head in applying to the master boiler maker. He carefully selected a small portion of a partly-used plate which had undergone and passed all the Admiralty tests. The piece was sent to my lecture room as a sample of the very best rolled plate which could possibly be procured; and as fit for the most important work. Before cutting off the sample, he had used the precaution of punching three or four burrs from various parts of the adjacent portions for my approval; these certainly appeared to be of the finest quality. Now, I have three distinct methods of ascertaining by magnetism the quality and condition of iron; and each of these admits of results being projected on paper as a diagram. What was my astonishment when on applying my three tests to this (supposed) superlatively good plate, they severally produced a diagram which utterly condemned the sample as totally unfit for boiler use! I naturally feared a pitfall—or suspected a trick; but returned the plate to the master boiler maker as certainly unsound. I had marked the faulty spot. He and his foreman then carefully examined it, and his faith in the plate was evidently shaken. He at once cut the plate into strips, and found in them a perfect corroboration in favor of magnetic testing. I have the strips in the room and will presently show them."

Stone-Dressing Machinery.—A Glasgow machine for this purpose consists of a circular iron table, on which the rough flags to be polished are laid,—and which revolves at great speed. Upon the top of these flags, are others which are moved back and forth by an iron frame. Both are therefore polished at the same time. At a recent trial, the machine did in half an hour the work of eleven men for one day.

Action of Sea-Waters on Ships' Copper Bottoms.—The following is clipped from a paper read by Edwin Clark, C. E., at a recent meeting of the London Institute of Civil Engineers:—"The object of covering a vessel with copper is solely to prevent the adhesion of barnacles and other mollusks. This property is not due to the poisonous quality of its salts as is sometimes asserted, nor is copper used on account of its durable qualities; on the contrary, its value depends on its slow destruction. The chloride of copper formed beneath the attachment of the barnacle being a soluble salt, the creature no sooner effected a lodgement than it is at once set free by the solution of the salt; while the salts which are formed on zinc or iron being insoluble, the plate is rather protected than otherwise by the tenacious parasite. Hence the difficulty of devising an efficient paint for iron ships; for while, on the one hand, it must be slowly soluble in water to prevent this adhesion, it must, on the other hand, be sufficiently insoluble to be durable."

Cross-Cut Saw.—Leave every third tooth *straight.* Don't set it either way. File it straight and square—not at an angle as you do the others. Leave it 1-20 inch shorter than the others. The saw will cut twice as fast as one set and filed in the old way. So says a writer in the *Southern Cultivator.*

A 70-Ton Block of Iron.—The largest casting ever made in Wales was made during the last month at Landon. It was required for a steam hammer,—and weighs seventy tons. It is 11½ ft. by 9½ ft., by 7¼ ft. in size. Two or three weeks will be necessary to cool it sufficiently to be reversed;—it was cast base uppermost.

Hard Alloy of Silver.—It is said that the addition of a thousandth part of cobalt or nickel will make silver almost as hard as steel.

Scientific Progress.

The Depth of the Pacific as deduced from Earthquake Waves.—At the session of the National Academy of Sciences, which commenced April 14th, at Washington, Prof Hilgard made some remarks on earthquake waves and the depth of the ocean. He exhibited the diagrams of the tidal waves as observed at San Diego, San Francisco, and at the mouth of the Columbia River, at the time of the great earthquake on the coast of Peru last October. He had investigated the velocity of the wave by its first indications, and found that it had traveled to San Diego at the rate of about 450 miles per hour, to San Francisco at 400 miles per hour, to the Sandwich Islands at about 446 miles per hour, China 341 miles, and Alaska 326 miles per hour. Alluding to the effect on waves of depths of seas, he stated that a difference in depth of 100 feet would make a difference of two miles per hour in the rate of the wave.

From a careful examination of the facts, he had determined that the average depth of the Pacific Ocean was about 10,000 feet. He then referred to the long established idea that the sea was presumed to be four miles deep, by the method of balancing the earth by an ideal surface of half the elevation of land above the sea, and, that having considered the ideal surface of the earth as representing the surface of center of gravity of the land as above the water, and taking the earth as one-fourth, the surface and the water three-fourths, he had reached a conclusion as to the depth of the sea averaging about 12,400 feet; and that by considering the land slopes as continuing to the oceans, with a corresponding topography, he had reached the same conclusion as to average depth as by the wave element, 10,000 feet. He thought the subject worthy of careful examination and observation, as the depth of the ocean was an important element in the determination of the precession of the equinoxes.

Breathing.—An egg may be *suffocated* by varnishing it. The influx of oxygen and efflux of carbon is thereby stopped. A man inhales and exhales about a pint of air at each respiration, and makes about twenty respirations per minute; a total in twenty-four hours of 864,000 cubic inches. Of the exhaled air 4.3 per cent. is carbonic acid gas; and if the carbon of this should be separated, it would be found that an active man gives off every twenty-four hours through his mouth, a large plateful of black charcoal,—some ten or eleven ounces of carbon. To burn all this carbon in the body, the lungs have to supply every 11.1 ounces of it with 134 gallons of oxygen.

The Action of Aqua-regia on Sulphur.—M. Lefort says the dissolution of the sulphur is effected by the constant formation of chloride of sulphur, which decomposes, as soon as it forms, into sulphuric acid and hydrochloric acid. One volume of hydrochloric and three of nitric acid are the best proportions.

Glass Not Unchangeable.—*Chemical News* says it has been recently shown that all kinds of window-glass are altered in color by exposure to light; some in a few hours, others in a few years. The tints seem to be limited to purples and yellows, the purples running from pale lavender into lilac, mulberry, flesh, amethyst, rose, violet, pink, and deep purple, and the yellows through all shades of light lemon to the brightest gold color. M. Pelouse has found that glass which has been stained by sunlight is bleached by an exposure to a red heat, and that the successive coloring and bleaching may be carried on indefinately.

Glass panes, constantly exposed to the action of the sun and rain, are soon deteriorated, as the potash or soda they contain combines with the carbonic acid of the air. A whitish opaqueness is the consequence, and in order to make the pane return to transparency, it should first be rubbed with dilute hydrochloric acid, and then cleaned with moistened whiting. By this means glass in an extreme state of decomposition may be completely restored.

Absorbed, Reflected, and Transmitted Light.—Prof. Tyndall, who has been on an excursion among the Alps, in describing and explaining the color phenomena there witnessed, says: "This color of the morning and evening, and the blue color of the sky, are due to a common cause. The color has not the same origin as that of ordinary coloring matter, in which certain portions of the white solar light are extinguished, the color of the substance being that of the portion which remains. A violet is blue because its molecular texture enables it to quench the green, yellow, and red constituents of white light, and to allow the blue free transmission. A geranium is red because its molecular texture is such as quenches all rays except the red. Such colors are called colors of *absorption;* but the hue of the sky is not of this character. The blue light of the sky is *reflected* light; and were there nothing in our atmosphere competent to reflect the solar rays, we should see no blue firmament, but should look into the darkness of infinite space. The reflection of the blue is effected by perfectly colorless particles. Smallness of size alone is requisite to insure the selection and reflection of this color. Of all the visual waves emitted by the sun, the shortest and smallest are those which correspond to the color blue. On such waves small particles have more power than upon large ones; hence the predominance of blue color in all light reflected from exceedingly small particles. The crimson glow of the Alps in the evening and in the morning, is due, on the other hand, to *transmitted* light; that is to say, to light which in its passage through great atmospheric distances, has had its blue constituents sifted out of it by repeated reflection."

Bunsen on Filtration.—Prof Bunsen describes his new method of filtration in a recent number of *Annalen der Chemie.* The peculiarity of it is that, instead of allowing solutions undergoing filtration to run through the paper by the action of gravity, he causes them to be sucked through. Between the filter paper and the funnel he places a funnel of thin platinum foil fitting accurately to the glass and affording the requisite support to the frail moistened paper, exposed to a certain degree of atmospheric pressure. The tube of this funnel passes through a cork fitted into the neck of a flask, whilst a second glass tube, also passing through this cork, communicates with an apparatus which he terms a water air-pump, and by this means the air of the flask is kept in a state of rarefaction. By giving the waste pipe of the air-pump a vertical length of 30 or 40 ft., the atmospheric pressure on the liquid in the funnel becomes equal to that of 740 millimetres of mercury. Under these circumstances, solutions that by the old method filter very slowly, pass clearly through the paper with great rapidity. Bunsen experimented on oxide of chromium, which, as thrown down by ammonia' is filtered and washed out with great difficulty. A *constant* volume of a standard solution, after precipitation with the above reagent, was used in each experiment. An attempt to filter directly in the old way was unsuccessful, for after the third washing, at the completion of which 238 minutes had been consumed, the filtrate became turbid. Another quantity was then washed by decantation and finally thrown on the filter under ordinary pressure; the supernatant liquid was ten times decanted and the entire filtration accomplished in 180 minutes, the volume of the filtrate being 1750 cub. cent. When operating with the aid of the pump, the same amount of oxide was filtered and washed five times in nineteen minutes, the volume of the filtrate being 142 cub. cent.; another filtered and washed three times in sixteen minutes, yielding ninety-five cub. cent. of filtrate. A further advantage of this method rests in the fact that the precipitates are sufficiently dense and dry to allow of their being at once transferred to the crucible, paper and all, for ignition, without any fear of loss by spirting, provided only that the heating be conducted with a certain degree of caution.

The Liquid in Gem Cavities.—In the specimens of the emerald containing cavities filled with liquid, which have been examined by Messrs. Sorby and Butler, each of the cavities contains what is no doubt an aqueous saline solution, and one or more cubic crystals, probably chloride of potassium, which dissolve on the application of heat, and are deposited again on cooling. These cavities are thus analogous to those met with in the quartz of some granite, and in the minerals of blocks ejected from Vesuvius; and it seems difficult, if not impossible, to explain them, except by supposing that a strong saline solution was caught up by the mineral at the time of its formation.

Farming and Gardening.

Plant Apple Trees.

There is no fruit so widely diffused, or so generally useful and healthy as the apple. Why every man in possession of a half or even a quarter of an acre of gound does not raise apples, we never could comprehend; and the sight of a farm or ranch without apple trees, and a general assortment of fruit, has ever heen, to us, a matter of astonishment. A well-planted orchard of choice trees will pay far hetter than most of the feet in White Pine; and a farm, with even a small showof such trees, is worth from $500 to $1,000 more than one without; while a sufficient quantity of fruit can generally be obtained therefrom, the third year, to pay for all the cost of setting out and cultivation.

The apple is a hardy tree and possesses a wonderful power of adaptation to any soil or situation. To say nothing of our great valleys, it has heen proven to do admirably well all through the mountains of California. A few years ago it was feared, and strenuously maintained hy some, that the business of raising fruit was even then overdone in this State; hut the dearth of the market in this city during the winter months, is a sufficient answer to any such objection. Good fruit is never sold in San Francisco at a low price, and the consumers are increasing in a greater ratio than the producers.

Fruit farming requires skill, discrimination and judgment; and when these qualifications are brought to bear upon it, there is no such thing as failure. It costs no more to raise good fruit than poor; while the former will sell for twice as much as the latter. Some fruit-raisers, hy forgetting this fact, fail of success, and denounce the business; but such cases should not discourage intelligent men.

Failure as often comes from bad culture as from poor fruit. We have heard of a Pennsylvania farmer, who put a large flat stone under his trees to keep the roots near the surface, that they might always grow in good ground; but the contrary things *would* turn down when they reached the edge of the stone, and go hunting for moisture. Those who stick their trees a few iuches into the ground, without any previous preparation, are just as foolish. In both cases they raise only deformed trees, poor fruit and hut little of it.

To set out a tree aright, be it ever so small, the hole should be dug at least two feet and a half to three feet in depth, and from three to four feet across. In filling in, no "hard pan" should go hack; fill in with fresh earth, plentifully and intimately mixed with chip manure, or something similar, which will he slow in decomposing, and furnish plant food for a long time. A little air-slacked lime, with ashes and bones, should also he intimately mixed with the soil. Let no manure come in direct oontact with the roots; place against them only finely pulverized, earthy compost.

The ash of the apple tree contains ahout 70 per cent of lime; hence that mineral should always form an important ingredient in the compost applied to it, either ahove or below ground. The surface compost applied to fruit trees should always he varied in accordance with their physical wants, as shown hy the chemist in his analysis of their fruit and wood. Apples require an excess of lime; pears an excess of potash; plum and quince trees require salt; peach and cherry trees should he plentifully supplied with ashes, while grape vines require lime, ashes and plaster (gronnd gypsum).

A healthy, vigorous tree will withstaud the attacks of insects and drought much hetter than a sickly one, as well as prove more productive of fruit. As yet, fruit-growers in California are not much troubled with insect pests. The orchard caterpillar is the only one that has made its appearance on our apple trees. The apple moth, which has not yet reached the Pacific coast, is the most troublesome and annoying of all the pests which afflict this tree. This is the insect which defiles that delicious fruit, hy depositing its eggs thereon, during its early growth. The eggs are not laid in the blossom, according to the general idea, hut in the fruit itself, as the insect does not assume its winged state until the blossoms have disappeared, and fruit has set. The larvæ, after having despoiled the fruit, seeks the most convenient refnge for its transformation. This is usually found under the rough scales of the bark; hence the advantage of scraping the trees and washing with strong suds or lime water to kill the "varmints." A good trap for them is made hy winding a rag or wisp of hay around the hody of the tree. They will crawl under such a shelter, especially if the hark is smooth—from whence they can he easily dislodged and destroyed. It would be well for Californians to keep a good look out for these insects, and declare a general war against them at their first appearance. By so doing we may continne to raise apples free from worms, which we can eat with a relish even in the dark.

Market Gardening.

The industrious market gardener, on his six or eight acres of well tilled soil, with a variety of productions, is quite as sure of acquiring independence, as the large farmer with his hundreds of broad acres, waving with whcat or barley as his only crop. The reason of the general lack of success in the large farmer, is the want of variety in his crops, and the lack of care in preparing his ground for their growth. By a fortuity of circumstances, he may sometimes make a great deal of money hy a single crop—as did onr wheat growers, who, two years ago, sold their grain for two dollars and upwards per cental; hut now, when wheat is down to $1.50, and lower, there is very little margin for profit, unless the farmer puts in his own time to help out; for he has but one product to depend upon.

Not so with the market gardener. Outof his variety he is sure to make money. He is not dependent upon a single article. If he lose on one he is sure to make up his loss on another. Again, the market gardener, generally cultivates with care. His lahors are necessarily confined to a small tract of land, and he must get all he can off from it. He plows deep, he rotates his crops, he has a care that his land does not become exhausted; hut constantly renews hy a judicious application of manures, the fertilizing elements which he is aunually removing, hy taking away his crops. Hence success invariahly crowns his persistent efforts. All successful market gardeners argue that it is hopeless to attempt to grow crops without the yearly application of fertilizers in large amounts and so varied in character as to meet the peculiar conditions of the soil, and the especial requirements of the crops produced. We notice that large quantities of mannre are daily hauled out of this city, miles distant, to keep up the condition of the gardens which supply us with vegetahles. If our large interior farmers would profit by this example, and more generally apply condensed fertilizers to their lands, they would greatly increase their products of wheat, barley, potatoes, etc., and at a less proportionate expense for cost than they now have to meet.

Henderson, in his work on gardening, says: I never yet saw soils of any kind that had horne a crop of vegetables that would produce as good a crop the next season without the use of manure, no matter how rich the soil may be thought to he. An illustration of this came under my observation last season. One of my neighbors had it in prospect to run a sixty-foot street through his grounds; thinking his land sufficiently rich to carry through a crop of cabhages without manure, he thonght it useless to waste money hy using guano on that portion on which the street was to he, hut on each side sowed guano at the rate of twelve hundred ponnds per acre, and planted the whole with early cahhages. The effect was the most marked I ever saw; that portion on which the guano had heen used sold off readily for abont $1400 per acre; but the portion from which the guano had heen withheld realized less than $400 per acre. The street occupied fully an acre of ground, so that my friend actually lost over $1000 hy withholding $60 for manure. Another neighhor with a lease of only one year to rnn, also unwisely concluded that it would be foolish to waste mannre on his last crop, and so planted and sowed all withont; the result was, as his experience should have taught him, a crop of inferior quality in every article grown, and loss on his eight acres of prohably $2000 for that season.

Flowers.

California wild flowers, while they send out hut little odor, more than compensate for that deficiency in their abundance, variety and exquisiteness of form and color. There are few flowers in the garden which embody more beauty and brilliancy thsn do the wild ones that hespaugle our broad plains, ornament our grassy hillsides, or cling with tiny rootlets to the rocky surfaces of our steep, mountain declivities. At this season of the year, they are seen everywhere, out of the trodden marts of commerce, spread out in the greatest profusion, howing and waving their heautiful heads,—wonderful pictures upon nature's carpet, beautiful ornaments in her lofty niches. The sun tonches them teuderly, painting upon their delicate surfaces the hrightest colors; the winds dally with them gently, and the storms heat lightly upon them, and only to nourish and invigorate. We always had a passion for flowers,—flowers in the field, in the garden, in the window, among the trees—flowers everywhere.

Every flower is a green syllahle in Nature's language; every clnster is an illuminated sentence, written out upon one of her broad pages. He who reads not or cares not, shows a lack of taste, and holds up a mirror to his inner life, in which all who look must observe a want of the finer sensihilities which most elevate and enrich the cultured mind.

San Francisco is fast hecoming a city of flowers; and it is pleasant to see those engaged in the active pursuits of life; and ladies, too—as we sometimes do see—devoting a portion of their time to the floral decoration of their homes. It shows that their hearts are alive to the sweetest influences of nature, and that the hetter feelings of the sonl rise ahove the sordid love of gain, or the morhid delicacy of cushioned, silk-clad ease. It is well to make these heautiful forms of nature the ohject of personal care. This culture will create a living spring of hope within us, make our homes heautiful, lovely and happy, strengthen our family ties, and send forth a spiritual fragrance that will rise like incense from the altar, to guide ns onward and upward to the pearly gates within which are flowers that never fade and forms which never grow old.

Atlantic Flowers.—A hunch of flowers were exhibited in this city on Friday which hloomed in New York, and were brought directly hy rail, retaining their hrightness and fragrance.

Amateur and Scientific Farming.—Mr. J. H. Hall, a member of the Farmers' Club and New York State Poultry Society, has purchased a farm on Long Island for the purpose of testing general questions of interest in agriculture. One of these is the value of artificial manures, the profitable growing of imported seeds from Washington and the feasihility of raising poultry on a large scale, Dr. Pratteree, of the Eccaleobion celebrity, has kindly consented to aid him in the hatching of eggs by the hundred with his imported and improved machine.

Farming Profits at the East.—Mr. Rankin, of Monmouth, Illinois, last year, raised 575 hushels of corn on five acres of ground, which he sold for forty-five cents a bnshel, realizing $258.75. The total cost of raising the same, inclnding $25 allowed for rent of ground, was $86.50; leaving $172.25 net profit—or $34.45 per acre.

Mr. Brerras, of North Fairfield, Huron County, Ohio, reports a net profit of $28.76 per acre on 13¼ acres, planted in corn and pumpkins.

Mr. R. A. Leonard, of Monmonth County, New Jersey, reports a profit of a small fraction short of $80 per acre on eighty-five acres of land, devoted chiefly to asparagus, potatoes and tnrnips. We condense the ahove from the Report of the Department of Agricnlture for February.

George Waring says the farmer who spends $300 an acre in manuring his vegetahle garden, is likely to make $500 an acre.

Value of the Pacific Railroad Lands.—The value of the land subsidies to the Overland Railroad is worth mnch more on the Central than on the Union portion of the ronte. The latter, deducting the worthless portion, have ahont 6,500,000 acres, from which they will prohahly realize their maximum price of $2.50 per acre—realizing, in gross, $16,250,000. The Union Company, althongh they have built the greater numher of miles of the road, and have a larger area of land, will not he able to realize from more than one-quarter of the same—say 2,200,000 acres; which at $2.50, will yield them only $5,500,000.

The Mining and Scientific Press is regarded wherever known as one of the most reliable newspapers published on the American continent. It is devoted to the mining and manufacturing interests of the Pacific coast, and has correspondents in all sections of the country.—*Colorado Register.*

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

San Francisco, May 29, 1869.

Financial.

There is no disguising the unpleasant fact that the San Francisco money market is undergoing a very severe pressure. Money is scarce—remarkably so—and rates have been put up in proportion. The most favored borrowers are paying 1½@2 ₱ cent. per month, while many stock brokers give 3 ₱ cent. for minute money. There is an indefinable sense of depression in business circles arising mainly from the scarcity of money. There are $8,000,000 locked up in the Sub-Treasury; $1,500,000 in the State Treasury, and a large sum in the City Treasury. Much money has been sent East to take advantage of the rise in gold in that market. Large sums have drifted toward White Pine, where it remains locked up or gone East, and for paying the laborers on the Central Pacific Railroad. Other large amounts have been consumed in making extensive city improvements. Homestead associations, which have been carried to the pitch of speculation, have absorbed heavy sums in small installments. Our domestic produce has declined so much in price that to express the same value requires twice the quantity requisite one year ago. The Chinese have got possession of much coin and keep it secreted and out of the market. A project is on foot to utilize these means by establishing a Chinese savings and loan society. It has found favor, ostensibly, with leading Chinese merchants and the heads of their great companies; but it is barely possible that Chinese funds are already employed by the Chinese companies and leading merchants. A variety of other reasons may be assigned for the existing stringency. One hopeful feature is the fact that deposits are increasing slowly in some of our savings and loan societies, showing that some of the money is returning.

We quote bullion in fair supply. Gold bars rule from 880@890; silver bars from par to ¼ per cent. premium; currency bills on Atlantic cities pay 36 per cent. premium on gold; coin drafts, 1½ per cent. premium; telegraphic transfers, 2 per cent. premium; sterling exchange, 483¾d; commercial do, 49¾d. Mexican dollars bring from 5@6 per cent. premium. $280,000 Mexican dollars were received by the U. S. steamer Mohongo. Government seems determined to compete against our merchant marine for the transportation of specie.

There is a great deal of doubt existing with reference to the effect which close commercial intercourse with the East will have upon our currency. Some tenaciously hold that greenbacks will be forced upon our acceptance, while others incline to the belief that our gold and silver will maintain their position. We cannot conceive how we are to be affected by the closer contact. We have for some time been witbin two weeks' reach of New York, and have had the telegraph for years without disturbing our currency in the least. The shortening of time one week can make no difference. All that could have been done in this line has already been done for years by the telegraph. If Eastern merchants come here to purchase they must expect to make the same arrragements they would if going to Europe. If they use greenbacks they must part with them at the market price, and those greenbacks will be needed by Government for army, navy and civil disbursements on this coast. No injury has ever resulted from the annual shipment of from twenty to thirty millions of greenbacks to California by the Government. None will happen from any business transactions with Eastern merchants. With a plentiful supply of paper currency we can enter Eastern markets, make our purchases and keep our specie for home and foreign requirements. If anything, an increased influx of paper money will prove quite a relief from the incessant drafts of gold and silver to which we have been subjected. Paper will serve as the medium of exchange between the East and the West, and for this purpose will take the place of our gold and silver. We think all fears on this subject ill-grounded.

City Stocks.

During the past fortnight very considerable sales of Spring Valley Water Co. stock were made at $66 12½ and $66 per share. With regard to other miscellaneous securities the open market is exceedingly quiet, in fact it is rather difficult to make any sales of this nature at present, as no very great demand exists, and other channels afford more remunerative terms under the present stringent condition of the money market.

Among the numerous incorporations effected through our Courts, we note the following:

Oriental Fire and Marine Insurance Company. Capital, $100,000 in 1,000 shares of $100 each. Trustees—John Bell, H. H. Bancroft, J. N. Eckel, J. R. Jarboe, J. R. Sharpstein, Jacob Decth, T. H. Hatch, H. Rosekrans, H. Epstein, and Wm. H. Sharpe.

The returns of our local insurance companies to the Internal Revenue department for the month of April and previously this year have been as follows, upon a currency basis of 74 cents on the dollar for the month of January, 77½ cents for February and March and 75½ cents for April:

	April.	*Previously this year.*	*Total.*
Pacific	$110,292	$273,072	$383,364
Union	48,781	138,086	186,867
Fireman's Fund	22,844	93,073	115,917
California	10,036	33,155	43,211
Merchants' Mutual Marine	35,843	67,310	103,153
Occidental	27,490	57,735	85,225
Home Mutual	13,171	41,368	54,539
Peoples'	18,548	42,153	60,701
Total	$287,115	$742,972	$1,030,087
Same time in 1868	164,442	506,154	670,596
Increase in 1869	$122,673	$236,818	$359,491

The above statement shows a falling off of $24,264 from the receipts in March. The receipts of the several companies in April as compared with March show the following difference:

	Increase.	*Decrease.*
Pacific	$3,941	.....
Union	.....	12,130
Fireman's Fund	.....	27,122
California	.....	2,295
Merchants' Mutual Marine	5,150	.....
Occidental	.....	99
Home Mutual	.....	816
People's	5,067	.....

The receipts of the city railroads for the month of April and previously this year were as follows:

	April.	*Previously this year.*	*Total.*
Omnibus	$28,869	$68,987	$97,856
North Beach & Mission	23,084	64,927	89,988
Central	17,153	43,542	60,695
Front Street, Mission & Ocean	9,477	24,560	34,037
Market Street	12,355	30,928	43,183
Potrero and Bay View	3,220	7,035	10,255
Totals	$93,105	$237,959	$331,064
Same time in 1868	79,788	212,834	292,622
Increase in 1869	$13,317	$25,125	$38,442

As compared with the total receipts in March, we find a gain of $1,990. The receipts of April as against March show the following difference:

	Increase.	*Decrease.*
Omnibus	$1,429	.....
North Beach and Mission	1,042	.....
Central	894	.....
Front Street, Mission and Ocean	498	.....
Market Street	710	.....
Potrero and Bay View	317	.....

The Exports of Treasure from May 1st to date, have been as follows:

May 4—Per Japan—		
To China	$672,182 42	
To Japan	661,739 06	$1,333,921 48
May 8—Per Colorado—		
To New York	$132,445 46	
To England	193,865 73	
To France	32,101 50	
To Central America	251,903 59	
To Panama	20 000 00	630,116 28
May 18—Per Constitution—		
To New York	$ 69,530 00	
To England	238,951 57	
To France	137,648 68	
To Central America	279,567 10	
To Panama	20,000 00	745,697 35
Total since May 1st, 1869		$2,709,733 11
Previously this year		13,260,458 87
Total since January 1st, 1869		$15,970,193 98
Corresponding period, 1868		15,623,791 94
Increase this year		$346,402 04

The duties paid at the Custom House, in this city, from May 17th to date have been as follows:

May 17	$35,699 30
May 18	19,181 72
May 19	37,158 08
May 20	14,559 21
May 21	22,717 36
May 22	14,131 20
May 24	25,000 03
May 25	23,287 87
May 26	16,605 83

Mining Share Market.

During the week under review the mining share market exhibited less activity than for quite a number of weeks past, and the tendency has been to lower rates. With regard to the White Pine bullion product a contemporary remarks: We learn from good authority that the bullion yield of the White Pine mines for the single month of April exceeded that of the Comstock Lode for the first two years of its exploitation. This is an important fact, foreshadowing as it does the immense mineral wealth of White Pine. But there is no doubt whatever that other sections still more interior will be earafter be found equally rich. The mineral wealth of the Pacific coast will be developed much more rapidly hereafter, as the success attending White Pine discoveries will induce an army of explorers to extend their prospecting tours to contiguous regions, while the improved methods of treating ores must eventuate in giving a fixed value to mines now not among the paying class.

Imperial—was in the market to a less extent than usual, with some abatement from prices obtained during the previous week. A telegram of the 26th inst. states that the bottom of the shaft and the south drift are in quartz and clay, the west drift continuing in porphyry. On the 20 inst. $7,548 in bullion was sent forward to the office in this city.

Hale & Noncross—shows but little change from sales made last week, both in quantity and prices. During the week ending May 22d, 11.78⅘ tons of ore were extracted, the assay value of which is not reported, and during the same time 933 tons were delivered to custom mills for reduction, leaving on hand 1,288 tons. A connection has been made of the north drift in the fifth level with the breast in cross-cut No. 3, and by this means the ventilation has been materially improved. A drift has been run, and a car track laid through the centre of the vein from cross-cut No. 1 to the northern end of cross-cut No. 3, and is reported to show a continuous body of excellent ore the whole distance. On the 20th inst, $8,473 in bullion was sent forward to the office in this city.

Chollan-Potosi—improved rapidly since our previous reference. For the week ending May 21st 1,416 tons of ore were mined, and 1,187⅘ tons were sent to custom mills. We learn that the Blue Wing development is looking well, and producing largely. As the work is being carried west new deposits are found, the supply increasing almost as rapidly as they exhaust the portions already developed. In the new tunnel, on the second floor, 120 feet north from the main adit, the stope is 12 feet wide, and no wall to the west, with good ore. Spots of quartz are reported to be found in the new shaft developments. At a later date the Blue Wing continued to improve, but no changes were noticeable in the shaft.—On the 25th of May the Ophir drift was in a distance of 308 feet.

What an Indian Said of Plantation Bitters.—A little before the commeacement of the buffalo season on the plains this year, two Kiowa chiefs came to Fort Hays, Mo., to obtain powder and ball. As they belonged to the "peace party" of the tribe their wish was complied with. One of them then expressed a desire for "two, tree, five bottles heary good medicine," but could not remember the name of the article he wanted. It was finally recollected that the winter previously a couple of bottles of Drake's Plantation Bitters had been given to one of the chiefs by an officer in the Fort, and it appeared that the red-skin was eager for more. On asking him what he thought of the cordial he promptly replied that it was "berry bad stuff for Injun to take when no meat in wigwam—it made him so hungry—but berry good when buffalo plenty, 'cause it gave him big appetite, and he eat, eat, eat, till he get fat an' stroag." Probably a finer compliment was never paid to the famous vegetable tonic and restorative than this bit of bad English from an unsophisticated Indian. It not only cures indigestion, but impants, so to speak, a *clamorous* appetite. *

Weekly Shareholders' Directory, for Meetings, Assessments and Dividends.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Company Transactions.

New Incorporations.

Articles of incorporation have recently been filed in the County Clerk's office in this city, as follows:

San Francisco and Reveille M. & M. Co.—Capital stock, $500,000; 5,000 shares, $100 each. Trustees: Charles Lambert, F. F. Low, J. H. Blood, W. W. Dodge and G. W. Gordon.

State University H. A.—May 22d. San Francisco. Capital stock, $50,000; 100 shares, $500 each. Trustees: O. P. Fitzgerald, Edward Tompkins, A. J. Moulder, Theodore Bradley, George Tait John Swett and James Stratton.

State University H. A., No. 2.—May 22d. San Francisco. Capital stock $22,000; 40 shares, $550 each. Trustees: Rev. L. Hamilton, E. C. McComb, George Tait, Warren Holt and J. D. Littlefield.

Oriental Fire and Marine Insurance Co.—May 26. San Francisco. Capital stock, $100,000; 1,000 shares, $100 each. Trustees: John Bell, John R. Jarboe, H. Rosekrans, H. H. Bancroft, J. R. Sharpstein, H. Epstein, Jacob Deeth, J. N. Eckel, T. H. Hatch and W. H. Sharp.

San Mateo City H. A.—Capital stock, $220,000. Trustees: Leland Stanford, M. S. Latham and Gustave Mahe.

The following were filed in the office of the Secretary of State, Sacramento:

Starfield Mining Co.—April 22d. Sacramento. Capital stock, $400,000, in shares of $50 each. Trustees: James McDonnell, Robert Wallace, Edward Doyle, Joseph M. Williams and Thos. Robley.

San Lorenzo Creek W. Co.—May 22d. Sacramento. Capital stock, $120,000, in shares of $100 each. Trustees: A. S. Fuller, William Meek and G. E. Smith.

Meetings, Elections, Etc.

When not otherwise noted, the following elections may be considered as having been held in San Francisco:

Mining.

Continental S. M. Co.—May 22d. Trustees: C. T. Fay, (President) H. M. Blake, (Secretary) E. K. Howes, Wm. B. Swain and J. A. Eaton.

Phœnix M. Co.—May 24th. Trustees: J. C. L. Wadsworth, J. D. Fry, W. C. Parker, G. F. Walter and A. Cannon.

Bowden S. M. Co.—May 24th. Trustees: R. Sherwood, M. Tubbs, E. E. Haft, P. B. Clark and James Patterson.

Keystone M. Co. have filed a certificate of increase of capital stock from $50,000 to $250,000. Certificate signed by J. M. McDonald, President, and Louis Vesaria, Secretary.

Miscellaneous.

Oregon Central Military Road Co.—Election at Eugene, Oregon, on the 24th, to increase the capital stock to $200,000.

Columbia River M'fg Co.—27th inst. Officers elected for the first three months: President, J. B. Knapp; Vice President, N. W. Spaulding; Secretary, S. W. Backus; Treasurer, D. W. Grant.

Los Angeles and San Pedro R. R. Co. Los Angeles, 15th inst. Directors for the ensuing year: J. G. Downey, M. Keller, P. Banning, O. W. Childs, J. S. Griffin, S. H. Mott, John King, H. W. Hellman and Wallace Woodworth. The Board of Directors subsequently elected Hon. John G. Downey, President; O. W. Childs, Vice President; Col. T. L. M. Chipley, Secretary; S. H. Mott, Treasurer; and Col. Flint, Engineer.

California Steam Nav. Co.—May 24th. Trustees: B. M Hartshorne, W. H. Taylor, A. Redington, Lloyd Tevis, A. Hayward, S. F. Butterworth, W. C. Ralston, C. L. Low and William Alvord.

Hamilton Square H. A.—May 24th. Trustees: E. Bauer, (President,) B. P. Avery, (Vice President,) Robert White, (Secretary,) Charles Kaeding, (Treasurer,) and David Norris.

The reason why Muller's Spectacles meet with such unbounded success, is owing to his knowledge of the wants of the eye and his ability to adapt glasses to its various conditions. Try him. 205 Montgomery street. *

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

Tarshish.—*Miner*, May 15th: Every day brings a quantity of good ore, and every day the Director becomes more convinced of the value of the mine.

Imperial.—Twenty feet run last week in this tunnel. This week a stratum of talc was cut and porphyry entered. This belt of porphyry is thought to be about 50 feet wide, and commands the western approach to the first lode of the Imperial series.

Pitching In.—Mr. Ray is going ahead with his tunnel on the Mountain claim, at the rate of 10 or 12 feet a week, encouraged by the near approach of Monitor mill to completion.

Morning Star.—An assessment of $1 per share is levied by this company.... The Pittsburg Co. are steadily making headway in their tunnel up Scandinavian Cañon..... The Pennsylvania Co. having drifted each way on the casing of their lode 50 feet, are now making cross cuts to test the ore.

Giant Powder.—*Chronicle*, 15th: The Mountain Co. has commenced the use of Giant Powder.

AMADOR COUNTY.

Coney.—*Ledger*, May 25d: The new shaft is down 85 feet, through good rock. When 100 feet steam hoisting works will be erected. From the old shaft they are raising rock sufficient to supply their own mill, the Kearsing, and it is the intention to commence, in a few days, hauling ore to the Hardenberg. The chlorination works are kept in full blast night and day. The prospects of the company never looked more flattering.

BUTTE COUNTY.

Inskip.—Oroville *Record*, 22d: This locality is again attracting attention. Recently a stratum of earth has been discovered which prospects very rich, is quite extensive, and affords opportunity for hydraulic operations. Mr. S. L. Dewey and others, engaged in opening the claim, are confident that they have struck hydraulic diggings that will equal those of Timbuctoo or Oroville.

CALAVERAS COUNTY.

Petticoat.—*Chronicle*, 22d: The machinery has been removed from the old shaft to the new, the mine freed from water, and the shaft sunk 128 feet, all at an expense not exceeding $3,000.

INYO COUNTY.

Kearsarge.—Gold Hill *News*, 24th: Gen. Winters and Charles Van Gorder, both stockholders, returned to Gold Hill a day or two ago, from a visit to the Kearsarge mine and mill, Owen's Valley. The object of the visit was to make arrangements to start up the mine and mill.

NEVADA COUNTY.

Miners.—*Gazette*, 18th: Miners from Australia who arrived in Nevada on Saturday, have been employed by the Banner. These men are accustomed to the single-hand drill, and are willing to use the giant powder.

Sheriff's Sales.—Same, 19th: The Sheriff, yesterday, sold on execution the property of the Nevada Quartz Mining Co., of the Coe Co., and the Jackson ranch. The Nevada mine is on Deer Creek, a mile below town, and has a twelve-stamp water mill. It was sold on a judgment in favor of Michael Reese, and was bid off at $14,300 by Mr. Allen, agent for Reese.

Allison Ranch.—Same of 20th: They are now pumping out water from the lowest level, 300 feet perpendicular. On Saturday it is expected the mine will be free from water. The shafts and tunnels, and all the timbers in the mine, are as perfect as when the mill closed down two years ago. Thousands of tons of waste ore from the old dumps are being crushed at their 12-stamp mill, about thirty tons in twenty-four hours. They have enough to keep their mill running six months. A large amount of this waste rock was taken from the best portions of the mine, and is very rich.

North Star.—21st: This mill starts up this morning to crush 200 tons of good rock, that it is estimated will yield about $10,000. The owners thought best to have the rock on hand crushed and out of the way and then close down until permanent arrangements can be made about working the mine. Yesterday the company paid off their men, the amount of over $15,000.

Buckeye Co.—*Transcript*, 18th: After the last run, on Saturday they cleaned up $4,000. This company purchased a tail flume in Sweetland creek five or six months ago. This is cleaned up every week or so, and the company will have paid, in a short time the cost of the property, and improvements.

Improvement.—Same, 19th; The North Bloomfield Gravel Mining Company are surveying the line for the purpose of extending their ditch from Little Cañon to Big Cañon Creek. They will put 100 white men and as many Chinese as they can get upon the work, and hope to complete it in sixty days.

You Bet.—20th: Timmons & Co's claims are yielding handsomely. Neece & West are getting ready for washing off the surface in their cement claims. Brown Bros. continue to take out large amounts from the blue cement claims at every run.

Empire.—Grass Valley *National*, 22d: Captain Lee, of the Empire, secured the services of forty miners, most of whom are Americans, and will go to work on Monday and Tuesday. As soon as enough rock is taken out for crushing, the mill will be again started up.

Dromedary.—*Union*, 19th: It is reported that the mine will be pumped out and work resumed as soon as arrangements can be made. It passes into the hands, rumor has it, of Frank Morse.

Allison Ranch.—Same of 22d: Day before yesterday the noses of the pumps struck the mud, and the mine is now free of water. It is the intention of the company to sink deeper on the ledge and to open up new levels, before they take any quartz out of the now opened levels.

PLUMAS COUNTY.

Argentine.—Quincy *National*, 15th: The miners are doing extraordinarily well. Heath & Co. are making $20 per day to the hand, sluicing. Killey & Archer have completed their bedrock cut, and commenced taking out pay. Their claim is considered good for an ounce per day to the hand.

Twelve-Mile Bar.—On Rich Gulch, Conrser & Jackson have been piping for some time. They will commence cleaning up after two weeks' further run. McBeth & McNecly are still sluicing, but will be done in a short time. Their prospects are good.

Sheezer & Co., on Dinghat Flat, have commenced to clean up. Hallsted, Mower & Co., on Terry Hill, have piped off a large amount of ground, and will not commence cleaning up until water fails.

Hyde & Co., and a Cornish Co., on 12-Mile Bar, have been doing moderately well.

Some work will be done in the river. Ward & Brown will put in two flumes, one in their old claim below 12-Mile Bar, and the other above Dutch Bar, adjoining the old Hardsock claims.

SANTA CLARA COUNTY.

New Almaden.—Grass Valley *Union*, 22d: We are informed that the expenses for labor of the New Almaden quicksilver mines have been heretofore about $40,000 per month, and that with the use of Giant Powder this can be reduced to $30,000. The men object, and it is probable that the mine will be closed until men can be found who will work the new explosive.

SIERRA COUNTY.

Scales' Diggings.—Correspondence of Downieville *Messenger*, of 22d: The miners here are doing very well this season, but the water is failing fast.

SISKIYOU COUNTY.

Cottonwood Quartz Ledges.—Yreka *Union*, May 22d: A tunnel has been extended into the Norfolk from 45 to 50 ft. on the ledge; the ledge is two feet thick, and the rock of the richest character. This ledge has increased steadily in size and richness as they have gone farther into the hill. The Lodi, also, though neither so large a ledge nor apparently so rich, is developing rock that sparkles with gold, while the ledge has increased from 8 or 10 inches up to 15 inches in thickness.

Changed Hands.—Coughlin, Daggett & Co., of the Black Bear Quartz Co., on Salmon, have purchased the Union Quartz mill and ledge. The Union is a steam mill, and was built some five or six years ago, in a most substantial manner, with all the improvements then known.

TRINITY COUNTY.

Good Pay.—*Journal*, 22d: Twenty-four hundred dollars was recently taken out of a claim on the west side of Trinity River, known as Field & Culver's; the result of 56 days' drifting by four men.

Letter from Trinity Center: Stotson & Crocker have opened a paying claim, in the hill, 200 yards south of Hatchet Creek. Whitmore & Boynton are at work with apparently good fortune. Tom Coyle's claim is paying better than at any previous time. A company is organizing for the purpose of opening a river claim at the mouth of Snow Gulch, three miles north of town. Work will be commenced about the first of July. Weeden's discovery, on Mule Creek, near Minersville, has created a stir in that neighborhood, and five or six companies are already at work. The claims are undoubtedly good, and there is ground to work for several years.

YUBA COUNTY.

Pennsylvania Mine.—*Appeal*, 25th: We learn that the water has been pumped out to near the lowest level, and the Superintendent is engaged in retimbering. It is expected that the mine will commence crushing next week, there being any quantity of first-class rock accessible.

ARIZONA.

Prescott *Miner* May 1st: The Sterling is looking better than ever. The Montgomery is looking fine. So is the Chase, Tie-Tie, and other ledges now worked. The news from the placers is fully as good. At Black Cañon, on the Upper and Lower Hassayampa, at Weaver, on Lynx creek, in Big Bug district, the miners are doing well. Lynx creek, in Mr. Shoupe's claim, two men, in two days, shoveled into the sluices fifty-four dollars.

The following items are from a Prescott letter of April 25th, to the *Bulletin;*

Sterling.—Everybody busy making preparations for the new 10-stamp mill shortly expected. Several hundred tons of ore have been worked in the old battery, some of it yielding as high as $32 per ton in free gold, the great bulk of gold being left in the sulphurets, to work which chlorination works have been erected. There is a great abundance of ore, and if there is no hitch in the extraction of the gold, I predict for this mine a brilliant success. It is owned in San Francisco. I saw some 50 pounds of sulphurets from the mine, worked in your city, that yielded $484 per ton. Assays recently made here go over $600 per ton. * * From a small vein running under the Sterling mill. I was shown some beautiful specimens of silver ore. All around here are ledges on which more or less work has been done, and nearly all of which make sufficient show to warrant exploring them further. With such a delightful climate, such agricultural resources, and such an abundance of wood and water, mining ought to be carried on here almost as cheaply as in California, and more cheaply than in Nevada. If this country were opened by the 35th parallel railroad, the section immediately around Prescott would produce more bullion than Nevada produces to-day.

COLORADO.

Ward District.—Central City *Register*, May 13th: It is reported that the Ni-Wot Company's property has changed hands, that Ed. Larned and C. P. Dixon, of New York, and Theodore Pomeroy, of Pittsfield, Mass., are the owners, and that an English Company associated with them will erect smelting works after the Swansea plan.

Trail Creek.—A. S. Bennett is putting in a foundation for a stamp mill. He will run seven stamps and pans, on ore from the Cleveland lode. Dr. E. F. Holland, on the Coyote and Kelley lodes, is taking out some very rich ore. We saw several specimens, showing free gold. Two miles up, at the old town, Judge Colvin is putting in a foundation for a 10-stamp mill. It will have pans and Bruckner furnaces. The Colvin Company's best mine is on the Freeland lode, the best vein yet opened in the district, it having been worked for a distance of over 4,000 feet. John Schriver is going to work on the Mayflower.

Richard White took out with two men last week in Russell's Gulch, 6¾ ounces of gold, worth $21.75 per ounce (currency). Two cords of ore from L. A. Klein's claims on the German lode, has been crushed, which yielded over 18 ounces gold per ton. ....California Gulch is the center of excitement, owing to the discovery of a wonderfully rich lode. A specimen valued at $500 is now on exhibition at Denver, with about $1,500 fine gold that had been panned from the crevice material during the past month or two.

There were running yesterday, from the Kip mill down, 500 stamps. There are 45 in Lake Gulch, 12 in Russell, in Nevada over 100, in Leavenworth Gulch and on Quartz Hill 32, in Eureka 30; making a total of 717 stamps running in the county. One hundred more will be ready in a few days. The great want is transportation. Sid. Parent is opening the Andy Johnson lode, on Bobtail Hill. It pays five ounces of gold to the cord.

Briggs Mine.—Eighteen men raise 35 cords of ore per week. About 15 tons is selected out and sold to the smelting works at an average of $60 per ton. The balance is run under stamps, yielding 6½ ounces per cord. They keep their 50-stamp mill running constantly day and night, besides selling nearly $1,000 worth of smelting ore per week. Some of the ore is exceedingly rich.

North Empire.—This camp is reduced to a population of thirty, but these are all busy, and most of them making money. The principal mines now worked successfully are the Conqueror and Equator. The former is owned by the Disbro Bros., who have a shaft 250 feet deep, with a large frame house over it, enclosing a 30-horse steam engine and boiler, spool hoisting works, etc. In the shaft their crevice is nine feet, but as they have to haul their ore over two miles, they only save the best streak, which yields $200 coin per cord. The balance, worth $75 per cord, is thrown over the waste dump. Cheatley & Mack, on the Equator, have a vein of pay ore from 12 to 20 inches in width. None of it has been reduced yet, but it prospects $200 per cord. They have three arastras, one of which is running.

Lake County.—Denver *News* correspondence, May 12: Major Harry Hill, on the Yankee Blade, has sunk 20 feet in two weeks, with a 10-horse power engine to pump. The weather having cleared up, operations will commence on the gulch claims. The Gaff Company have started in. For the last month parties have been rocking on the river bottom, doing well. There is scarcely a point along the Arkansas, in this district, that will not yield a prospect, and with the rocker, men have made from $3 to $12 per day.

South Park Items.—Miners are rapidly preparing for work. About Fairplay work will be on a larger scale than last year. Beaver Creek and Four-Mile will also be worked extensively. Dan. McDaughlin has started one sluice on new ground, which he thinks will pay well.

California Gulch.—The Pilot and the Five-Twenty lodes have already proved themselves equal to the best in the country. The last prospect from the Pilot gave 16 pennyweights of gold from a double-handfull of dirt. The rich streak is from four inches to three feet wide.

James' Creek.—The correspondent of the *Pioneer* says: Mr. Tomlinson is running an arastra at Jamestown, and his last clean-up, from less than one-fourth of a cord of rock, gave a yield of 27 dwts. of gold. Mallory and Strock are also each running arastras, and taking out from $75 to $200 per cord. J. Virden is building two arastras. Mr. Bachelor is having a wheel built to run eight more. Three boys have discovered and opened a silver lode, by sinking on it a shaft 30 feet deep. Neither of the boys is over 15 years old.

IDAHO.

The Idaho City *World* of May 13th, gives full notes of a recent tour of the "Basin." We quote here and there: All the way up Elk Creek, on both sides of Gold Hill, and in the bed of the creek, which is being stripped of its 20 or 30 feet of tailings and worked clear to the bed rock by Chinamen, mining is going on day and night, by hydraulics, sluicing, ground sluicing and drifting, and with good pay. Up Spanish Gulch, and in Bahoon Gulch, we saw miners making preparations for the short but profitable mining season which the water from the ditch of Camphell & Thatcher affords.

Centreville.—Those who had made clean-ups found their claims rich as ever, and contrary to expectations in March, there is promised a season of unusual length and ample water.

Pioneer.—This is still a good mining camp. We were shown several hundred pounds of ore from the Duncan mine in Charlotte Gulch, four miles from Pioneer. Assays have yielded, of gold, from $27 to over $1,000 per ton, and of silver from $40 to $180 per ton. The mine has two tunnels, one 187, and the other 450 feet. About 500 tons of ore is ready for crushing, and it can be delivered at the dump at a cost not to exceed $2 per ton.

Placerville.—From the town can be seen, within the area of less than a mile, 20 hydraulics, with full heads. The trouble which existed early in the season about water, was settled, and now the ditches are all owned by Devine, Ellis, Crowley & Co., who also own extensive claims on Granite Creek.

Granite Creek.—The claims on both sides are busy day and night. The great bed-rock flume, which belongs to four separate companies, and extend for nearly a mile down the creek, are also busily worked, and not an idle man did we see in the camp. So far, the miners had not made any clean ups, and most of them will not for two or three weeks yet, and then money will be plenty. Work on the Gold Hill Quartz Mine will be resumed in a few weeks. An extension of the same ledge prospects richly.

Ida Elmore.—Owyhee *Avalanche*, May 15th: The main shaft is down 250 feet.

The vein is about 3 ½ feet wide, containing ore as rich as has ever been extracted from this mine. There is a level of 140 feet opened ready for stoping, which will enable the mine to produce from 25 to 30 tons per day for some time. There is quite a pile of ore at the hoisting works.

GOLDEN CHARIOT.—The principal shaft has attained a depth of 280 feet, the ledge averaging from two to three feet, composed of very rich ore. There are 400 tons of quartz in the ore house.

SILVER CHORD.—The main shaft is 132 feet deep. The ledge averages now 2 ½ to 3½ feet in width, and the ore excellent.

WAR EAGLE MINES.—*Tidal Wave*, May 18th: The Baxter main shaft is now down 180 feet, and the company are making arrangements to sink 100 feet further immediately. They have large quantities of stoping ground in sight which they will work out as soon as possible....The Golden Chariot advertises for proposals to sink the main shaft 25 feet each way on the third level.....The Silver Chord continues to develop splendidly. The shaft is 140 feet deep and exhibits a good paying ledge all the way down....Col. Fogus is working the Peck & Porter with 12 men....The Cordroy is proving very rich. About 200 tons of ore on the dump is said to be equal to that of the Golden Chariot....It is expected that the Poorman shaft will be down by the 12th of June, deep enough for the contemplated new levels.

MONTANA.

GOLD CREEK.—Helena *Post*, May 7th: The excitement has subsided. The company has concluded to sell water at the old price, and the miners have all gone to work.

REYNOLD'S CITY.—The miners are hard at work, and the new gold is beginning to circulate.

BLACKFOOT.—Every one is busily at work, and the mining prospects are cheering.

Same of 14th: Taylor, Thompson & Co. have commenced work upon their claim and are running day and night. They have added a new engine and much improved machinery to the apparatus for hoisting and elueing.

LINCOLN GULCH.—Perry thinks that there will be more taken out this summer than ever before. The supply of water is abundant.

CONFEDERATE.—Bedrock flumes are in full blast and are all doing well. The flumes of King & Gillette, Sherwood & Co., and Thomas & Co., all have the most flattering prospects.

DEER LODGE ITEMS.—From the *Independent* we learn that the miners in Bear Guleh are hus y, and the mines yield richly. ....The miners of Silver Bow are commencing work....Some specimens of rock from the Tiger and Day lodes, Moore Creek District, are said to be unusually fine, containing one-half silver. It is said that the company have some 200 tons out. It is estimated that this rock will yield about $150 per ton.

NEVADA.

REESE RIVER.

MANHATTAN BULLION OVERLAND.—Austin *Reveille*, May 15th: This morning Mr. Curtis, Supt. of the Manhattan, shipped overland to New York 55 bars of silver bullion, weighing 4,747 pounds, valued at $70,739.80. This is the third considerable shipment of Bullion from this city overland to the Atlantic.

WASHOE.

IMPERIAL-EMPIRE. — *Enterprise*, 18th: The Imperial and Empire companies are now sinking their new shaft deeper. The sump is cleaned out and the shaft put in order for the purpose. The shaft is 1,104 feet deep, and the bottom of it is just cutting the east clay wall of the old Comstock. As the known dip of the ledge—45 degrees—is maintained at that point, it will take at least 200 feet of perpendicular sinking to reach the west wall. Within that distance some good bodies of ore must certainly be encountered, and most probably that demonstrated to exist at the lower levels of the Yellow Jacket, which tends in that direction. It is the best move they have made for months, and the only regret is that they did not do it sooner.

SIERRA NEVADA.—The Sierra Nevada Mining Company are taking out a large amount of paying ore, and the mine is looking as well as ever.

OCCIDENTAL.—Same of 19th: There was a rumor yesterday that a cave had occurred in this mine which did considerable damage. The fact is that the cave occurred in worked out ground, and at a point where the company cut out all the pillars of ore with the intention of allowing it to come down.

OPAL.—Work has been resumed on the old Opal mine, in Flowery, with flattering prospects. The ore is similar to that in the Lady Bryan. This mine created a sensation in 1863.

NOVEL BLASTING.—20th: During the past three days, a series of experiments in blasting have been made in the Sierra Nevada mine. Holes were sunk to the depth of 12 or 15 feet, and a light charge of giant powder, without tamping, placed in the bottom, on exploding which a large basin was formed—the giant powder acting with its greatest force downwards when no tamping is used. A keg of common blasting powder was then poured down, and the hole tightly tamped with sand. Charges thus put in did immense execution, throwing out tons upon tons of ore. General Van Bokkelen informs us that much of the rock thrown out was exceedingly rich in gold, and that he picked up some pieces filled with beautiful specimens of crystallized gold.

THE DISABLED MINES IN GOLD HILL.—*News*, 22d: The Yellow Jacket is working as usual, with about half its former force. The Kentuck is hoisting ore for the supply of the Sunderland mill. No ore comes from the Crown Point as yet. They are busy to-day putting in a sort of wooden box air-pipe about a foot square, leading from the 900 foot level of the Yellow Jacket through the Crown Point mine, in order to give the Yellow Jacket a good draft of air, and yet not allow a circulation of it up through the workings of the Crown Point or Kentuck, where there may possibly be some fire still burning.

STILL BURNING.—Same of 28th: The fire was discovered to be still burning at the 800-foot level of the Kentuck and Crown Point, and, the gas and smoke increasing, it was decided to close the fire in and let it have its own time. Accordingly from the 800-foot level up to the surface all the stations were tightly blocked up in the vicinity of the Crown point shaft. The fire will now be kept shut in until fully extinguished, if it takes a year. Both the Yellow Jacket and the Kentuck are sending out ore—the Kentuck from the upper levels. Drifting east for the ledge is being prosecuted, at both the 1,000 and the 1,100 levels of the Crown Point, beneath any possibility of fire.

OREGON.

WILLOW CREEK MINES.—The *Herald* learns that times are dull, but the ditch from Burnt River will be completed in a short time. There appears to be no doubt that the diggings are very rich. The scarcity of rain will not give as much water as is desired, yet will furnish enough for about 1,000 men.

CHINA.

SIX WEEKS IN SHANTUNG—COAL.—Mr. Markham, British Consul, accompanied by Messrs. Williamson & Wilson, says a Chefoo writer of April 18th, in the Shanghai *News Letter*, have been making a six weeks' tour through the Shantung province. Mr. M. obtained much valuable information regarding the mineral and other products. He found a Shanse merchant working coal mines in the Poshan Valley, who, if left alone by the Mandarins, would be able to lay down coals in Chefoo as low as $4 per ton. Large quantities are being extracted for local consumption from the Wei-hsien and Poshan Valleys; but the taxes are so ruinous that a prohibition is thereby put upon its conveyance to Chefoo. The Imperial tax is, however, light, and the first cost of the coal is but 60 cash per 100 catties, at the pit's mouth.

JAPAN.

COAL.—The Yesso coal mines, though blocked up by snow for some time past, are in a fair way for opening soon. The superintending engineer, Mr. Erasmus H. M. Gower, has been in Yokahama during the winter, and pending troubles at the north, leaving Mr. Scott, late engineer at the steam saw mills of Hakodadi, in charge of the works; and notwithstanding the many present difficulties in the way, all the plans are being ably carried out for their successful operation.

TO KEEP A STOVE BRIGHT.—Make a weak alum water, and mix your "British Lustre" with it; put two spoonsful to a gill of alum water; let the stove be cold; brush it with the mixture; then take a dry brush and lustre and rub the stove until dry. Should any parts, before polishing, become dry so as to look gray, moisten with a wet brush and proceed as before. By two applications a year it can be kept as bright as a coach body.

REMEDY FOR THE TOOTHACHE.—Toothache, according to the London *Lancet*, can be cured by the following preparation of carbolic acid: To one drachm of collodium add two drachms of Calvert's carbolic acid. A gelatinous mass is precipitated, small portions which, inserted in the cavity of an aching tooth, invariably give immediate relief.

White Pine Summary.

ITEMS OF PROGRESS.—The *News*, 14th: The Agency of the Bank of California yesterday shipped eight bars of bullion, valued at $9,400, from ores from the Consolidated Chloride Flat Company's mine, crushed at Shaw & Felton's mill. By the first of June the company will have in operation their own mill of 24-stamps, one mile and a half from Hamilton. A fine body of ore has been struck in the Montauk. Assays range as high as $100 to the ton.

The West Point is taking out rich chlorides....The Base Metal Range is again attracting attention....The Kohler Mill commenced on ore from Aurora Consolidated on the 17th....The Eberhardt is employing more hands....The Treasure Mill Company has struck a fine supply of water in its tunnel. The mill of the company has started up on custom ore....Bullion Hill, north end of Base Metal Range, shows fine ore

PATTERSON DISTRICT.—*News*, 17th: Mills are wanted. As an inducement Mr. Murphy comes to this city prepared to offer 300 tons of ore, which will be guaranteed to yield over $100 per ton, a suitable site and plenty of water, to any one who will immediately construct a 20-stamp mill in the district.

BULLION. — *Empire*, 18th: Shipped by Wells, Fargo & Co., from Hamilton, from Collins' mine, two bars bullion, weighing 63 pounds, and valued at $3,024; seven bars, valued at $7,923 72; two bars, valued at $,452 42. The last nine bars will go overland to New York.

Our agent, W. H. M., sends us the following notes from Treasure City, Nevada:

TREASURE CITY.—I started from here at an early hour for a tramp among the mines of this district. On my way up Main street, I met an old friend, Mr. C. Ells, who accompanied me to the Zubrick mine, located on Bromide Flat, where I found about 200 tons of second-class milling ore piled upon the dump. Descending the shaft, I found myself among the miners breaking out the ore. I saw a large quantity of first-class ore stowed away in the drifts, which they would not raise to the surface on account of the great loss incurred there by "speeimen hunters." At a depth of 20 feet could see a plenty of ore in place, which would assay from $200 to $1,000 per ton. The ledge or layer is about eight feet thick, so far, and no bottom yet. Some of this ore may be seen at the *Alta* office, in your city. This is a very valuable mine, and well worth a visit.

We next passed on to the Grinnell ledge, and went up on the side of the low hills of the Base Metal Range, on the road from Shermantown to Treasure City. Here we saw a very fine base metal mine, standing almost perpendicular, and 12 feet wide, with well defined walls. It was located Dec. 25th, and the owners are well pleased with their Christmas gift. The ore is of a fine quality, assaying from $100 to $900 per ton. This is thought to be a valuable mine, and has been stripped down some 12 or 15 feet from the top. Well informed persons express the opinion, from experiments already made, that the ores of the Base Metal Range will readily yield to smelting processes, and that the mines of that district will soon prove as valuable as they certainly are extensive.

We next called at the Schwer ledge, situated on the crest of the hill south of the Big California mine. The company has gone down 21 feet and have good prospects. The ore is specked with antimonial silver. They propose to resume work at an early day.

We came next to the Matilda mine, where we found two men at work. They were down about 15 feet, with good indications of chloride.

The prospects hereabout appear to me encouraging. The fact of the existence of good mines here will soon be proven. Men are also almost daily going out into distant sections, and the feeling is quite universal that good mines will be found all the way to the Colorado River.

The snow has all gone from the hills about Treasure City, and is fast disappearing from White Pine Mountain also. To some this is a welcome fact, while others, who have hitherto melted snow for cooking and drinking purposes, and now have to buy water from Hamilton at eight cents per gallon, are not so well pleased. The necessaries of life are very high—meals and bunks, $1; lumber, $225 per M on the hill, and $200 to $212 at Hamilton. Quite a number of wooden shanties are going up in the three towns, and now and then a stone house.

Good reports are received from Grant, Patterson, Snake Mountain, etc. On this flat, at Bromide, Pegonip and elsewhere in this vicinity, holders claim six and eight hundred feet on the ledge. The oldest holder or location holds the ledge, and if they can run into the working of another, within the bounds of their claim, all right, and the first locators take the shaft. It often happens that a party will "set to" some twenty feet or so from a paying claim, go down with a shaft and work with a will getting out ore, until the original locators run a drift to them upon the vein, thus proving priority of claim.

PATTERSON.—A gentleman from this district, located about 85 miles east of Treasure Hill, assures me that Patterson will soon become a prominent mining camp. It is bountifully supplied with wood, water and well defined ledges, yielding by mill process from $150 to $200 to the ton. It is surrounded by well watered valleys suitable for agricultural purposes. It already boasts of several stores, a blacksmith shop, etc. As there is an abundance of ore, the miners offer good inducements to capitalists and millmen.

THE ALEXANDER MINE.—On my way to Shermantown I visited the above named mine, with the value of which I was so much impressed, that I feel justified in giving you a brief notice of the same. After passing down the grade from the Eberhardt, and coming to the point immediately below the Seymour, I reached the Rosebud, which you have already noticed, and which I did not stop to examine, but kept on down the hill about 400 yards, where I reached the Alexander mine, located on the point of the ridge running directly down from the west end of Pegonip Flat, and a few hundred feet below the rich McCarthy, and Seymour or Hearst claims. It appears to be a well defined ledge, and it has been traced along the sidehill some little distance, exposing good looking ore. As far as they have gone in on the ledge—about ten feet in one place—taking out about 12 or 15 tons of ore, well filled with chlorides and argentiferous galena, the ledge has increased in thickness from a few inches to between three and four feet. It has a dip into the hill of about 30 degrees; several assays from near the surface have yielded from $65 to $190 per ton. The location seems to be a good one for a permanent mine, as it dips into the hill toward Chloride and Bromide Flats, and is but a few hundred yards below those celebrated localities. The owners think they have a "good thing," and more especially as there are no conflicting titles, which is an important item in this district.

Leaving the Alexander mine, I went down the grade about a mile, and nearly opposite the Lime Kiln found the "Samuel Franklin" Ledge, a hold, well defined mine, of apparently broken quartz, filled with mineral matter—showing chloride and galena quite freely. It has every appearance of being a true fisure vein, as it is nearly perpendicular with both walls clearly defined, and where the mine is opened, eight feet apart. The vein can be traced along the hill, each way for several hundred feet. I was informed that assays from this mine ran from $75 to $225 per ton in silver. The location is the oldest in the vicinity, and consequently the owners feel that they have a sure title, with a fair assurance of prospective fortune.

THE PHOSPHORIC LIGHT.—Mr. Winstanley obtained a powerful light for photographic purposes in the following manner. A quantity of phosphorus was placed in a suitable vessel; through this vessel a current of common coal gas was passed, the direction of the stream being so regulated that it could pass over the phosphorus and then escape through a jet fitted for the purpose. When the phosphorus, heated, commences to volatilize, the luminosity of the flame greatly increases, owing to the combustion of the phosphorus vapor, and fumes of phosphoric acid are produced.

Mr. Winstanley pointed out that the intensity of the light could be greatly augmented by feeding the phosphoric flame with pure oxygen. When this was done, "The brightness of the flame was enormously augmented, and the ample room in which the experiment was conducted became brilliantly illuminated."

THERE are more papers published in San Francisco, with its 130,000 inhabitants, than there is in London, with its 3,000,000 souls. It seems remarkable, but it is nevertheless true.

Saturday Morning, May 29, 1869.

Notices to Correspondents.

Thistle.—The latest account of the Kildonan gold diggings of Sutherlandshire, Scotland, is to the effect that they scarcely yield on an average a Highland laborer's ordinary rate of day's wages. A fresh rush of adventurers had taken place, owing to the cessation of the winter fishing on the Caithness coast, the newcomers bringing with them their boats, making therewith temporary dwellings, the upper parts being formed of boats laid keel upwards, and the walls composed of heather interwoven between the supporting posts. The highest figure realized by the luckiest seeker is said to have been $50 in one week. As of general scientific interest, we clip the following from a late English paper: "An explorer announces that during his investigation into the auriferous nature of Scotch quartz, he has discovered small quantities of platinum associated with the gold there existing. The platinum exists in the form of small scales, resembling silver, but they are not magnetic.

Archæologist.—No remains of man have so far been found of an antiquity equal to what is denominated the glacial period. The marked changes of temperature between the older and newer pliocene strata has so far been most strikingly exemplified in the series of beds known as the Norwich crag, in England, the lower series containing fossils indicating a warmer climate than that now existing in England. The next following beds exhibit fossils of an Arctic character, the cold increasing gradually in intensity, with some oscillations into the superior beds, until it reached its maximum in what has been called the glacial period. The marine fauna of the period last alluded to, contains, both in Ireland and Scotland, species of mollusca now living in Greenland and other seas far north of the areas where their remains are found in a fossil state.

One that is Curious, Benicia—Wishes to know if it has ever been ascertained in what consists the difference of effluvial power between the white and dark-skinned races. Dr. Starch, of Edinburgh, published a work on the emission and absorption of odors, which contained the result of some curious experiments. According to the Doctor's theory, the tissues of animal substances possess a greater affinity for odors than vegetable ones; also, the absorption of odors by outward tissues follows the same law that obtains respecting the absorption of caloric, that is, black tissues absorb the most odor, and this absorbing power diminishes as the color becomes lighter, white tissues being those which absorb odor the least.

Not Dead Yet.—A paragraph has been going the rounds to the effect that Capt. Ericsson died recently of hydrophobia. The statement is not true; the man referred to in the original paragraph was named Eckerson. We shall hear more of the solar engines yet.

A Glance Across the Pacific.

One of the explorers of Central Asia under British East Indian auspices, Robert Von Schlagintweit, has arrived in this city by the Pacific Railroad, and is expected to lecture on the subject of his researches in that country in German, at least before one of the German clubs, perhaps if not in English. We need scarcely to remark the self-evident truth that Asia and the mystery of things Asiatic, the ethnological and physiographical wonders of that cradle of the Caucassian race, possess a peculiarly fresh and direct interest to Californians, who view them not as in the Orient, but "westward," and due in the "star of empire's" course; a more immediate interest, because looking to the future, than they can possess to the purely philosophical-minded philologians of Europe, or to those who approach Asia commercially through a hazy sea of preconceived notions dating back one thousand years. There are not wanting, in our midst, those whose reading and application of ideas to every-day life, embraces the field of the oriental exploration and publication societies. To us there is a new, and in general a practical bearing to every question touching upon the capabilities, the resources, and the moral influences of our *vis-a-vis*, which cannot fail to give a special zest to all published matter, and to lectures on that subject.

From the *Friend of India*, of Jan. 21st, we learn of the existence of great ancient gold fields in Central Asia, that were recently visited and described by Captain Montgomery with the assistance of several natives, all in disguise. Having crossed the Himalaya and traveled northward beyond the Indus into the elevated regions of Western Thibet, the party encountered a heavy fall of snow in midsummer, and in the district of Thok Jalung they came upon a camp of gold diggers. This is the principal gold field in Western Thibet, being situated on a desolate plain, 16,000 feet above the sea. The Asiatic gold diggers were born and lived, in these elevated treeless tracts, pursuing gold mining as their permanent occupation. Nuggets of several pounds weight are spoken of.

We know that the Russians have been quarreling with the Chinese about gold fields not far from these regions—situated between Aksu and Ili, in Western China—and the fact becomes apparent that numerous portions of Central Asia, from the middle of Asiatic Russia, (the paying silver mines which have been long and extensively worked by the Muscovites in the Altai Mountains,) to Central China, there is an important auriferous region worthy the attention of, if not of our restless miners, at least of those Americans who have a fancy for building railroads for the Czar, or who would undertake a job of the same kind for the Emperor of China. With labor at the Asiatic standard, gold mines, iron mines, and coal mines now considered valueless—by us from scarcity of economical labor, by Asiatics from scarcity of available skill—might obviously be worked, by a little well-directed capital, to an immense profit; while success in any such enterprise could not fail to result soon in the most important and decided advance steps recorded of any race or races in the history of civilization.

We of the West are just learning to talk with Asia, and to be understood. We find our Chinese population to be the best patrons of our public conveyances, of express offices, and of the telegraph. While Americans are holding, and operating under Chinese telegraph franchises, and running Chinese river steamers, introducing China *pro forma* to Europe, we are encouraged to hope that the intelligence of the astute Prince Kung will not long be held in abeyance, to admit of much further conservatism or delay in his deciding in favor of the concession of inland residence to Europeans—a treaty question, the favorable settlement of which would at once remove all difficulties in the way of the great desiderata of inland trade, communication, mining, and transportation, and the denial of which constitutes our bar to progress in that direction and the real impediment to the advancement of China at the present time. American, Russian and English interests even in Central Asia have grown into a tangible fact, the importance of which is but faintly foreshadowed, it is true, yet it is unmistakably one of the new and striking phases of the "times."

Neglected Resources.

When two men are seen staring fixedly into the sky, there is very apt to be a crowd of the "intelligent public" gathered in a few minutes, staring hard in the same direction. This is the same characteristic of humanity in general that "Pro and Con" (our correspondent on another page) complains of in deprecating the tendency, amongst miners especially, to drop everything even of substantial prospects, under the influence of a new and overweening mining rush. Real estate, commerce, and manufacturing, produce daily examples of this human weakness, when it is weakness, the nature of which is two-fold: being too easily carried along by a current because one does not act habitually upon individual information and conviction; or a shrewd idea that where the crowd goes to buy, things must be cheap, yet lacking in that kind of judgment which tells us at the same time what makes the crowd go hither or thither. These are the business man's every-day note-takings; his safety, and rule of success in large undertakings, are his independence and self-confidence, based on a clear and thorough understanding of the whole matter in hand.

Mining with many is gambling; but with a large and growing class it is nothing of the kind. The times in these regions have changed, evidently, for stocks are not to-day every poor man's currency. Mines are classified into dividend and non-dividend paying. The amount of necessary risk in the undertaking of mining enterprises is becoming greatly reduced to those who are gifted with only an ordinary degree of common sense—a commodity incompatible, it must be remembered, with the idea of mining as entertained by that large class who take to it in the first place, or who pursue it, *imaginatively*. Mining "sharps," however, will always flourish; while mining experts will not fail to be estimated by the amount of money they can *save* a company, rather than for what they may spend.

The question of hard cash is, with most of the older and prospected districts, the real one. The margin perhaps is found very small, and the energy is not existing to overcome immediate but in many cases trifling difficulties, which alone prevent properties that are held at inconsiderable prices, from being recognized as worth their hundreds of thousands. Very frequently there is a metallurgical difficulty. But time, and a little more light from dear experience, regarding the features of different districts and the minerals constituting their ores, will teach us speedily enough what are the really favorable considerations that shall cause one district to rise, while another must fall into decay. To the practical miner or metallurgist information on economical and metallurgical points affords the key to comparisons which, in his way of looking at it, present a most attractive problem.

Without attempting here to state more fully the points which are destined to draw back attention to some of the older and well prospected districts, it is evident that there are many amongst those already partially developed which are at present greatly undervalued. Figures in proof of this are constantly appearing, of a positive character, and that "cannot lie." California offers, in its plentiful auriferous pyrites in the Sierra Nevada and its wonderful ancient gravel channels, an amount of neglected wealth quite unlimited, that is destined yet to be taken out; and there are not only Mammoth District, and Humboldt, and Idaho, referred to specially in this issue, but Owens River, Arizona, Durango, and the slopes of the Sierra Madre; all fields of brilliant promise in mining, while they present to the adventurer at the same time many fine opportunities for agricultural and engineering enterprises.

To do justice to these older districts at present would be impossible. Let us have more facts and figures for comparison, and we shall not be long in discovering where are located our neglected mineral resources.

Interior of Vancouver Island.

A late number of Petermann's *Geographische Mittheilungen* contains a very complete and interesting description of the interior of Vancouver Island, acquainting us with hitherto unexplored regions, and furnishing us with a fine map of the island and coast fiords, by Robert Brown, the leader of various government exploring parties between 1862 and 1866. The situation and geography of Vancouver Island are very peculiar; but, owing to the exceedingly dense forests and treacherous, savage Indians, all but a fraction on the southeast corner has remained an unexplored wilderness. The beautiful scenery and grand forests of the coast and of the interior become monotonous, even tiresome, and generally remain unappreciated on account of the difficulty of scrambling over the fallen logs, and through bushes and ferns, at no little risk of loss of road, detention, and starvation, the scarcity of game in general being the remark of all explorers, to their sorrow. The whole of Vancouver Island is covered by erratic blocks of gray syenite, which were brought, Mr. Brown thinks, from Alaska, by the great Northern Drift. The principal buildings of Victoria are built of stray Russian American material, which thus escaped belonging to the United States. Nothing is said about the age of the sedimentary rocks. According to another author whom Mr. Brown does not allude to, they are cretaceous at the southern end of the island. Plutonic rocks constitute some of the ridges of the interior.

The following is the literature mentioned: Grant, Description of V. I., Jour. R. Geog. Soc., XXVII; Donglas' Report of Canoe Exp. along the East Coast, Ih., XXIV; Hazlitt's Brit. Col. and V. I.; Forbes, Prize Essay on V. I.; Beojamin, Reise in den Staaten, etc.; Mayne, Four Years in Brit. Col.; Macfie, Brit. Col. and V. I.; Pemberton, Facts and Figures relating to V. I. and Brit. Col.; Harvey, do.; the Parliamentary Blue Books; Vancouver Pilot U. S. Coast Survey. The works of Kinahan Cornwalis and Fred. Whymper may be added; and Vancouver's Voyages contain a good deal about the island, but unaccountably describing it as intolerably dreary. J. K. Lord's "Naturalist in British Columbia and Vancouver Island," is a new book.

Iron, coal, nickel, copper, graphite, silver and gold have been discovered in a great number of localities.

The Death of George Gordon, whose very practical suggestions on earthquake architecture when general attention was directed to that subject in October last, procured him the chairmanship of the Chamber of Commerce Committee on Earthquake Topics—took place on May 22d, and called forth numerous highly laudatory notices of his career as a keen, thinking, public-spirited citizen. He was a native of Scotland, a forty-niner, an ingenious mechanic, and especially well informed upon, as well as identified with, various manufacturing enterprises.

Minerals—Geology.

Eastern Nevada Fossils.—So prolific and well-preserved are the fossils in the limestones and sandstones of Eastern Nevada, that a study of species becomes attractive. Some bivalves, (according to the description), taken from the Knickerbocker mine on Treasure Hill, and not petrified, retain their natural blue and green tints as freshly as if they had been picked up but yesterday on the sea shore. Not only the older formations—the Silurian and probably the Carboniferous,—are easily studied, but there are newer sandstones as late as the Cretaceous or Tertiary, which remain to be more definitely determined,—as further noticed under the proceedings at the last meeting of the Academy of Sciences.

Building Stone.—Owing to the high price of lumber in the Great Basin, stone building material is attracting attention. On the Union Pacific Railroad, between Laramie and Ogden, we are informed that stone work is no longer put into the bridges, because no quarries have been discovered of a durable material. The marly sandstones, constituting the rock formation of that entire country, speedily crumble away; accounting for castles and bastiles that are seen wherever cappings of harder rock have protected a turret from denudation. Even the Weber Cañon red sandstones are poor building material. West of Salt Lake there are found durable silicious sandstones, which answer well for furnace material, having been used successfully for that purpose since 1867, in cupola smelting furnaces at Stockton, near the western shores of the lake. Stone quarrying is already quite a business at Treasure City, two quarries being adjacent to the business portion of the town; but we are not informed whether it is limestone or sandstone, or a mixture of either with aluminous material, which makes the best stone for building. A celebrated metallurgist of Treasure City is said to have built a furnace of chloride ore, and smelted it all down with great success. For houses or banks, infusibility is not so important a consideration, and chloride may be used when, as on Treasure Hill, it is to be had cheaper than anything else. The Bank of California building in San Francisco is a bluish sandstone from Angel Island, resembling that of the New York *Times* building, or Nova Scotian freestone. Though stone is deemed somewhat objectionable in an earthquake country, it is quite safe when laid with good mortar, and is in no danger of being superseded, for solid walls, by any artificial substance. Facility of working, variety and beauty of color, and the tendency in many cases to harden after centuries of exposure,—like the filagree work in the cathedrals of Strasbourg and Cologne, which was very soft and friable in the quarry render sandstones generally preferred for building.

An Underground River in Nevada.—Mr. A. Rock reports that there is in the old Mormon cave in Patterson District, Nevada, the channel of a former stream, evidenced by plentiful deposits of wash gravel and pebbles, the course of which has been explored for a mile and a half, the air having been found pure, and the passage free and continuing open. The cave runs lengthwise under an east and west spur of the principal argentiferous mountain of Patterson District. Streams containing pebbles run through Mammoth Cave, Kentucky, and through the St. Louis cave, both of which are in limestone. The larger underground rivers of Florida, running for ten or fifteen miles in openings dissolved out between the more durable limestone strata, afford better examples of the possibilities and wonders of invisible underground water courses.

Iron.—In the "Mining Summary" will be found some particulars concerning a large deposit of nearly pure red oxide of iron in Calaveras County, having a silicious and aluminous gangue, favorable for smelting. Bog iron is found in large deposits above Cisco, on the Central Pacific Railroad; *chromic* iron in Monterey and Santa Clara and Butte counties. *Hematite* (specular iron) in very many localities in California; in Humboldt Valley, Nevada; on Williams' Fork, Arizona; in a huge iron mountain at Durango; on the coast of Mexico, a little south of Acapulco, etc.; near the east fork of Walker River, Nevada, in veins twenty feet thick. *Limonite* at Burn's Creek, Mariposa County, in solid blocks two to four feet thick; at Oswego, Oregon, etc. *Magnetite* in large beds, massive, in Sierra County; at the Cañada de las Uvas Los Angeles County, in a vein three feet thick, in limestone; in small veins near Weaverville, in beds at Crystal Springs, Neilsburg and Long Valley, near the Central Pacific Railroad, and in crystals, in the syenitic granite of the Great Basin, and almost everywhere. *Titanic* iron in seams in trap near Diamond Springs, El Dorado County. *Spathic* iron (carbonato) in deposits twenty miles from Salt Lake City. We have mentioned only a few of the localities that might be named. Mr. Bennett, in Ross Browne's Report, p. 219, gives much additional information.

G. V. Phillips, of Nevada City, mentions in the *Union* a 10-foot vein, without stating the ore which is most important, located three miles above Nevada, and makes the following estimates concerning reduction:

The ore can be mined at an expense of $2 per ton; charcoal can be made and delivered at the mine for $8 per ton; a furnace capable of smelting five tons of metal will require the employment of ten persons; freight on pigs delivered in Grass Valley and Nevada, $3 per ton. The annual consumption of pig iron (for castings mainly) in these two towns (containing three foundries), is variously estimated at from 1,000 to 3,000 tons. The average cost of pig iron laid down here is $60 per ton.

Ten tons of ore will produce (for a day's work) five tons of metal worth in this market			$300.00
The rule is one and a half tons of charcoal for the ton of metal			
Five tons of metal will require 7½ tons of charcoal at	$8.00	$60.00	
Expense of mining ore, 10 tons at	2.00	20.00	
Ten smelters (per day)	4.00	40.00	
Freight to Grass Valley and Nevada, 5 tons of metal at	3.00	15.00	135.00
			$165.00

Then, taking the lowest estimate of the amount required to supply our local market per annum, viz.: 1,000 tons, at $33 per ton profit, and we have quite an inviting business for some one with a little capital to engage in.

Contributions for our Cabinet.

No. 402.—*Earthy carbonate of magnesia*, without grit, very white, and pure, found in nests and pockets in seams of steatite—from which it appears to have been derived by the action of carbonic acid waters—in the upper part of Napa County. It contains from 10 to 20 per cent. of lime, and other ingredients. As the mineral in this form is supposed to be more favorable for chemical manufacturers' uses than the hard crystallized magnesite, and as the deposits are extensive, requiring only the construction of a road up a narrow mountain ravine, the owners of the claim anticipate profits from shipping it to Philadelphia, or Liverpool, as ballast. Presented by H. G. Wetmore, Fairfield Solano County.

No. 403.—*Actinolite*, being a fragment of a large boulder. From the Diablo range east of San José,—with Nos. 404-5-6 following, all presented by W. F. Stewart, of San José.

No. 404.—Stratum of green earth, overlying limestone. It seems to be of chloritic material,—a decomposed or earthy mariposite.

No. 405.—Mariposite.

No. 406.—Clayey stratum or vein about five feet in thickness, containing very plentifully a dark coloring substance which has the appearance of graphite. It is possible that by concentration this might be found economically valuable.

No. 407.—Hematite, red tin, and opalline quartz; deposited over each other in the order named in grape clusters, showing beautifully the chemical order and manner of deposit, heretofore referred to in connection with Durango tin. Generally, when tin is not present, in the Durango ore channels, silica deposits itself, as is here shown, later than tin. Durango. J. H. C. Bennett.

No. 408.—*Argentiferous limonite*, or brown iron ore; a remarkable occurrence of silver, assaying up to $2,000 per ton and over, which is quite common, and has been extensively mined on the Whitcomb ledge, near Oreana, Humboldt County. The precious metal seems to be diffused in the iron in the form of chloride and bromo-chloride; hydrated peroxide of iron resembling red chalk constituting more than 50 per cent. of the specimen. Its brown color darkens on exposure to air and light, the pieces being always of a fresher and brighter color when they are taken from the mine. Our specimen is from the Grant mine, and contains also chloride of a greater purity intermixed, together with stains of malachite. Difficulty in amalgamating this argentiferous limonite caused the property to be held—as many other mines are yet held—far below the assay value, and to be left comparatively undeveloped from want of the proper metallurgical skill, or the necessary money-turning "trick." Presented by Guido Kustel.

No. 409.—*Chloride of silver* in lime and calcspar gangue, from the Juno ledge, Battle Mountain District, Nevada. The chloride is generally of a greenish tinge, in small streaks, and zones; considerable iron—also argentiferous limonite—is intermixed. As crushed, after sorting, the ore assays from $75 to $200, and $25 and upwards being gold. Some of the ores in the northern or limestone belt of the district, are identical mineralogically and in gangue, as well as in appearance, with the White Pine, or other lime chloride ores of Eastern Nevada. The Juno ledge is a new development, being situated on Moutrose Hill, and running parallel with the St. Helena and Moutrose ledges. Country rock, quartzite. Presented by J. H. Culver.

No. 410.—*Vein formation.* Two vein pieces from the bottom of the new 80-foot shaft of the Heslip mine, Jamestown, Tuolumne County, showing gold and pyrites thickly and evenly spangled through quartz. It is of interest as illustrative of gold vein geology. Bands or strata of a rich dark-colored, and a light and apparently nearly barren quartz, succeed each other, but while the latter are thin and contain occasional very rich spots of native gold, the former are massive and contain only iron sulphurets, showing, however, a very curious striation and cleavage, or tendency to stratification, at right angles to the two kinds of quartz planes. At a little distance the darker kind looks like a bleached chloritic slate, which has been fractured in white streaks across its grain, but on closer examination it is found to be all silica. These schistose bands appear to have been silicified from channels indicated by the light quartz. It seems that the schistose rock served as a reagent favorable for the deposition of sulphurets, while the purer silicic acid is more likely to contain its gold in free form.

No. 411.—*Fossils*, mollusks and corals, from White Pine District, near the Von Schmidt water reservoir, four miles from Hamilton will be noticed more fully hereafter, in connection with fossils from Eastern Nevada. Presented by G. A. Loyd.

Earthquake Pamphlet.—Thos. Rowlandson, F. G. S. L., and recently Secretary of the San Francisco Earthquake Committee, has issued a treatise in pamphlet form, evincing much research and valuable information, on Earthquake Dynamics; Earthquake Waves; Sound that attends Shocks; Palliatives, Suggestions and Conclusions.

We incline to the opinion that the work contains much valuable information, and is well worth the fifty cents for which it is forwarded, postage paid, by Dewey & Co., of the Mining and Scientific Press, San Francisco. *Stockton Independent, May 22.*

Continental Life Insurance Company, 203 Montgomery street, corner of Pine.

The Earth as Seen from the Moon.

Those who dwell upon the center of the lunar disk—if there are any inhabitants there—behold the earth, like a vast globe, directly over their heads, thirteen times larger than the moon appears to us, and fixed eternally in the starry sky. Those who live near what appears to us as the borders of the moon, see the earth proportionally removed from the center of their heavens until those upon the extreme border behold the vast globe apparently resting upon the tops of their lofty mountains. A little further on, and turning the edge of the disk, the earth is lost to their sight entirely. The earth presents to the moon all the phases of the moon to us—when it is new moon to us, it is full earth to them. It sheds upon the moon thirteen times as much light as that orb does upon us. By its daily revolution, every portion of the earth is gradually brought to the view of the lunarians once in each twenty-four hours; while in return, the moon to us presents only its constant half. The vast ocean expanse of the earth must give it a greenish tint; the land appearing of a dark brown. The light received is of an "ashy paleness," and not bright like the sun. Portions of the earth covered by clouds have a floculent look, which must give a constant variable appearance to the earth's disk.

South African Mines.—A luxurious correspondent of the *Alta* from D'Urban City Natal, in the South African gold regions, furnishes us with information how to reach that defunct El Dorado, estimating the cost as follows:

	1st class.	2d class.
Passage from San Francisco to New York	$1,000	$300
Expenses in New York	20	10
Passage to Liverpool	300	100
Passage to London, cab hire, etc	30	10
Expenses in London	100	25
Outfit of arms, ammunition, etc	300	100
Clothing, boots and shoes	200	100
Mining implements, cooking utensils	75	50
Wagon and tents	225	150
Books	25	10
Passage to Natal	1,000	350
Freight to Natal	100	50
Oxen, for twelve or six	250	or 125
Taxes, presents to natives, etc	100	25
Provisions for six months	100	75
Total	$3,825	$1,460

The mines on Tatin River are now called the "Southern Mines;" those 100 miles beyond are the "Northern Mines," and are held by a Kaffir chief. He says there are at present 280 men at work in the mines, but it is not positively known whether they are making it pay or not. There were seventeen vessels in port at D'Urban. By some of them there came 150 Australian gold diggers, who seem to be very much dissatisfied.

The Practical Painter.—We have received the first number of a periodical, which, as its name indicates, is devoted to the interests of the fraternity of painters. It is one of the hopeful signs of the times that there seems to be a growing inclination among the practical working men in all branches of industry, to establish and support periodical publications, which shall have for their object the elevation and improvement of the members of their respective professions, by disseminating among them useful information, and cheering them with words of encouragement. We are pleased to see that the practical painters are to have their organ, among others, and we trust that generous and appreciative body of working men will not be slow in extending a helping hand in aid of so praiseworthy an undertaking. The "Practical Painter" is published monthly for fifty cents per annum, at 37 Park Row, New York city, by Willis, McDonald & Co. The number before us is a small, but neatly printed folio, well filled with matter such as should be brought to the notice of every painter.

Rufus L. B. Clarke, recently appointed Examiner-in-Chief in the Patent Office, is a brother of "Grace Greenwood." He practiced law and editing, and is reputed to be a gentleman of ability.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight: without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz milling, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.
San Francisco, May 1, 1868. 18v16tf

Globe Iron Works,

STOCKTON, CAL.

KEEP & BARGION,

MANUFACTURERS OF

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers,

High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.
13v13tf

CALIFORNIA BRASS FOUNDRY.

No. 125 First street, opposite Minna,
SAN FRANCISCO.

ALL KINDS of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch.

☞ PRICES MODERATE. ☜

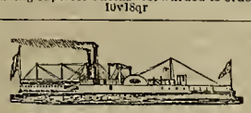
FOUNDRY FACINGS.

BENJAMIN ELLIOT,

No. 483 Brannan street.....San Francisco,

Manufacturer Foundry Facings constantly, from choice coals. Bituminous, packed in tight sacks. Anthracite and Charcoal ground together or separate, packed in whole or half barrels. Black Lead, Coke and Soapstone ground to order. Foundrymen located far from choice material, can rely on having superior Facings forwarded to order.
10v16qr



JAMES MACKEN,

COPPERSMITH.

226 Fremont st., bet. Howard & Folsom.

All kinds of COPPER WORK done to order in the best manner. Particular attention paid to Steamboat, Sugar House and Distillery work.

Repairing promptly and neatly attended to.
13v11

Miners' Foundry

—AND—

MACHINE WORKS

Nos. 245 to 255 First Street,

San Francisco.

HOWLAND, ANGELL & CO.,

PROPRIETORS,

Manufacturers of Machinery for

QUARTZ MILLS.	FLOUR MILLS,
SAW MILLS,	SUGAR MILLS,
POWDER MILLS,	PAPER MILLS

Steam Engines of all Kinds,
Amalgamators of all Kinds.

MINING PUMPS, HOISTING WORKS,
OIL WELL TOOLS, ROCK BREAKERS,

—AND—

Machinery and Castings of all kinds, either of Iron or Brass.

Boilers and Sheet Iron Work in all its Branches.

Shoes and Dies of White Iron, manufactured for and imported by us expressly for this purpose, and will last 25 per cent. longer than any other made on this coast.

Russia Iron Screens, of any degree of fineness. We are the only manufacturers on this coast of the

HICKS ENGINE,

The most compact, simple in construction, and durable, of any Engine in use.

Foundry and Iron Works.

HINCKLEY & CO.,

MANUFACTURERS OF

STEAM ENGINES,

Quartz, Flour and Saw Mills,

Hayes' Improved Steam Pump, Brodie's Improved Crusher, Mining Pumps, Amalgamators, and all kinds of Machinery.

N. E. corner of Tehama and Fremont streets, above Howard street, San Francisco. 3-qy

McAFEE, SPIERS & CO.,

BOILER MAKERS

AND GENERAL MACHINISTS,

Howard st, between Fremont and Beale, San Francisco.

Fine or Tubular Boilers, with plain circular or spiral courses. Upright Fine or Tubular Boilers, Locomotive and and Marine Boilers, and Wrought Iron Tanks of every description.

Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, height of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.

Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.

To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.

Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care.

To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas but not the practical experience necessary to put the same in form, by making Drawings of their Inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their inventions. 1v16tf

Written for the Mining and Scientific Press.

Exploration vs. Honest Mining.

OUR FIELDS OF TANGIBLE BUT NEGLECTED RESOURCES.

EDITORS PRESS:—Nevada has been designated the "Silver State" of the United States of America, and without controversy, justly so. There can be no doubt of its abounding wealth—superabounding as regards the present day. It did not remain for the discovery of White Pine to give color and solidity to such an opinion, for such an opinion existed prior to the discovery of that famous district, and will not cease to be entertained when that shall have ceased to agitate from center to circumference a world of enthusiasts.

It would be a bootless undertaking at any time to attempt to stem the tide of excitement produced in these days by a gold or silver mania. Something gives rise to it; seemingly a fortuitous concourse of events. It does not seem to be the result of an elaborate scheme of any man or organization of men, yet there is the concurrence of a sufficient number to beget motion. The tide sets in and rolls on, increasing in volume and momentum until fanned by the breezes of popular enthusiam it becomes irresistible, and so it continues until checked by the demonstration, that the mountain in labor has produced only a mouse.

It is not my design to underrate White Pine, or any other district, but merely to say that the elevation of that or any other district to an altitude considerably above its merits, reacts prejudicially to the whole system of mining.

It is a question which has often suggested itself to my mind: Are not ores of the same value equally valuable in any other part of the State—all other things being equal—as they are there? and if not, why not? Mining on 'change and mining in the mines and of the mines, are not unfrequently productive of results diametrically opposed to each other.

I freely admit that the value of mines is in proportion to the chances of large realizations, but I contend that that fact applies more favorably, prospectively, to districts which are now neglected, than to those which constitute at present the popular class. It has been almost invariably found that where an extraordinarily rich deposit of ores occur, the chances of finding a second are somewhat remote, and that where large quantities, comparatively, of the chlorides of silver are found in disrupted rocks near the surface, their continuity in depth is always a matter of grave suspicion, until demonstrated to the contrary, which unfortunately is not very often the case.

It is unquestionably too premature, to elevate from mere profile, any one district of Eastern Nevada head and shoulders above the rest, to say nothing of the danger of its resultant consequences, which are almost certain to be prejudicial to mining generally.

There can be but little if any doubt that the things of to-day are no more than the airy precursors, the A B Cs, the ephemerals of what is to succeed them and constitute the sources of metallic wealth for a succession of ages. It is a trait seriously affecting the operations of the present mining generation, that the purely sensational—to the utter exclusion of the substantially indicated enterprises—monopolize attention; an *ignis fatuus* being more highly esteemed because of the suddenness of its emission and its brilliancy of light, than are stars of the first magnitude, which never fail to shed their mild and beneficent influences for all time.

The vanity of becoming rich at a bound, it would seem, has hurled reason from her throne, and laid an embargo on common sense. The nature and principles of mining are ignored, and the contemptible dogma is imperiously substituted, that ledges which do not crop richly to the surface and continue to yield in unbroken line ores of remunerative quality in depth, are of necessity, therefore, decidedly valueless. I need scarcely say that all ledges of this class throughout the extensive wilds of this State, will soon be invested; and that if all new districts yet to be organized are dealt with and dismissed in a similar summary

manner as those hitherto discovered, the present generation will, with bnt one or two exceptions at most—I refer tn the Comstock lode—have accomplished the extraordinary feat of exhausting tho entire metallic wealth of Nevada.

That we live in a fast age, I know; but I can never indorse a progress that is attained but at the expense of skipping ninety-nine hundredths of all legitimato work. If all the other States of the Union are manipulated as this is being done, we shall soon be reduced to the distress of Alexander, and weep that there is not another world to range over and pillage. More than 40,000 sqnare miles of this State havo been "done" in the past three years; and that achievement is only looked back npon as a contemptibly slnggish march. The present summer, wo are told, is going to exceed anything that has preceded it in the annals of prospecting.

Tho season affords an excellent opportunity to the shrewd capitalist for purchasing valuablo properties cheaply in some of the now neglected districts, many of which comprise mines as good as the best at White Pine—excepting only the Eberhardt.

The district from which I write—Mammoth—comprises miues which will favorably comparo with tho best at White Pine, with the singlo exceptinn noticed, some of them producing sulphides of silver tn within six feet of the surface, identical with the richest oros produced by the Eborhardt; giving by assay from $12,000 to $15,000 per ton. If such ores, in whatever quantity occurring in a finely-formed vein, associated with kindred ores in variable degrees of quality and all the concomitants usual to extensive deposits, are not sufficient to attract attention and command enterprise in mining in older districts than White Pine, the word "mining" may be conveniently expunged from our argentiferous nomenclature, and the word "hunt"—hunting for metals on the surface—substituted.

PRO AND CON.

Ellsworth, Nye Co., May 7, 1869.

THE PATENT OFFICE ON HEALTH.—Statistics have proven that more men become crazed in the Patent Office, at Washington than anywhere else in the Union, and we can quite understand such being the fact, for the mind gets distracted by tho multiplicity and intricacy of the models, and a constant intercourse with men who are all mad on their own particular point; for it is almost impossible to be a snccessful inventor without so concentrating all thought on one focus that there is a burning light there, and vacancy and darkness everywhere else; which gnes far to make the inventor the most disagreeable of society, even if he be the most useful of mankind.

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of home yaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

QUARTZ OPERATOR'S
HAND-BOOK.
—BY—
WHEELER & RANDALL.
San Francisco, 1865.

A cheap and handy book for Quartz Prospectors, Millmen, and Amateur Assayers.

This little work, of 130 pages, although partly devoted to a discussion of limited interest to general readers, contains instructions in the WORKING AND ASSAYING OF ORES, AND TABLES FOR REFERENCE, which renders it quite desirable and of frequent service.
Price, $1, coin—$1 30 in currency or postage stamps. For sale by DEWEY & CO.,
Mining and Scientific Press, San Francisco.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Inventions and Patents.

New Patents Issued to Pacific Coast Inventors.

From official reports to DEWEY & CO., United States and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.

Copies of any U. S. Patent Claims furnished immediately for 75 cents. Full copies of American or Foreign Patent Claims can be obtained by telegraph or mail through this office.

FOR THE WEEK ENDING MAY 18th.

COMBINED COMB AND SHEARS FOR HAIR-CUTTING.—Jos. H. Atkinson, San Francisco, Cal.—90,063.

I claim the clamping-device for adjustably securing a comb to a pair of scissors, consisting of the spring-clamps B B, D, screws A A, and nuts C C, arranged substantially as shown and described.

CLEANSING-LIQUID.—E. J. Balcear, Martinez, assignor to Samuel Pillsbury, San Francisco, Cal.—90,064.

I claim a washing or cleansing fluid, composed of the ingredients named, prepared and mixed in the manner and in about the proportions above specified.

This is the patent under which "Kelly's American Washing Fluid" is manufactured in this city. The inventor is a married lady, and this is the second inventiou upon which she has received U. S. letters patent.

PLOW-CLEVIS.—John Adolph Bilz, Pleasanton, Cal.—90,068.

I claim, 1. The vertical slotted bar E, secured to the ends of the two arms A and B of a clevis, substantially as and for the purpose described.

2. The sliding bar F, moving up and down through slots in said arms A and B, and held at the point desired by means of a set-screw *g*, substantially as and for the purpose described.

3. The shackle G, attached by a swivel-joint to the screw *e*, said screw being secured to the lower end of the sliding bar F, and moving up and down in the vertical slot *a*, substantially as and for the purpose described.

The above invention relates to a new and improved clevis for plowing, so constructed that the depth to which it is desired to run the plow can be regulated as desired, by simply raising and lowering a bar and confining it by means of a set-screw. It also cousists in attaching to this sliding bar a shackle, with a swivel joint, to which the double-tree is secured, and which turns so as to allow the double-tree to remain in its proper position in whatever manner the plow may be turned. For instance, when it is desirable to let the horses stand for a time, the plow is generally thrown over on its side, and when the ordinary clevis is used, this motion turns the double-trees, and causes the tugs to strike the horses' legs, frequently resulting in runaways, which cause much damage; while, when this clevis is used, and the plow thus thrown down, the shackle will turu aud allow the double-trees to remain iu their proper position.

PUMP.—William H. T. Clark, San Francisco, Cal.—90,080.

I claim, 1. The arrangement of the partition *g*, chamber E, valve-chambers C and D, and air-chamber F, within the part A, substantially as described.

2. In combination with the above-named parts, arranged as claimed, the valves *c* and *e*, provided with the raised seats *i*, and radiating guides *r*, substantially as specified.

3. The arrangement of the parts *h h* and *h' h'* in relation to the diaphragm *c*, and with reference to the cylinder B, whereby said cylinder may be attached to the part A, either in a vertical or horizontal position, substantially as set forth.

4. The compound packing-ring M, fastened to the interior flange *p*, together with the elongated plunger H, the whole constructed and arranged substantially as herein described.

This invention has for its object the providing of a double-acting pump that can be used either horizontally or perpendicularly as desired—that is, the cyliuder, in which the piston operates, is so constructed that it can be readily turned from a perpendicular to a horizontal position, or *vice versa*, as desired. The body of the pump is so arranged by means of chambers that the water will always staud at a certain hight in the pump. The general construction is such that any sand which may accumulate in the water chamber will not be drawu up through the valves; or if it should, the valves are so arranged ou raised seats that it canuot in auy manner iuterfere with the operation. The valves themselves arc also peculiar in their construction—the guides being so arrauged that it is impossible for the valves to get out of order or leak. The plunger moves in a peculiar packing, which is not affected by the cutting effect of the sand, and moreover may be easily renewed when desired. The interior of the pump is contiuually submerged in the water, and any accumulating sand may be easily cleared by removiug the plug. Mr. Clark has already introduced quite a number of ingenious and useful inventions.

MACHINE FOR STUFFING HORSE COLLARS.—George W. Hobart, Silvertou, Oregon. 90,170.

I claim, 1. The combination of the crank-wheel D, adjustable crank-pin *d2*, pitman E, sliding block, or cross-head, F, stuffing-rod G, feed-rack I, and hopper L, either or both, tube J, slide K, and adjustable collar-board M, with each other and with the frame B B, C1 C2 C3, substantially as herein shown and described, and for the purpose set forth.

2. Adjustably pivoting the collar-board M to the slide K by meaus of the slotted and recessed plate *k1*, substantially as herein shown and described, and for the purposes set forth.

3. The combination of the rack *k2*, gear-wheel N, shaft G, rack O, pawl U, crank P, pulley Q, rope or chain R, and weight T, with each other, and with the slide K, and beams or bars C1 C2 C3, substantially as herein shown and described, and for the purposes set forth.

GANG-PLOW.—J. W. Lewis, Oregon City, Oregou.—90,178.

I claim; 1. The frame A and draught-pole E, with the platform D for the driver's seat, and the seat F, in combination with the toggle H, lever I, and the rack Ix, all constructed and arranged substantially as and for the purpose specified.

2. The pivoted bar s, guides L' Lx, pin *d*, lever N, carrying the catch O *e*, the chain *ax*, aud pulley *f*, in combination with the axle L, substantially as described, and for the purpose specified.

ORE-CONCENTRATOR.—George W. Strong and Walter L. Strong, San Francisco, Cal.—90,205.

We claim, 1. The vibrating trough C, having the divergent sides E E and inclined bottom N, said sides gradually approaching each other toward the upper end of the trough, substantially as and for the purpose described.

2. A trough, having divergent sides and an inclined bottom, moving on a pivot or standard D, adjustable by means of the pin *a* at one end, and suspended by means of rods *e e*, at the opposite end, said trough having communicated to it a shaking or vibrating motion, substantially as and for the purpose above described.

This is a new device for washing ores for gold or concentrating sulphurets, and consists of an inclined trough, with sloping or divergent sides, narrowing towards the lower end, and leaving only a small opening, through which the water and surplus matter passes off. The inclination of the trough is readily adjustable to the character of the ores aud amount of water which is passing through. The lower end rests upon a firm support, while the upper is loosely suspended from couvenieut arms, so that a shaking motion may be readily imparted to it.

PIPE TONGS.—Bernard Riley, San Francisco, Cal.—90,307.

I claim a gas-pipe tongs, with the combined parts arranged and constructed in the manner substantially as herein described, and for the purposes as above set forth.

New Inventions.

CLEANSING PETROLEUM—OILED WOOL.—Some Petroleum is found 100 per cent. cheaper for oiling wool, in order to spin it, than lard oil; it has beeu used to some extent for that purpose, but much difficulty has been encountered in cleausing the spun product, aud in removing its yellowish color. Mr. L. Houigsberger, of this city, has shown us specimens of petroleum-oiled yarn, which have beeu cured by a very simple process invented by him, and at little cost, showing no traces of the smell or color of petroleum.

DEWEY & Co.

American and Foreign

Patent Agents.

No. 414 Clay Street,

SAN FRANCISCO.

Patents Obtained Promptly.
Caveats Filed Expeditiously.
Patent Reissues Taken Out.
Assignments Made and Recorded in Legal Form.
Copies of Patents and Assignments Procured.
Examinations of Patents made here and at Washington.
Examiuations made of Assignments Recorded in Washington.
Examinations Ordered and Reported by TELEGRAPH.
Rejected Cases taken up and Patents Obtained.
Interferences Prosecuted.
Opinions Rendered regarding the Validity of Patents and Assignments.
Every Legitimate Branch of Patent Agency Business promptly aud thoroughly conducted.

Unsuccessful Applicants

Who are not satisfied with the reference sent to them from the Patent Office, or are dissatisfied with the transactions of their agents, can have their cases thoroughly examined and reported on, by sending us their power of attorney so to do, for a small expense, at most. This can be done without revoking the power of other agencies or in any manner prejudicing the interests of the inventor. Cases which have been resting a long time in the Patent Office have been successfully undertaken by us to the great satisfaction of inventors. Parties who know themselves to be the first and true inventors of valuable inventions should not give up their chances, without investigation, simply because patents have been wrongully issued to others.

A Power of Attorney in the following form will enable us to examine and prosecute any application for a patent which has already been presented to the Commissioner of Patents:

To the Commissioner of Patents:

I hereby constitute and appoint Messrs. DEWEY & Co., of San Francisco, Cal., my true and lawful Attorneys for me and in my name to present and prosecute my application for letters patent of the United States for improvement in steam engines; hereby authorizing and empowering my said Attorneys to associate or substitute other counsel, to alter and amend the specification, to affix my name to the drawings, to receive the Patent, when granted, and generally to exercise all the rights and privileges that I may lawfully claim if personally present and acting in the premises.

JOHN JONES JOHN.

Saeramento, Cal., May 20th, 1869.

Mining Notices--Continued.

Dios Padre Gold and Silver Mining Company, Alamos, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-ninth day of April, 1869, an assessment of three dollars ($3) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. C. McComb, corner of Broadway and Battery streets, San Francisco.

Any stock upon which said assessment shall remain unpaid on the thirty-first day of May, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-first day of June, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. C. McCOMB, Secretary.

Office, cor. Broadway and Battery streets. my1

Douglas Silver Mining Company.—White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixth (6th) day of May, 1869, an assessment of twelve and one-half cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the eighth (8th) day of June, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-first day of June, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, Room 37 New Merchants' Exchange, California street, San Francisco. my8

Daniel Webster Mining Company.—Location of Works: White Pine County, State of Nevada.

ILLINOIS
SILVER MINING COMPANY

White Pine District.

Trustees:
JAS. H. CUTTER, B. H. FREEMAN,
E. H. SHAW, JAS. R. GARNISS,
DAVID BUSH.

The Company's Mine adjoins the celebrated "Silver Glance," and is in close proximity to the "Argyle," and other prominent mines of the District.

From developments already made, the Trustees feel justified in saying to their friends that this is one of the best opportunities ever offered for investment in this State.

For the purpose of further developing the mine, the Company has set aside a limited amount of stock, to be sold as a working capital, of which they now offer 1000 shares, at the nominal price of $2 50 per share, unassessable—the entire proceeds of which will be devoted to developing the mine.

The books of the Company are now open for subscription at the office of the Company, No. 432 Montgomery street, Room No. 1, first floor. By order.

JAS. H. CUTTER, Prestdent.
G. W. STEWART, Secretary.
15v18-2m

CALIFORNIA AVENUE
Homestead Association.

Lots from 26 to 30 Feet Frontage by 120 Feet in Depth, in Blocks 88, 89, 90 and 91, Fronting on California street, between Seventeenth and Twenty-first Avenue.

Shares, $330 Gold Coin,

Payable in Monthly Instalments of $10, without Interest---First Payment, $20.

This Association is organized to purchase a tract of land comprised in the above-mentioned blocks. The location of this property being on THE LINE OF ONE OF THE MAIN AVENUES leading westerly from the business center of the city, and now easily accessible, makes it unsurpassed in present and prospective value by any property in the suburbs of the city. California avenue will at an early day be graded its entire length, and the railroad facilities which will be furnished during the next year will amply accommodate all shareholders who may desire to improve their lots.

There is NO DRIFT SAND on or near this property, and NO HIGH HILLS. The lots are large, and ALL DESIRABLE. TITLE PERFECT.

Its fine location, nearness to the business portions of the city, and the low price at which it is offered, combine to recommend this property to all who desire a profitable investment on easy terms.

Books of subscription open at the office of H. B. CONGDON, No. 619 Montgomery street. 21v18-2t

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the PRESS from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

UNITED STATES AND FOREIGN
PATENT AGENCY.
DEWEY & CO.,
PUBLISHERS MINING AND SCIENTIFIC PRESS.

Pacific Protective Association of California.
INCORPORATED OCTOBER, 1868.

PROSPECTUS.

OBJECT.—The object of this Association is to secure a cash payment, within sixty days after the death of a subscriber, to his or her heirs or assigns of as many dollars as there are individuals of the class to which said deceased subscriber belonged.

MEMBERSHIP.—The subscription fees are Ten Dollars at joining, and One Dollar on the death of each subscriber. The One Dollar from each subscriber is paid to the heirs or assigns of the deceased.

THE FUNDS.—The By-Laws of the Association require that a portion of the money received as subscription fees shall be a Sinking Fund to meet assessments falling due by the delinquencies of subscribers. The balance of the money received to be used for the payment of the expenses incurred by the Association.

MEMBERS.—A subscriber failing to pay his or her assessment of one dollar within Thirty days from receipt of notice forfeits his or her Certificate, and all claims upon the Association, unless good cause is shown for further delay. A subscriber can forward money in advance, which amount will be credited on future assessments. The subscribers are divided into classes including males and females. Each class is limited to 5,000 subscribers. As classes are filled, new ones will be formed. No person is so poor that he cannot pay Ten Dollars at joining and One Dollar occasionally, thus securing $5,000 to his or her heirs or assigns.

ADVANTAGES.—The advantages of this Association are, that no *money panic* can affect it. Its benefits are easily obtainable by all, and every subscriber added to the Association enhances the interest and protection of all; the amount paid being so small, and only at long intervals, that any person can secure for his family a competency upon his death.

CLASSES.—In Class A, all persons between the ages of 15 and 40 years; in Class B, all persons between the ages of 40 and 60 years.

Any one that has not stated his or her age correctly, will forfeit all money paid and his or her Certificate.

One class cannot be assessed if one of another class dies. Classes have no connection with each other.

HOW TO BECOME A MEMBER.—A person desirous of becoming a subscriber must fill out an application, and forward with it Ten Dollars by Check, Draft, or by Express, in gold or silver coin. Persons can pay agents, when regularly appointed and authorized to receive money. Each subscriber should interest himself in obtaining new members, by so doing all are benefited

BOARD OF DIRECTORS.—Benjamin H. Freeman, George H. Russell, Samuel A. Raymond, James A. Pritchard, W. LeRoy.

OFFICERS.—Benjamin H. Freeman, President; George H. Russell, Vice President; John H. Warren, Secretary; James A. Pritchard, Treasurer.

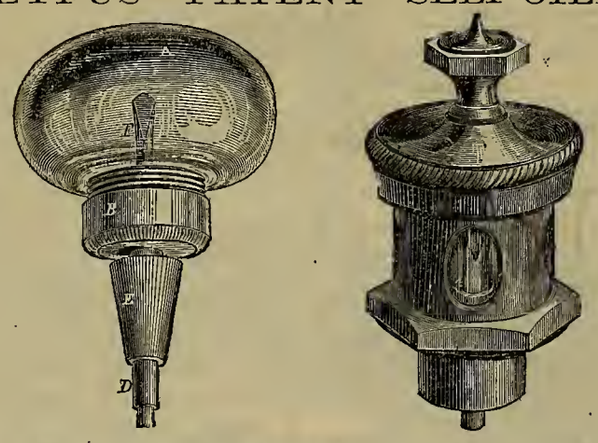
THE STANDARD OF AMERICA.
DREYFUS' PATENT SELF-OILER.



For Locomotives, Marine and Stationary Engines, Fans, Pickers, Looms, Carding and Spinning Frames, Lathes, Saw Frames, Shafting, and Machinery of every description.

A Saving of from 75 to 95 per cent. Guaranteed.

They are composed of a Transparent Glass Cup, mounted in Britannia and Brass, provided with a hollow tube, inside of which is placed a loose-acting solid wire, which acts as a Feeder and Regulator. The wire rests constantly upon the journal, thereby acting with the bearing in its motion. The wire is so regulated inside the tube as to feed according to the demand only. There is no flow of oil whatever while the machinery is not in motion. They are as reliable in winter as in summer, for the reason that the friction produced by the action of the bearing on the wire causes the wire to heat, thereby causing the oil to become limpid. Being perfectly air-tight vessels, the oil will never gum in them, as this has been proven by two years' constant use. They are constructed in a very neat and substantial manner. We spare no pains in making them as perfect as it is possible for them to be made, and GUARANTEE them to give pe fect and entire satisfaction.

DIRECTIONS:

Fill the cup full of oil, then screw the cap down air-tight. Place the tube in the oil-hole in an upright position, or upon an angle of 45 degrees. Permit the rod to have a perfectly free action. If you desire to have the oil flow faster, reduce the wire.

REFERENCES:

For the convenience of persons desiring references, we annex the names of a few Manufacturers and Railroad Companies, who are using the Dreyfus Patent Oiler in different parts of the country: San Francisco—Mission Woolen Mills; Pioneer Woolen Mills; Pacific Woolen Mills; Golden State Foundry; Ætna Foundry; Fulton Foundry; Empire Steam Mills; San Francisco Gas Co.; Mechanics' Mills; Bacon & Co., Printers; Bosqui & Co., Printers; B. A NEW
Gold Metal.

THE GOLD METAL WATCHES

Now being introduced by

C. E. COLLINS & CO.,

No. 629 Washington street,

SAN FRANCISCO,

Surpass anything yet made in the way of an Imitation Gold Watch. They wear well, and keep good time.

The Ladies' Watches cost $8 and $10 each.
The Gentlemen's cost $15 and $20 each.
Chains, from $2 to $6 each.

RECOMMENDATIONS:

SAN FRANCISCO, May 12, 1869.

This to certify, that I have carried one of the small size Gold Metal Watches which I got of C. E. Collins & Co., and I find that it runs as well, and keeps as good time, as any Watch I ever carried, and I can therefore recommend them. I am engaged on the Sacramento steamer "Chrysopolis." C. A. COLBY.

I am an engineer on the San Jose Railroad. I have been carrying one of C. E. Collins & Co's Watches for about one year, and I can safely say it is the *very best* watch for time that I have ever seen. GEO. CORNWALL,
Engineer on the San Jose Railroad.

MESSRS. C. E. COLLINS & CO:—Having heard your watches spoken of in the highest manner, I have resolved to order one for myself. You may send me one of the Lady's $10 Watches, without the chain. Send it as soon as possible, as I am very much in need of a time-piece.
R. B. PATTEN,
Toano, C. P. R. R.

The Public are cautioned against buying their watches at high prices, as many of them are sold for genuine *Gold Watches*, at from $100 to $150 each.

For List of Prices and Description of Goods send directly to us. Can be sent by Express, to be paid for on delivery.

C. E COLLINS & CO.,
No 629 Washington street, San Francisco.

P. S.—Where six Watches of the above are ordered at one time, we will send one extra, free of all charge.

We also deal in the finest Gold and Silver Watches, Watch Materials, etc. Send for circulars or prices.

RANSOME'S PATENT
Diamond Grit Grindstones,

Warranted of Uniform Texture,

TWICE AS STRONG AND WILL CUT AT LEAST TEN TIMES AS FAST AS THE BEST NATURAL STONES.

We manufacture the following qualities, viz:
"Hard," for Machinists, etc.
"Medium," for General Use.
"Soft," for Wood Workers, Etc.,
Diameters, 4 to 70 inches; thickness, ¼ inch to 12 inches; and any fineness required.

Solid Emery Wheels and Sharpening Stones,
Of all forms and materials.

These Stones are fast superseding the natural ones in England, the tests made there showing them to cut about fifty (50) times as fast as the Newcastle, and entirely free from flaws, and hard and soft spots.

☞ Grindstones, with Frames, Iron Troughs, Shafts and Treadles, ready to set up in working order, for sale at wholesale or retail.

Publishers Mining and Scientific Press, 414 Clay st.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into he pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlors made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

ELLERY'S PATENT
India Rubber Cement and Paint
—FOR—
TIN, IRON AND METALLIC ROOFS,
Iron, Brick and Wooden Buildings,
SHIPS, STEAMBOATS, STAGES, CARS,

A NEW SLUICE
For Concentrating Gold, Amalgam, Sulphurets or Black Sand, in Quartz Mills,
OR PLACER MINES.

It is made without iron work, is cheap, durable, and effective; can be made by any good mining carpenter at the mine or mill, of sizes to separate the Sulphurets from one to fifty tons of sand per hour. There is no expense for motive power, or to handle the sand, if it can be run from the mine or mill directly into the receiving sizing boxes by means of water. It is continual, self-discharging, and can be used for concentrating fine gold and black sand, on the river bank or ocean beach. They may be seen at work in the American Company's Mine at North San Juan.

For information how to construct, and the cost, address
ORLANDO JENNINGS,
17v18 North San Juan, Cal.

BY EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co's tariff on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

SAN FRANCISCO
Pioneer Screen Works,
JOHN W. QUICK, Manufacturer,
Removed to A. Pritzel's Iron Works, 203 Fremont street, near Howard, San Francisco.

Screen Punching in all its branches at rates reduced from 25 to 40 per cent. less than the established rates. I can furnish Improved Quartz Screens several sizes finer than any Screen ever punched, giving universal satisfaction, and for strength, cheapness and durability are not excelled. Also, Punched Screens of all sizes and fineness made from all qualities of material, for Quartz, Cement, Flour and Rice Mills, etc. Screen Punching made a specialty; therefore millmen forwarding their orders to me will receive none but the best. Orders solicited.

N. B.—J. W. QUICK is the only competent and successful manufacturer of Screens in the State, having made Screens for the principal mills in this State and adjoining Territories for many years. Quartz mill owners using punched Screens which have universally failed to give satisfaction, when visiting the city will please call and see me. 5v17-1y

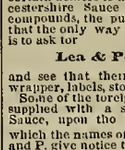
LEA & PERRINS'
CELEBRATED
WORCESTERSHIRE SAUCE



Declared by connoisseurs to be the only
GOOD SAUCE.

The success of this most delicious and unrivalled condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine, is to ask for

Lea & Perrins' Sauce,

and see that their names are upon the wrapper, labels, stopper, and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against Manufacturers and Vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce, and see name on the Wrapper, Label, Bottle, and Stopper.

Wholesale and for Export by the Proprietors, Worcester; Crosse & Blackwell, London, etc., etc.; and by Grocers and Oilmen universally. Agents, CROSS & CO. San Francisco. 3v18-6m

Caution against Fraud.

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.

Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

J. M. BUFFINGTON,
Room 37 New Merchants' Exchange, California street, San Francisco 17v15-tf

Engineering.

THE TELEGRAPH is the index of progress, in our day. It was a grand triumph, when, by the success of the Atlantic cable we first brought under our sway the dominions of Neptune. The North Pole, and Behring's Straits, it is true, failed to succumb to the W. U. Telegraph Line; but Alaska did. The Pacific Railroad followed close after the first Pacific Telegraph. A Washington special says a company has just been organized to build a line from St. Louis through Texas to the Pacific Coast. We learn that the Denver and Santa Fe line, (of some 500 miles) actually pays. The Southern Pacific Railroad, if not a North and South railroad, will be sure to follow.

A dispatch of May 7th states that a Pennsylvania company, with ex-Governor Curtin as President, and A. K. McClure, of Chambersburg, as solicitor, has organized for the construction of a line of telegraph in China. The proposed line is to run from Shanghae to Canton, that is to say, from the estuary of the great Yang Tze River, latitude 31° north, along the coast southward, trending east to the mouth of the Si or Canton River, latitude 23½°. The whole distance is very nearly 1,000 miles, and its route is through the three most wealthy and populous provinces of the empire—Cheh Kiang, Fuh Kien, and Kwang Tung. Already 500 miles of wire are on board ship; and by July 4th, 1870, the Chinese Government will control a live telegraph.

How long will it be before the Russian-Amoor, or Russo-Chinese telegraph line, will be followed up by a Russo-Chinese Railroad, built by American engineers? Not another ten years perhaps.

DREDGING.—At the last meeting of the N. Y. Soc. of Pract. Engineering, Prof. Johnson, of Saco, Maine, exhibited a machine formed something like a harge or boat, and calculated to hold a large amount of sand or mud. At each end is an air chamber, by means of which the boat is supported when full of mud and water, taken from the bottom of the river. At the bottom of the machine is a valve so constructed as to be opened and closed by an operating rod at the top. The boat also contains a chamber for the reception of sand and mud, and a reservoir communicating with the same to be used as a well. From the sand compartment or chamber extends a tube to the bottom of the river, by which the sand and mud is drawn up to the boat. The well is gradually exhausted of water by means of pumps, the top of the boat being covered tightly, and the mud and sand are gradually drawn up until the boat is filled. The use of the valve is for sinking and raising the boat.

ARTESIAN WELL BORING, for irrigation in the southern counties, seems to be found practically and economically successful only to a very limited degree. The expense is great, and the success not always certain—the geological conditions being either little understood, or not apparent to the best judges. Reservoirs are resorted to, with more definite prospects as to the results to be attained. In suitable localities, wells, however, can be bored to advantage. A. A. Boyle, Esq., has bored a well upon his land on the east side of Los Angeles River, seventy-five feet deep, which furnishes twenty-three feet of good water. The well is cased with six inch iron pipe, and proves that an abundance of water can be had upon certain lands by boring a short distance.

BRIDGE BUILDING.—The season's work, under this head, continues. A fine suspension bridge has been built over the Humboldt River, by H. R. Leonard, at Hot Springs, near Elko, on the White Pine road. The bridge is 248 feet long, 16 feet wide, consumed 80,000 feet of lumber, and was built in ten days at a cost of $12,000.

* * Another bridge has been built at Elko, to connect the Gibson road with the town. * * Mr. D. B. Scott, surveyor and civil engineer, has just concluded a survey for a wire bridge across the Yuba at Park's Bar—a private undertaking of Mr. John Rule's.

THE SUEZ CANAL cannot be opened for large vessels, before October or November, since, according to calculations of the engineers, it will take at least five months to fill up the dry depression called the "Bitter Lakes," for a distance of twenty-five miles, to the sea level. A sluice has been cut to admit the waters of the Mediterranean, but much filling in is required.

LOCKS AT THE MOUTH OF TUALATIN RIVER, OREGON.—It is stated on good authority that the project of constructing locks at the mouth of the Tualatin River so as to enable boats to enter that stream from the Willamette, together with the work of erecting a large mill at that place to enable the farmers of Washington County to convert their wheat into flour and get into market at reduced cost, is to go forward this summer in good earnest. It is estimated that $30,000 will suffice for constructing the locks, and that the whole work can be completed in the best style for $100,000. The names of parties are mentioned in connection with it whose well-known enterprise gives assurance that it will be carried through.—*Oregonian.*

WILDS OF THE AMAZON.—A German traveller, Gustav Wallis, who has not been heard of for fourteen years, has just made his appearance in Berlin. During all that time he has been quietly exploring the sources of the Amazon. An affection of the eyes drove him home at last, and he is now in charge of the great oculist, Dr. V. Graefe, who prohibits his reading or writing. The result of his explorations cannot therefore be given to the world, for some time to come.

PRESSURE OF WIND.—The greatest pressure of wind ever registered was at the Glasgow Observatory—fifty-five pounds to the foot. It is estimated that in a hurricane it may reach eighty pounds. The maximum force which it is necessary to reckon upon in the construction of roofs is set down at forty pounds.

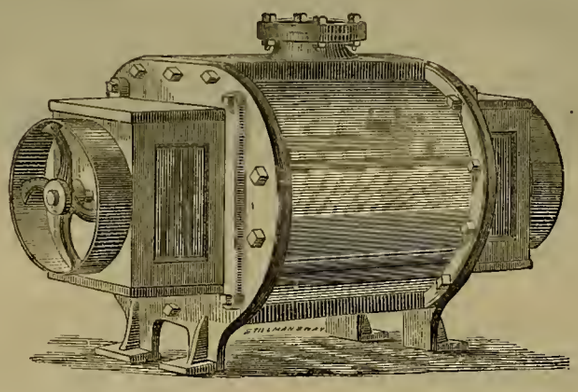
WRITERS should be cautious about addressing correspondence relating to the business or interests of a firm to an individual member thereof, whose absence at the time might cause delay.

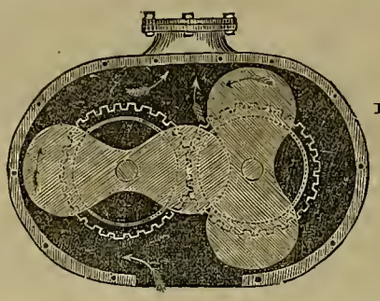
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.



ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

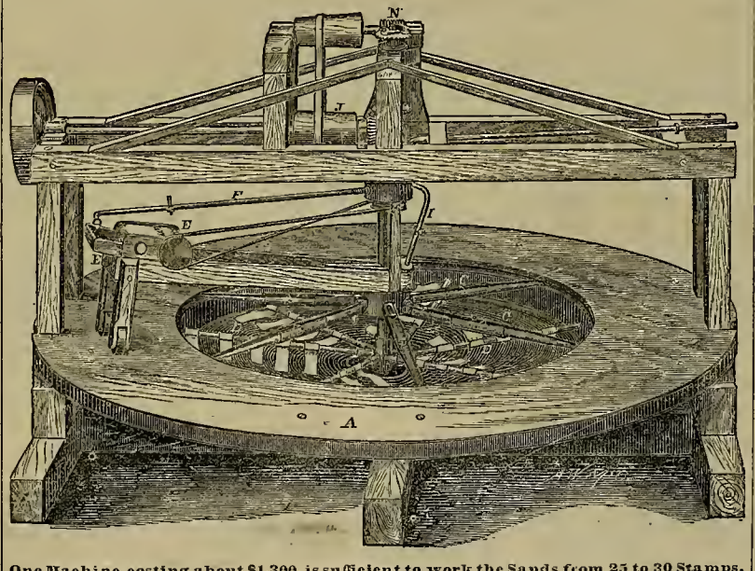
One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address

KEEP & BARGION,
4v16-3m Globe Iron Works, Stockton, Cal.

PAINE & STEPHENS'
IMPROVED CONCENTRATOR,
For Saving Gold and Silver Sulphurets.



One Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps,

Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Banner Co's mill near Nevada, and see for themselves.

CERTIFICATES:

GRASS VALLEY, Jan. 4th, 1869.—This is to certify, that we have used the Paine, Stephens & Harry Concentrators for over twelve months. They have given us entire satisfaction, and are the best we ever used. WILLIAM WATT, Supt. Eureka Mine.

This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphuret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets.
WM. L. TISDALE, Supt. Star Spangled Banner Mine.

NEVADA CITY, Oct. 26, 1868.

Any one wishing to purchase one of these useful machines, can do so by applying to THOS. N. PAINE, at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.

The Pain Killer is sold by all Druggists and dealers in Family Medicines.
REDINGTON & CO., and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents. 1uylm

DR. HALL has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs. Curling, Druit, Lee, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Boech, Sperino, and Dewlz. Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco. 21v18-3m

Mining Property for Sale.

A Two Thirds Interest
OF THE
Golden Rule Mining Company's Claims and Mill,

Situated in Tuolumne County, California, two and a half miles south of Jamestown, on the Great Mother Quartz Lode. A good 15-stamp Water Power Quartz Mill is situated on the property, with a never-failing supply of water, as can be shown by the last four years continual running. This Claim has three parallel Ledges, from 60 to 100 feet apart, averaging from two to six feet in width, with a length of six hundred feet. They are so situated that a tunnel has been run through them at right angles, making a surface drainage of from seventy to eighty feet in depth on the mine. The mine is well ventilated by shafts from the surface, and well timbered so far as worked. In the mine are steam Hoisting Works, capable of hoisting from a depth of 300 feet. A force of thirteen men only are required to keep both mill and mine running regularly.

On the surface and flats for a distance of 500 feet from these veins, the ground or surface was mined by placer miners, in former years, producing from two to five ounces per day to the man, during the season when water could be obtained, which fact goes to prove that a heavy deposit of ore was once contained in the croppings of these shutes, which, by all former and present theories of deep mine workings, came from below, indicating that when sunk upon to a proper depth, the lead will develop a mine equal to the Amador or Eureka.

This claim has paid its 19th regular dividend of $1,500 each, during the past four years, besides all the construction and other expense account, and has levied no assessments during the same time, and at present has on hand $8,000 in the Treasury, and no debts.

The last level, 150 feet from the surface rock, averaged $7 per ton, on which was a profit of from $1 to $1 50 per ton. The length of the two shutes of ore on the east vein, and the only one worked upon, has been about 200 feet.

Now I propose to sell two-thirds of this valuable property for $15,000, cash; and any party who desires to purchase a property of this kind—which theory has proven that it requires depth, on well known shutes of ore, for a sure fortune—can obtain a chance here, providing he or they will go down a sufficient depth. No purchaser is solicited unless he first goes and examine the mine, or sends a mining engineer in whom he can have confidence, to indorse what he may think proper of what has been here stated.

For any further particulars, direct by letter to Wm Bosworth, San Francisco, P. O. Box 1978, or at my office, room No. 5, over Donohoe & Kelly's Bank.
22v18sfqr WM. BOSWORTH.

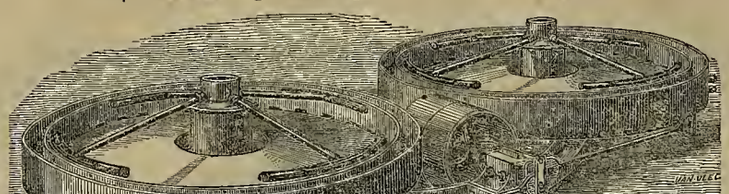
MINING AND SCIENTIFIC PRESS.—This San Francisco journal is an able exponent of the mining interests of the country.—*Empire, White Pine.*

HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.



There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

RECOMMENDATIONS:

SAN FRANCISCO, October 19th, 1868.

MR. M. HUNGERFORD—*Dear Sir:*—We have had twelve of your Concentrators at work at the Oneida Mine, Amador County, for about six months. They give entire satisfaction. They are strong and substantial, requiring, thus far, no repairs, and do their work thoroughly and effectively. At a recent clean-up of four of them, I found that in four weeks' time we saved about $500 in free gold, besides the sulphurets, or not far from one dollar per ton on the entire crushing of the ten stamps connected with them. In my opinion, it is for the interest of every quartz mill to have your machines. Yours, respectfully, GEORGE PRINGLE, Supt. Oneida Mine.

OFFICE OF THE ONEIDA MINING COMPANY, Jackson, May 13th 1868

MR. MORGAN HUNGERFORD—*Dear Sir:*—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any others I have used. I have ordered Messrs. Goss & Lambard to make eight more for me as soon as possible. Very truly yours, JAMES MORGAN.

BIG OAK FLAT, May 25th, 1868.—*Mr. T. W. Mulford*—Dear Sir:—I have used two of M. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

The Hungerford Concentrator has only to be seen to be appreciated. No millman will use any other kind after he has tried that. They are in active operation in mills throughout the State, and give perfect satisfaction.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

In future these Pans will be manufactured by GODDARD & Co., at the Pacific Iron Works, San Francisco, which is a guaranteo that they will be built in the most substantial manner.

Theso Pans may be seen at tho Pacific Iron Works, First street, near Howard, San Francisco.

Address,
GODDARD & CO., San Francisco.
Or M. HUNGERFORD, at the Pacific Iron Works.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucible—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT, Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every one obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass. GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S Hallidie & Co.—Genls.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,

A gentleman of six years experience as First Engineer and Foreman of Quartz Mills in the State of Nevada, wishes a similar situation. No objection to Mexico or the Interior. Inquire at this office, or of W. F. Birch, foreman of the Vulcan Iron Works, San Francisco. 18v18-1m

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

PACIFIC Rolling Mill Company,
SAN FRANCISCO, CAL.

Established for the Manufacture of
RAILROAD AND OTHER IRON
—AND—
Every Variety of Shafting,
Embracing ALL SIZES of
Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames
—ALSO—
HAMMERED IRON
Of every description and size.

☞ Orders addressed to PACIFIC ROLLING MILL COMPANY Post Office, San Francisco, Cal., will receive prompt attention.
☞ The highest price paid for Scrap Iron 9v143m9p

MECHANICAL AND ARCHITECTURAL Drawing School
—FOR—
APPRENTICES.
MR. FREDERICK HELLERT,

An experienced Draughtsman and Teacher, has opened an Evening School at No. 414 CLAY STREET (same entrance as the Mining and Scientific Press Office), where he is giving thorough instructions in DRAWING to apprentices who are inclined to self-improvement. His terms are moderate and within reach of the humblest apprentice; and we are pleased to say that the enterprise is meeting with success.

W. T. GARRATT,
City
BRASS AND BELL FOUNDER

Cor. Mission and Fremont Sts.,
SAN FRANCISCO.

Manufacturer of Brass, Zinc, and Anti-Friction or
Babbet Metal Castings;
CHURCH AND STEAMBOAT
BELLS,
TAVERN AND HAND BELLS AND GONGS.
FIRE ENGINES, FORCE AND LIFT PUMPS, Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder, and Copper Rivets, &c. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles,
HYDRAULIC PIPES AND NOZZELS
For Mining purposes, Iron Steam Pipe furnished with Fittings, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."
☞ Highest Market price paid for OLD BELLS, COPPER AND BRASS. ☜ 6tf

N. W. SPAULDING,
Saw Smithing and Repairing
ESTABLISHMENT.

Nos. 17 and 19 Fremont St., near Market,
MANUFACTURER OF
SPAULDING'S
Patent Tooth Circular Saws:
They have proved themselves to be the most durable and economical Saws in the World.
EACH SAW IS WARRANTED IN EVERY RESPECT.
Particular attention paid to construction of
Portable & Stationary Saw Mills.
MILLS FURNISHED AT SHORT NOTICE,
At the lowest Market Prices.

New Patents and Inventions

Saving of Sulphurets in Hydraulic Mining Sluices.

Very little has been done practically in the way of saving the auriferous iron sulphurets of the gravel mines. They pass down the sluices, and are carried off like any other sand; the supposition being that all the gold in the ancient rivers is free, or if inclosed in iron sulphurets, that the grinding operation in the sluice has liberated it sufficiently to enable mercury to arrest nearly all of it by amalgamation.

Certainly this supposition, and the popular practice are partially if not very glaringly wrong. The next most common substance in the ancient river beds, beside boulders of quartz diorite and porphyry, is iron pyrites. To what extent these are auriferous appears to be little regarded or understood. We see no reason why they should not be as rich in places as are the vein pyrites. Assays, we know, are seldom made.

By means of what is known as the under-current sluice attention has been given to the further separate washing and more careful amalgamation treatment of these river pyrites. But if the vein pyrites will not give up their gold to quicksilver in the battery or pan under the most thorough disintegration and long-continued rubbing in contact with quicksilver, how are we to expect anything better from a transitory passage with water in a mining sluice?

It is merely a question whether what is left in the sluice pyrites will pay for separate treatment by pan or arastra amalgamation or by chlorination. In one locality that we know of, the under-current sluice and separate treatment of sulphurets has been made quite a feature of; and during two years of trial, these experiments have been found amply remunerative. We refer to the American mine, near North San Juan, Nevada County,—on the ancient great Yuba channel one thousand feet above the present river. The ordinary under-current sluice is nothing more than a wider sluice, underneath and at right angles to the main sluice, which is provided with more delicate and perfect washing and amalgamating conditions; only the finer particles falling into it, through cross-bars in the main sluice. The bars, and openings between them, are both about 1½ inches in dimensions, and underneath them is a sheet iron sieve, having holes of about pea size. All of the heavy grinding boulders, and nearly all of the water, pass on as usual. There are usually four or five boxes in the under-current sluice, each fourteen feet long and ten to twenty feet wide; but the object is merely a further washing and amalgamation, not the saving and further treatment of sulphurets, for these all pass away.

At North San Juan, there are now two methods in vogue for saving the sulphurets from the sluice. One of these is the invention of Orlando Jennings, described and illustrated by a diagram in the MINING AND SCIENTIFIC PRESS of April 24th. We understand that this is in use in the American mine. The other method is the use of one or two under-current sluice boxes—fourteen feet long and two feet wide—constructed and arranged with a view to catching sulphurets, instead of washing out the gold only. To effect the purpose, the sluice is dammed up by means of a slat or lath across it at its lower end; when this has been filled with sulphurets, another slat is added, and so on, until the entire box is filled. Then the current is let into another similar under-current box, while the one just filled is being emptied.

The further treatment of these sulphurets admits of great variation, according to the degree of clearness deemed most desirable, and the method of gold extraction that may be preferred. At the American they are worked by arastra amalgamation. What might be saved by subjecting them to chlorination, or by the adoption of the principles of heap-roasting, or weathering, appears to be entirely an unexperimented field. If the ordinary under-current sluice sulphurets, that pass off as tailings where the washing and saving of gold is the object, should be found to assay any amount worthy of consideration, the application of some of the finer ore-dressing machines in use elsewhere, such as the Rittinger "pointed box," the percussion table, the common sieve buddle, or the continuous discharge sieve buddle, are worthy of trial in experienced hands. So great are the well known losses in tailings from hydraulic sluices that we may reasonably hope yet for a material increase in the relative if not in the positive yield of the precious metal, from the wonderful ancient rivers of the golden foot-hills.

The Coming Institute Fair.

Applications for space are coming in with an unexpected rapidity, from every direction; so we are informed by the agent. It is evident that the Fair of 1869 is destined to prove a great success. Everybody that has any business, or who can possibly derive any benefit from participation in thus cultivating the development of either special or of general resources pertaining to the western coast, seems to be wide awake to the importance of being engaged in *this* exhibition especially. No bluster or extraordinary preparations are observable; but we see many indications that sufficient enthusiasm will be generated by the occasion itself, to answer the best purposes of success in an undertaking of the kind. This aspect of the coming Fair is surely a matter of congratulation, to everybody concerned.

The exhibition of 1869 will give a truer picture of the condition of California and her sister States than last year's Fair did because less will be done by individuals to make extraordinary display, while everything from everywhere will be represented in its workmanlike garb. We now take our position in the world, for our communications are made; we know how we stand, comprehending a little better how we are destined to be connected in the future. It is not only a free field, without grinding monopoly, but there never peopled any great country, on the face of the globe, a more generous race. Producers and manufacturers alike are here punctually of their own accord;—but let us suggest that in planning each one's articles and space for exhibition as much more than mere business be had in view as possible, since a little thoughtfulness touching the general aspect that things will have, and a little ingenuity applied to making each department *instructive*, will at no additional expense multiply incomparably the aggregate value of the exhibition, and contribute more than mere bringing together of articles to the suggestiveness of comparison—in the past, present and future tense—wherein must lie the real success of the Fair.

A new circular has been issued by the President, Mr. Hallidie, announcing that the opening is to take place at 11 A. M. on the 14th of September, and that desired information can be obtained by addressing J. H. Gilmore, Corresponding Secretary of the Mechanics' Institute of the city of San Francisco, to whom all communications must be addressed, or articles for exhibition consigned. The city canvasser is Mr. Stoddard.

Reese River and the Reveille.

The sprightly *Reveille* announces that it will, hereafter, cease to be a daily, and will appear as a weekly; in doing so it states its reason in a manly way. There was a significance and character in the name of that paper appropriate of the times when "Reese River" was silver, and fortune, and life itself in the desert unknown, far to the eastward of the Kingsbury grade when we looked towards the rising sun and *imagined*, by the side of Austin's unheard of ore, in sage brush and pack saddles that which we did not know of the Great Basin. Now, the strangeness of it is that it was only so short a time ago, and that our view of things in that direction has so changed. Austin was the pioneer city in the eastward march, and we will not forget the preciousness and the genuiness of its silver. Never was there a town worse jilted by fortune, more mercilessly outflanked, apparently—but not wholly or really so, for Austin is undoubtedly under estimated just now, as anybody can appreciate who has groped through its red antimonial silver veins, or who ever notes the figures of its bullion product oven, by the side of White Pine to-day. Fate is savagely retributive on the *Reveille* for its sarcasms against White Pine, the last new outpost in the line; but the *Reveille* was in truth seldom unjust, and Austin can well spare its nonworking, purely hoping population. It does not need great show to make a permanent and prosperous mining town. Austin will surely hold out on its own proper basis henceforth.

Personal.

We notice with much pleasure the return of Mr. Charles C. Rueger from a more than three years' sojourn in foreign mining academies, mining districts and metallurgical works. We know Mr. Rueger to have been a most energetic and indefatigable worker. He will take rank in our midst not only as a mineralogist and as a competent engineer, but his eminently practical turn of mind has procured him, under the tutorship of the most successful and renowned civil and mechanical engineers and metallurgists of the day, an acquaintance with foreign mining machinery and processes—the old and well-tried, as well as the newest—such as probably not more than half a dozen men on this coast have had the good fortune to be able to acquire. In saying this of Mr. Rueger alone, we would be doing injustice to a number of other very energetic young Americans whose scientific pursuits abroad have taken similar practical direction, suggested by our mining developments since 1860. Our country is growing; it has had a full quota of its best young minds engaged in gathering from abroad that which is most useful, most adapted to our American circumstances, and most likely to contribute to our advancement. It will have nothing to be ashamed of in them, nor in the practical road that their intelligence will direct us into.

NAPA MANGANESE MINE.—Captain Chedwick has shown us some fine specimens of massive pyrolusite, or soft manganese ore, from the Russ mine, six miles from St. Helena, Napa County, in which he is interested. The specimens are absolutely pure. Ore of 90 per cent. purity can be taken out, we are told, to a quantity of 2,000 tons, after which further development may or may not show continued richness. A sloop load has been brought to this city and shipped to England. The mine is understood to be a vein deposit, like most of our California manganese. So plentiful are the ores of manganese in this country—oxide, silicate, and carbonate—that the world could be supplied, for bleaching, iron making purposes, etc. A considerable market for it exists locally, arising from the quantities needed for sulphuret chlorination, and latterly also for silver chlorination.

[From Rowlandson's "Earthquake Dangers, Causes and Palliatives."—just published.]

Palliatives, Suggestions and Conclusions

[Continued from Page 338.]

Respecting wooden or frame buildings, notwithstanding no actual danger may be apprehended by the sole use of timber, in the construction of elevated dwellings, such as those of four stories elevation, it is by no means advisable that dwellings so constructed should exceed two stories in bight, the great flexibility of the material making it more susceptible to the effects of the earthquake shock, as compared with those of bricks. If it happens on such occurrences, that any inmates should be occupying the upper stories, the swaying motion may become alarming, though not actually dangerous; to females in particular, such feelings of alarm are particularly likely to prevail with considerable force. In fact, I am perfectly well acquainted with the case of a lady who was months before she recovered from the effects of the shock of the 21st of October, 1868, in consequence of the sensations occasioned by a motion such as described, which occurred in the fourth story of a dwelling situate in the higher part of Post street. I may state that the lady is not by any means possessed of a timid disposition. As one of those apparent anomalies of earthquakes, it may be mentioned that the husband of the lady alluded to was at the same time taking a stroll amongst the bushes on the contiguous sand-hills, and felt the shock so slightly that he was not aware that an earthquake had occurred until his return home.

There can be no doubt, however, that had a dwelling of similar character been erected on the sand-hills alluded to, the swaying motion would have been equally great, provided the stratum below the sand-hills was of a similar lithological character. It is such apparent discrepancies that have lent so much aid to the dissemination of the magnetic and electric theories of the origin of earthquakes.

Power of ornamentation will undoubtedly possess a powerful influence in deciding what shall be the species of domestic architecture hereafter to be adopted generally throughout the State. In this respect wood possesses great advantages over dwellings whose walls are composed of brick or stone; the adaptability of wood for gilding and exterior polychromic adornment is illimitable, and peculiarly so with a great variety of Asiatic architectural styles. Many of these are peculiarly suitable for rural dwellings, whether it relates to the erection of a simple cottage or one of palatial proportions. The styles alluded to embrace all the varieties that dome shaped structures are capable of assuming, either with or without the accessories of towers and minarets; glass and ironcombined with wood, as materials, are peculiarly well adapted for the kinds of architecture noticed, and for accompanying floral and subordinate arboral ornamentation, none excel them. Fountains in many cases could be brought in aid to highten exterior and interior effects, while the waters might by easy contrivances be made economically available for irrigating purposes. Such are some, and only some, of the amenities which may be made to pertain to rural wooden structures by the judicious employment of coloring, gilding and varnish. For interiors, in place of plaster, less pretentious dwellings may be made secure, comfortable and ornamental, by due attention to the graining of the timber employed in interior linings, especially as many varieties are susceptible of tints agreeable to the eye, while those of a more extended and expensive description possess, in *papier-mache* and *carton-pierre*, a plastic material of almost limitless application for the purposes of wall and ceiling decoration. It may seem Utopian to some to here make allusion to substances whose useful applications are at present so little known in this community; but if this State is at all to equal the aspirations expressed by many, as a textile producing country (and few can appreciate its capabilities in this respect in a higher degree than the writer), we shall in a short period possess in the waste materials of such crops a practically illimitable source of the raw material required for making the useful and decorative articles alluded to; one of the chief utilities of which would be found to consist in the circumstance, that owing to their greater elastic limits, as compared with lime plaster, they would not injure by cracking, either from natural atmospheric causes or the effects of earthquake shocks.

A draw-back to the advantages above set forth of using wood for architectural designs exists in its inflammable character, to which may also be added its general liability to decadence. I shall allude to these two drawbacks as one, because both are preventable and can be attained by the same means at one operation. If, however, these valuable results are to be made practically and economically available, it will be requisite that the substances to be employed for the purposes proposed shall be attainable like the sources of raw material for making *papier-mache*, those generally consumed by the paper manufacturer, or the agriculturist for manure, viz: the employment of substances valueless for any other purpose than some particular specialty. We possess, in this city, about half a dozen modes and proposals of modes, for preserving timber, but the substance or substances employed for this purpose cost in the average from two to two and a half cents per pound. In order to be sufficiently economical to thoroughly impregnate timber with any of the substances so proposed to be employed, these chemicals ought not to cost much more than the charges of hauling and the requisite manual labor required in handling.

We ought to be under no necessity of importing these substances, for in California we have a limitless field for their cheap production, as will become evident whenever a rational system of metallurgy is adopted by those interested in the reduction of our auriferous and argentiferous ores; space, and time also, now forbid entering into any lengthy details on this branch of the subject. If sufficient attention is given to the present treatise by the amount of patronage accorded, I shall probably be induced to present an extra sheet relating to these matters at an early day.

On the use of iron in strengthening wooden, stone and brick buildings, I shall omit making notice from want of space at my disposal. I the more regret this circumstance, as I see that metal in many cases most inappropriately applied for the purposes intended. If, however, what is now given to the public meets with its approbation, it will be easy for me, in a second part, to give *in extenso* my views on this and many other subjects, which are either wholly omitted or only partially touched upon.

The delay so occasioned by the omission at the present time of the matters noted will probably prove advantageous to the future rational discussion of those which are omitted, for in order to do this it is indispensably requisite that we should in the first place fully comprehend what an earthquake is, and consequently its origin. It has been one of the chief aims of the writer to impress his readers as far as in his power lies, with what he considers to be the true *vera causa*. When this is well understood and acquiesced in, the appropriate construction of buildings to resist earthquake shocks becomes comparatively easy. An increased length and diminished thickness of brick, as previously noticed, would, I think, when laid in good lime mortar, mixed in the proportious named, accomplish all that is needed for safety, so far as security may depend upon the character of the materials employed in the construction of interior and exterior brick walls. The *bond* is the next matter of importance, and that should be either the genuine English or Flemish, with bricks of the form of 8x4x2½ inches; the English will be found the best. If, however, bricks were made 12x4x2, as suggested to me by an architect of this city, instead of six inches wide, as named by me in a former page, perhaps the Flemish bond might be found to possess some advantages; under any circumstances, if a law does not now exist, one ought to be obtained as early as possible, prohibiting, under the severest penalties, the erection of brick walls unless the bond alternated every other course, one of which should be the compulsory re-erection of any portion of a wall in which a layer of stretchers was not overlaid by a layer of headers. It has frequently been noticed by architects that corbels should be used for the support of joists and timbers. These possess many advantages. Such a mode, however, presents some that are not so, when we come to examine into the conditions which may occur with earthquakes.

When properly explained and fully understood, the earthquake becomes far less mysterious than thunder and lightning, and with the dissipation of the mystery hitherto accorded to its dynamic origin, much of the alarm arising from its occurrence, it is boped, will cease to trouble timid minds. Timidity has certainly been carried to excess by those who have left or expressed a purpose of leaving this State on account of earthquakes. To such the question may be asked, where would they go to avoid earthquakes? To Massachusetts? Why, Boston was shaken to its very center by an earthquake in 1755. To Missouri and the Valley of the Mississippi? This large section of the United States was agitated by earthquakes for months during the year 1812. To England? When Shakspeare wrote the splendidly poetical description of earthquakes in which he so graphically states,

"Shakes the old beldame Earth, and topples down
High tow'rs and moss-grown steeples."

These sentiments were written by the bard of Avon under the inspiration of the traditional accounts handed down to his time, of a severe earthquake that took place in England about a century previous, at which period several churches in that kingdom had been leveled, and cathedrals damaged by one of these phenomena. Where, then, shall the timid flee in order to avoid earthquakes?

It is well observed by Mr. Mallet, that "all human difficulties to be dealt with must be understood. Were understanding and skill applied to the future construction of bouses and cities in Southern Italy, few, if any human lives, need ever be again lost by earthquakes, which there must recur in their times and seasons." Mr. Mallet states that this important fact has been pointed out by several Italian writers, and that Colosimo, in a brief account of the Calabrian shock of 1832, has described some of the conditions that should be observed in the erection of buildings. Read California for Southern Italy, and the remark will apply with equal, if not greater force.

Another English Novelty.—*The Engineer* describes and pictures a little instrument called the "electric wand," invented by an F.R.A.S., whose name is given,—"which has deservedly begun to meet with a large sale," and so forth, and so forth, in the usual style. It is a glass tube, with a wooden handle, and a rubber, to which a small Leyden jar is attached; and is described as the simplest frictional electrical machine in the world,—"as compared with its power"—*(sic)*.

Now, although this is a very trifling matter, yet, as we have had something to say of the way our English friends have of complacently monopolizing all the credit of every invention which promises to be "a success," we will just quietly remark that an old uncle of ours got up this very thing twenty-five or thirty years ago, to please the children with—as we most vividly recollect; and we think he afterwards patented it. At any rate it has been in use, more or less, ever since. It differed from the F.R.A.S.'s only in having the Leyden jar separate from the rubber.

Magnesite or Meerschaum.—This is a product of the decomposition of carbonate of magnesia. When first dug up, it is damp, soft, and greasy. The Tartars use it as a soap to wash linen, and the Arabs in baths.

Spain is to elect a sovereign in October next. A new Provisional Ministry will be formed to conduct the affairs of the government in the interim.

Commissioner Fisher.

When Samuel S. Fisher, Esq., of Cincinnati, was confirmed in the appointment of Commissioner of Patents, we published a few brief remarks from our Washington Agent highly complimenting the new appointee, and we are now glad to note the following corresponding good opinion recently expressed by the *Scientific American:*

Mr. Fisher is comparatively a young man, being but 37 years of age. He is a native of Michigan; studied law at Philadelphia, and afterward removed to Cincinnati, where, for fifteen years, he practiced his profession with that success which always follows ability, industry, and sterling integrity.

During the war, and when one-hundred-day regiments were called out, Mr. Fisher served as Colonel of the 138th Ohio, operating in front of Petersburg, Va. He now holds the responsible position of President of the Board of Education, of Cincinnati, and is highly esteemed in that city as a Christian citizen and an efficient co-worker in all public enterprises and reforms. Mr. Fisher was appointed entirely without solicitation on his own part. He is not indebted to any outside influence for the honor conferred upon him, and enters upon his duties entirely independent of political or patent cliques. From our knowledge of the character and antecedents of the new incumbent, we do not hesitate to say, that inventors may rely upon him as a true friend; and, furthermore, that the duties of the commissionership will be administered by himself, and without the intrusive assistance of certain parties who seem to act as though the Patent Office was under their special guardianship, and the Commissioner a mere appendage to a lobby, which has cast a shadow over the good character of that office.

Commissioner Fisher is a hard worker, and, if business of the Patent Office flags—if there are any drones in this hive of industry—he will be apt to inquire the reason why. He takes hold of the affairs of the Patent Office with an earnest purpose to effect a speedy reform of past abuses. He recently invited the Examiners and Assistant Examiners to his room, where some time was spent in interchange of views regarding the business of the office as it relates to the examination of cases, and he proposes to dispense with some of the present useless forms, in order to facilitate the procuring of patents. The Commissioner gave some opinions for the guidance of the examiners, in order to secure more uniformity in the general practice of the office.

Ohio Solons.

The Legislature of Ohio propose to pass a bill making it necessary that a note given in purchase of a patent right shall so state upon its face. The notion of these wiseacres is that it is doubtful whether there is any value received in the case:—and that the note should therefore be one which is not negotiable, so that the purchaser can refuse to pay if he finds the patent less valuable than he expected. By this sort of thing, the inventor is virtually prohibited from bringing his patent before the public and proving its value by the aid of money raised from the sale of a part of it,—until he has *first* proved its value by bringing it before the public! O wise men! O most excellent legislators! Let us hope that they will not next pass a law forbidding a man's going into the water until he has learned to swim!

One word about promissory notes. A contract is one thing, and a note is another thing. If it isn't it ought to be. A note, for instance, given in payment for a horse, ought to be binding, even if the animal's tail should drop off the next day. The purchaser's remedy should be in other statutes, just as much as if he had paid *cash* for the horse. The expression "for value received" should suffice to make the writing money in the eyes of all men who believe in the drawer's ability to pay, whether an equivalent passed or not. It is at best a mere fiction. How could business be carried on if the question of value received were actually raised in the case of every note that circulates?

Mechanical Progress.

The Telo-Dynamic System.

Mr. Hirn's plan for transmitting power through long distances, which we have before spoken of in the PRESS, is based on the following principle,—as stated in the *Journal of Practical Mechanics:*

"If we suppose a band of round iron of one inch in diameter to be capable of sustaining a steady pull, without sensible alteration, of ten tons, and that the bar be pulled with this force endways, so that a point between the motor and the resistance moves at the rate of one foot per second, then it is obvious that the bar itself will be transmitting 'work' at the rate of ten foot-tons per second. A bar of half its diameter, or one-fourth its section, can only be strained to 2·5 tons, and at the same rate of 'end-on' motion, can only transmit 2·5 foot-tons of work per second; and so also of a bar one-fifth of an inch diameter, or one-twenty-fifth of the area of the one-inch bar, it can only transmit ·04 ton, and, at the rate of one foot per second, ·04 foot-tons of work. But suppose that the half-inch bar moves end-on at the rate of four feet per second, and that the one-fifth inch diameter wire moves at the rate of twenty-five feet per second, then, as work is made up of pressure, time and velocity, all three bars, much as they differ in section and in absolute strain upon each, will transmit the same number of foot-tons per second: *i. e., shall all be capable at the resisting end of delivering forth equal quantities of motive power in equal times.* If, therefore, we increase the velocity of motion of the wrapping connector, which is intended to transmit a given amount of motive work in a given time, we may reduce its section, because we have reduced the strain upon it, and hence its total weight in the inverse ratio of the increased velocity. We may, in fact, to put an extreme illustration, reduce the one-inch round bar to an iron wire, as fine as a human hair, and yet (theoretically) get out of it at the resisting end our ten foot-tons per second."

Mr. Hirn makes his pulleys of steel, with a V-shaped groove, having at the bottom a ring of softened gutta percha, upon which the wire rope of transmission bears. With two pulleys, each of twelve feet diameter, making 100 revolutions per minute, and with a wire cord of two-fifths of an inch in diameter, he found that 120 horse-power can be transmitted 150 yards with a loss of only 2½ horse-power. He has proved that 120 horse-power may be transmitted twelve miles, leaving at least ninety horse-power available at the remote end; whereas, with ordinary horizontal shafting, to secure the same available power at the same distance, over 700,000 horse-power would be required at the motor end.

FRENCH SILVER.—This differs from German silver in having part of the zinc replaced by cadmium. The recipe is as follows: Seventy parts of copper, 20 of nickel, 5½ of zinc, and 4½ of cadmium. It is very hard, and is capable of taking a brilliant polish.

Another is composed of copper 56 per cent., nickel 40.64, tungsten 2·80, aluminum 0·56. It is white, ductile, malleable, tenacious, and sonorous. Its specific gravity is nine-tenths that of silver, and its fusibility less.

TO DISTINGUISH STEEL FROM MALLEABLE IRON.—Moisten with a drop of dilute nitric acid. A dark gray spot will be produced upon steel; a green one upon malleable iron.

DISCHARGING SHIPS OF GRAIN.—A new English method is by a large screw revolving in an upright cylinder, one end of which rests in the hold. This does its work very rapidly, and will answer to raise either grain or water, or a mixture of the two.

ZINC FOR BUILDING.—It appears from actual experiment that oxidation proceeds for about four years, gradually diminishing after the first three months, when it hardens into a protecting coat of a dark gray color, preserving the metal beneath from further deterioration. It appears to be evident that a sheet of zinc exposed to the atmosphere for a series of years loses little or nothing of its weight or thickness, and that its surface remains hard and polished like enamel.—*Iron Age.*

Heavy Forging.

The New York *Artisan* of April 7th, describes the recent forging in that city of a paddle-shaft for one of the new steamships of the Pacific Mail Co. We quote a part of the article: "These shafts are the largest ever made, being thirty-nine feet in length, and thirty-two inches in diameter in the largest part. They weigh, after finishing, about forty tons each. They are made of Lake Superior iron, which is brought to the forge in pigs and puddled in the establishment. The puddle-balls are first made into slabs about thirty inches long, and five or six inches square, and weighing from 200 to 250 pounds each, two balls forming a slab; and the shaft is produced by "faggoting" and welding these slabs together in such a manner as to keep adding to the shaft lengthwise. The heats are taken in a reverberatory furnace with an air blast, and worked under a nine-ton steam hammer, while the shaft is slung in such a manner as to be nearly balanced in a crane by which it is drawn from the furnace, the shaft being turned upon the anvil by means of levers clamped to it. From four to five heats are worked in a day, and from fifteen to eighteen days are occupied in making one of these shafts. So perfect were the arrangements that this ponderous mass was moved lengthwise and turned upon the anvil with as much apparent ease as though it had been a nail rod. These shafts are larger in diameter, by nearly one-fourth, than the paddle-shafts of the Great Eastern. The quality of the iron of which they are made is such that a bar of it can be doubled while cold, with a perfectly sharp bend, without breaking."

CREOSOTE AS FUEL.—The following is from the London *Daily News:* "At Mr. John Schwartz's sugar refinery in Pelham street, Spitalfields, more than one thousand gallons of creosote oil are daily consumed in heating his two furnaces, which are of one hundred and forty horse-power. According to his calculation, two hundred and twenty gallons of the oil—the cost of which is one penny a gallon—equal in heating power two and a half tons of coals, and one pound of the oil will evaporate thirteen pounds of water, whereas one pound of coal will evaporate seven pounds of water.

It is more economical, more cleanly, and less offensive than any other kind of fuel, emitting neither smoke nor smell. Mr. Schwartz's furnaces are supplied from a large tank, from which the creosote flows through a pipe into the furnace, along the sides of which it is propelled by a jet of steam. Coming in contact with the fire (of which there is a small basis in the shape of a red hot coke and brick) it ignites, and burns fiercely with a pure white flame; and the combustion, being perfect, leaves no residuum of any kind."

THE INDICATOR.—When it is practicable, diagrams should be taken from each end of the cylinder. The assumption that, if the valves are set equal, the diagram from one end will be like that from the other, is erroneous, owing to the difference in the speed of the piston at the opposite ends of the cylinder. This is, at the outer end of a direct-acting engine, from 35 to 66 per cent. greater than at the crank-end, the difference varying according to the degree of angular vibration of the connecting rod. In side-lever or beam engines, these proportions are reversed, and the speed of the piston is greater at the upper end of the cylinder. Often, also, there is a difference in the lengths of the thoroughfares, and in the lead, or amount of opening, or the point of closing; and many times the valves are supposed to be correctly set, when this indicator will show that they are not. These and many other causes, will make a difference in the diagrams obtained from the opposite sides of the piston. One use of the indicator is in fact to show whether or not the diagrams from opposite ends of the cylinder are alike.—*Scientific American.*

THE INJECTOR.—On locomotives in Germany the injector is more and more superseding pumps for feeding, even independent steam pumps. Its advantages are that it works with certainty and needs no repairs. Herr Krauss, constructor, of Munich, has reduced this instrument to extreme simplicity. The water flows in a straight line from the tank into the boiler. There is no movable cone to regulate the influx of water; nor is there any movable coned needle to regulate the admission of steam. The steam nozzle enters the water-chamber, and bends into center line at the point best for general working, and thus the whole instrument is solid.—*Artisan.*

Scientific Progress.

The Phenomena of Boiling Liquids.

Charles Tomlinson, F.R.S., F.C.S., says that the "promoters of vaporization," or as he terms them, "nuclei,"—of which we have before spoken in the PRESS,—are not so by virtue of their roughened or sharp-pointed edges, but in consequence of their retaining some impurity upon their surfaces. If made chemically clean, they cease to act as nuclei, because the water then adheres to them, without giving up its vapor,—consequently the boiling is no longer tranquil, but attended with violent bumpings,—due to the intermittent escape of the vapor when the water can hold no more. A rat-tail file, for example, is ordinarily a nucleus, because it collects between its teeth greasy matter, and other impurities to which the water will not adhere. But if passed through the flame of a spirit lamp, it becomes "denucleized" in being cleansed, and then causes no action when plunged, as before, into hot water just below the boiling point. If, however, it be now waved in the air, it will again excite the liquid to action, on being returned to it. It has, in the waving, gathered motes or specks of dust which were floating in the air,—and is again a nucleus. Among Mr. T.'s experiments were the following:

"Ether was raised to the boiling point, and a pellet of paper thrown into the tube. The liquid boiled up furiously, the paper being much agitated, when suddenly it sank as if struck dead, and all vapor-giving action ceased. It had in fact become chemically clean. The paper was removed, and a brass wire passed down to the bottom of the tube, when the liquid boiled up briskly during a few seconds, but on the wire becoming clean all action ceased, except from a point near the bottom of the wire, which poured off a stream of bubbles. The wire was taken out and filed, in order to get rid of this nucleus, but the active point was got rid of, for there were now two such points giving off rapid discharges of vapor. These points were probably bits of porous dross entangled in the metal.

Methylated spirit boiling at 171° Fah. was kept at about that point. A piece of flint was put into the tube; abundance of vapor was given off from its surface. The newly fractured surfaces being chemically clean, were quite inactive, not a single bubble of vapor appearing on them, while the old surfaces continued to give off vapor as before. Five ounces of distilled water in a clean flask boiled at 213 17-20° Fah. Some clean mercury was poured in,—enough to form a ring at the bottom of the flask. The water rose to 214°, with much bumping; steam forming under the mercury, and distending it into hemispheres, each of which burst with a kick. While this uneasy boiling was going on, a very little dirty mercury was added; and although the quantity was not more than one-sixth of that previously added, the effect was remarkable. Instead of the uneasy kicking, jerking bursts, the boiling became brisk, easy, and soft, rapid volleys of steam-balls being given off by the metal, breaking up the mass of water, while the temperature remained steady at 212 2-20°."

Many substances which may be used as nuclei are not well suited for the purpose, because they soon become clean and cease to act. But porous bodies, such as charcoal, pumice stone, etc., are permanent in such action. They probably act by capillarity, in separating the water from the vapor. Mr. Tomlinson remarked upon the practical value of the principle which he claims to have discovered, inasmuch as the chemist in the laboratory now has an explanation and a remedy for the successive dull explosions which often endanger the flasks in which boiling is accomplished. Also in the hint it furnishes towards lessening the strain upon large steam boilers. Also in the economizing of the heat in sugar boiling, distilling, and other manufactures. By preventing the waste of heat in the jerky explosions, a greater amount of distillate is obtained with the same amount of fuel.

ELECTRO-CHEMICAL TREATMENT OF SILVER ORES.—M. Becquerel has presented to the Academy of Sciences a paper upon a process which he claims to have pointed out some years ago, viz.,—"the Electro-Chemical Treatment of Minerals of Silver, Copper and Lead." The method consists in the employment of galvanic couples composed of zinc, iron, and lead, associated with plates of copper or a piece of well-baked carbon. The plates of non-oxidable metal or the non-metallic conductive substances were put in immediate contact with the argentiferous metallic solution, whilst the plates of oxidable metal were placed in a permeable diaphragm made with untanned hide. This was filled with salt and water, and the plates were then put in metallic communication with each other. The mineral was placed in the vessel containing the saline solution, and was rapidly stirred by machinery for the purpose. The mineral being deposited, the liquid was decanted into other basins, in which the galvanic couples were placed.

The Monster Induction Coil.

The London Polytechnic Institution now has the largest induction coil in the world. It is 9 ft. 10 inches in length, and 2 ft. in diameter. It will,—says *The Engineer,*—furnish a spark 29 in. in length, and apparently ¾ in. in width, striking the disk terminal with a stunning shock. The power of this flash may be estimated from the fact that it will perforate a mass of plate glass 5 in. in thickness. The channel made by its passage is about 1-50th of an inch in diameter, and has a zigzag course; but all round it the glass is starred in radiating lines, which make the perforation appear larger than it really is. When the terminals are brought within 3 in. of each other, the discharge issues slowly as a brush of waving flame, and this flame may be blown away in a broad sheet, leaving the actual line of discharge unaffected and visible by its different color. Some other phenomena, hitherto only discoverable by the most delicate instruments, have already been rendered plainly apparent to the senses, and for some time to come it is probable that each day will be marked by new discoveries. As a source of ordinary electricity the power of the coil is beyond all expectation. It will charge a Leyden battery of forty square feet by three contacts of the break; and the discharge of this battery deflagrates considerable lengths of wire with great rapidity. A larger Leyden battery is in course of construction, to consist of thirty wide-mouthed carboys, each holding ten gallons.

IS AMMONIUM A METAL?—Landolt has made some experiments towards the determination of this question. Starting with the well-known fact that potassium or sodium-amalgam will throw down most metals from solutions of their salts, he argues that the ammonium-amalgam, if analogous, should do the same. Freshly prepared ammonium-amalgam was placed in the metallic solution, the separated mercury was washed with water, dissolved in nitric acid and examined for the metal whose solution had been used. The result with cupric sulphate, argentic nitrate, and ferric chloride solutions was entirely negative, though at least 100 grams of the amalgam was employed. While therefore NH^4 combines as such with the mercury, its metallic character is doubtful; further researches only can decide its nature.

HUXLEY ON COMTE.—In a recent lecture Professor Huxley made use of the following language:—"In so far as my study of what specially characterizes the 'Positive Philosophy' has led me, I find therein little or nothing of any scientific value, and a great deal which is as thoroughly antagonistic to the very essence of science as anything in ultramontane Catholicism. In fact, M. Comte's philosophy in practice might be compendiously described as Catholicism minus Christianity."

THE POLAR STAR.—The pole slowly shifts its position, so that in 12,000 years Alpha Lyrae will be the pole star. The inclination to the horizon of the entrances to six of the pyramids of Egypt is such that at about the time the pyramids were built, the entrances pointed directly to Alpha Draconis, which was then the pole star.

THE LATEST THING IN BATTERIES.—Böttger proposes to substitute metallic antimony for carbon. An amalgamated zinc plate is immersed in a strong solution of salt and sulphate of magnesia. The antimony, as was the case with the carbon, is placed in a porous pot; but the liquid used is dilute sulphuric acid.

Farming and Gardening.

Cherries.

The cherry has ever, in all ages, been recognized as the favorite among small fruits. It is cultivated in all temperate climates. It is of Asiatic origin, and was introduced into Europe by the Romans, during the first century of the Christian era. At that time only eigbt varieties were known; now the catalogues record over 500 ; many of these so-called varieties, however, are so nearly alike as to show very little variation in either size, color or flavor.

ITS CULTIVATION.

Years ago the cherry was a very healthy and productive tree, especially in England, wbere it was very extensively cultivated. Less tban one hundred years since this fruit waa cultivated as easily and with as sure returns as the apple; and it is even within the recollection of the present generation that tbe diseases which so severely afflict the tree have become general. The lack of success in this cultivation is now generally attributed to over cultivation ; the trees are killed by kindness—they are too highly manured. The cherry tree seems to be peculiarly susceptihle of heing forced in growtb. This excess of growtb, like over-stimulation in man, results in a diseased system—the tree becomes tender and diseased, and in a short time ceases to produce frnit, and dies. Disease shows itself by a burstiug of the bark, and exuding of gum from every wound. Warts also sometimes appear, and do considerable damage. When tbe tree is in such a condition it readily succumbs to drought, or excessive moistnre, and, in cold climates, to the severity of winter.

Wben tbere is reason to believe the tree is sufferiog from the causes above hinted at, it is a good plan to sow the cberry orchard with grass. Experiments of that kind have been found very successful at the East.

Especial care should be taken to procure healthy stocks. Bnd or graft only into sucb stocks as are known to be healthy. Tbe cherry is a difficult fruit to graft; grafting, if practiced at all, should be done very early in the season, before the buds start in the least. Make a clean cut—not a mere *split*—in tbe bark of the stock. Budding is preferable, and more reliable tban grafting.

The cherry appears to do better in the virgin soil of California than in the older lands at the east, whicb require highly stimulating manures to keep them in good condition. The climate of this State, also, seems to have a peculiar influence in changing the character of this fruit. This is also true of other fruits, particularly the apple.

The cherry season commences here about the first of May. The varieties grown bere are enumerated by the *Bulletin*, as follows:

The Black Tartarian, which, early in the season, will sell for 60 to 75 cents per pound by the box, and retail at 75 cents to $1. The Royal Ann, classed as a white cherry, with ruddy sides, a handsome, firm-fleshed, luscious fruit, comes later in the season, and sells at 40 to 50 cents by the box ; retail at 50 to 75 cents. The Mayduke is a handsome, bright red cherry, of medium size and fine flavor, is more grown than any other variety, and sells at 18 to 25 cents by the box, and 25 to 35 cents at retail. Coe's Transparent, a fine variety, brings 25 to 30 cents at retail. The above are the principal varieties. There are other varieties, as the Black Eagle, Bigarreau, Holland and Napoleon (one of the best for shipment, of a light color, firm flesh and an abundant bearer), the Vanskike, Kentish (for cooking), Gov. Wood, etc. ; each having their admirers. The largest growers are Robinson, Dr. Haile, William Meek, Lewellyn, Crane and Martin, of Alameda; Thompson of Suscol; New Park Farm and L. A. Gould, of Santa Clara, and others whose names do not occur to us at the moment. The fruit deserves larger cultivation, as it requires but little care. is an abundant bearer, sells at a high price, and will bear transportation to considerable distances. No fear need be entertained of overstocking the market, as the market will grow as fast as the trees are likely to be cultivated.

Bedding for Horses—Stable Disinfectants.

Quite too little attention is paid to the comfort and health of horses in tbe stable. Nine-tenths of the diseases which happen to the boofs and ankles of tbe horse, and many other ailments also, are occasioned by standing on stone or plank floors, or in wet, dirty stalls. A horse will soon get tired of stauding on a hard floor; so will an ox, a cow, or a sheep. All animals, as well as men, like a dry, soft bed, and they should have it. Nature designed the hoofs of animals for soft surfaces, which should be slightly moistened during the day, hut as dry as possible at night. In their wild atate, in tbe woods and valleys, they always provide themselves with such comforts ; and man generally does well when be seeks, so far as is reasonable, to imitate uature.

STABLE FLOORS.

When the materials are couvenient. as in tbis city, three bushels of sifted coal ashes, mixed with two of good lime, aod made into stiff mortar with tar or liquid asphaltum, the whole spread on a level hed of small stones, well rammed down, makes as good a floor for a stahle as can be devised —better than planks. Tho question of stable floors is deserving of more attention than it generally receives.

BEDDING.

Hay or straw is unfit for bedding, unless entirely removed, and fresh material put down every day. Sawdust is decidedly better, as by proper caro it need not be entirely renewed every day. Put it down, in tbe first instance, from six to nine inches deep, and take off the damp and soiled surface every morning. spreading evenly over the mass a thin covering of fresh material. The entire bulk need not he removed ofteuer than once a month. Sawdust is friendly to tbe feet, affording them a cool, porous stuffing, an excellent substitute for the fresh soil, always found in the hoof of a borse at grass. It has also the advantage of heing uneatable—a most important consideration witb horses in the habit of consumiog their litter. Its slight turpentine odor is also a sweetener to the mass, and rather a disinfectant tban otherwise. Where manure is salahle, tbat fact gives additional value to sawdust, as the best attainable absorbent of ammonia. Pine sawdust is altogether preferahle; oak is the poorest, as it contains a fermenting principle, decidedly injurious to bealth.

Many prefer sand to sawdust, especially for use in warm weather, as it does not heat; it is also very cleanly. Heated hedding is decidedly bad for boofs. Spent tan-bark also makes an excellent bedding. At all events, give your horses, and all othcr animals, a dry, soft bed; and in cold or wet weather, a good warm shelter. Food eaten under such circumstances produces more fat and more muscle, than when fed in improper places.

STABLE DISINFECTANTS.

Every farmer and every stable-keeper, would save money and better the condition of his animals by a reasonable use of disinfectants, to take up aud "fix" the ammoniacal vapors which always rise from wet stahle floors, litter or manure. Nothing is better for this purpose than ground gypsum or plaster of paris. Where this can be obtained cheaply it should be used freely every day, and when manure is valuable, it will nearly or quite add its cost to that product. Dry peat is perhaps the next best material for that purpose. In the lack of both, a stiff, dry loomy soil answers a good purpose. Soil is a great absorhent, as those who have noticed the recent writing's on dry earth-closets, are well aware. Soil which contains a large portion of clay, intimately mixed, is the best for sucb use. There is more philosophy in a well constructed stable than most people are aware of.

Feeding Stock—Ground Hay.

Quite too little attention is generally given, by farmers, to the method of feeding their animals, and to the character of the food placed before them. The fact is seldom brought to mind that it costs quite as much to provide food for the animals in the United States, as it does to feed its entire population; if it *was* so brought to mind the question proposed would be received as one of the most importanq economical considerations which could engage the attention of the farmer. A aaving of teu or even six per cent. in this direction, would amount to millions annually.

Onr attention has been particularly called to the subject at this time from the following item from the published reports of a late meeting of the Farmer's Clnb of the American Institute, of New York :

GROUND HAY.—Mr. Joseph S. Kirk, Pittsburg, Pa., forwarded a specimen of ground hay and recommended it as food for cattle. He says ten tons a day can be prepared at a cost not exceeding one dollar per ton. After passing through the mill, it resembles ground oats and weighs from thirty-two to thirty-four pounds to the bushel. Mixed with corn or other grain, it makes a cheap and excellent food. He wished to know the relative value of good, bright hay as compared with oats of equal weight. In reply, a member said that three pounds of hay are equal to one of oats.

Much has been said both *pro* and *con* on the question of cnttiug feed for stock. Those who disapprove of the cutting process, hold that it is a provision of nature that animals should take their food slowly, and spend much time in chewing it—especially ruminating animals. They point to tbeir plentiful supply of molars ; to the lahyrinthian convolution, and honeycombed appearanco of the digestive organs of the ruminaots, by which their food is turned and rolled, after heing swallowed, and triumphautly argue therefrom that bay-cutters and all such modern contrivances are nuisances ; that they dehauch the animal's stomach aud call for useless labor in the preparation of food.

Such people, however, forget that there is a difference between animals in a state of nature, who have an abundance of time to to eat slowly, chew the cud at leisure, and sleep when all is done—with no work to interfere, and those which are domesticated. When it becomes necessary that man should abridge the time of eating for animals, it follows as a matter of course that he should provide some compensation for his interference with nature's laws ; this he does by providing machinery to partially disintegrate the food hefore it enters the stomach.

The object of masticatiou is to comminute tbe food—to so break down its structure as to render it more easily acted upon by gastric juice. If the animal lacks time to do this for himself, man must assist him. If "cutting" thus aids nature, "grinding" will do so still more. Tbere is no danger of inventing machinery to cut or pulverize food too finely for working animals. The more finely divided it ia, ao much the more surface is presented to the action of the digestive fluid, and the sooner the animal is through with his meal, aud in a proper condition to get the rest and sleep which he needs. It is useless to point to naturo when we break nature's laws at the start. The best possible evidence in favor of cut food is the comparative results shown when it is employed by the side of food that is uncut. When results show a farmer that 10 pounds of cnt food is uniformly as nourishing as 15 pounds of uncut, lectures on anatomy will not convert him to the opposite opinion.

FLAX SEED FOR HORSES.—It is said that flax seed occasionally given to horses or cattle, will make them shed their old hair, and whether old or young, soon get sleek and fat. It is the only thing which will fatten some old horscs.

The Garden.

It is a matter of astonishment to us that so many of our farmers manifest an almost perfect indifference to a garden. There is no estimating the saving whicb may be effected by the proper culture of such a piece of ground. Every farm should have its garden, and every household too, wbich is so situated that such a convenience is within reasonable reach. There are few things as useful, in making farm life attractive, as a well-laid out and well-tilled garden. There should be flowers there, as well as fruit, and all kinds of berries; choice vegetables, also, such as asparagus, celery, egg plants, lettuce, etc. Such tbings are healtbful as well as palatable, and no farmer should deprive his family of them, or neglect to provide them. They cost next to nothing. They occupy but little room, and the time required to care for them may be taken out of odd hours, when tbe farmer or his "help" or boys, are waiting for a team, or bave an hour to spare before going to some place—bours which would not be spent in the field, anyhow, and which, hut for the garden, would be lost.

In this country, where tillage is ao much easier than it is in the Atlantic States; where the weeds have not got well seeded, and where tbe soil is rich and generous, farming is easy, and the husbandman haa much more time on his hands than he has been accustomed to fiod in the Eastern States—an abundance of time to attend to his garden, improve his mind and to cultivate tbe social relations. It furnishes rational, healthful and useful occupation for the boys, and girls, too. It is an ornament to any home, and a comfort, convenieuce, and cheap and innocent luxury to any family. It makes a man love his home, and it vastly increaaes the attractions of home for the children. A well laid out garden, provided witb choice fruit trees and berries, will add more to the value of a homestead than the same amount of money can possibly do expended iu any other manner.

The moral influence of the garden is also an important consideration. Its care fosters habits of industry among the boys, and there is something in the very aspect of such a place well calculated to sooth irritated feelings, to promote peace of mind, to encourage patience, perseverance, thought and care. Graceful trees wave a welcome to incoming footsteps, flowering plants seem to smile upon the passer-by, and fruit-laden boughs drop their rich, ripe products into tbe hands, as if to reward them for their pains-taking care. Some one has beautifully said, "A garden is a place of healing for the soul"—

> Yes! in the poor man's garden grow
> Far more than herbs and flowers;
> Kind thought, contentment, peace of mind,
> And joy for weary hours."

The Crop Prospects.

There has been a marked change during the past week, in the tone of the interior papers, with regard to the crop prospects. The gloomy forebodings of a week ago bave generally given way to pleasant anticipations. From almost every section of the vast grain fields of the State, we receive assurances that a bountiful harvest will be reaped in due season; the exceptions are very few and of unimportant extent. The *Bulletin*, of this city, has seen a private letter from a farmer at Rio Vista, where it was last week reported the rust was working serious damage, which says : "I have not heard of a particle of rust within a circuit of twenty miles; and I should be very likely to hear of it if there were any. We have considerable north wind in this vicinity; but thus far no particular damage has been doue. We regard our crops as secure beyond almost any contingency. In the favored sections our wheat will yield forty bushels, and our barley fifty bushels to the acre."

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

San Francisco, June 5, 1869.

Financial.

Our money market is much easier than for some time past. The stringency which bore so heavily upon us is passing away, and we are returning to our accustomed regularity. Deposits in banks and saving and loan societies are more numerous as well as in greater volume. Rates of interest are 1¼@1½ for best commercial paper, for business purposes. Speculative demands are not in favor, and are not as freely supplied as heretofore. Bullion is in fair supply, and gold bars range from 880 to 890, silver bars are quotable from par to one-quarter per cent. premium; currency bills on Atlantic cities pay 35 per cent. premium on gold; coin drafts pay 1⅜ per cent. premium; telegraphic transfers, 2 per cent; sterling exchange, 48¾d; commercial exchange, 49¼d; Mexican dollars command a premium of 5⅜@6⅜ per cent. Gold in New York June 3d, 138¼. Legal tenders, in San Francisco, 73@74.

The cessation of yield from the Gold Hill mines, caused by fire, has reduced our supply of silver bullion as compared with last year's return. It is singular to note the apathy felt for the White Pine region in California as compared with the energy and activity displayed by the business men of Chicago. It is said quite two-thirds of the bullion extracted from those mines goes directly to Chicago. White Pine is admitted the richest silver region ever yet discovered, and we cannot afford to ignore the fact which is too prominent for contradiction. This diversion can only be temporary for the Oriental countries are the great consumers of silver, and the inexorable laws of commerce demand that it shall find its way there by the most direct route and in the shortest time. Neither Chicago nor all the East combined can successfully arrest the silver stream for any continued period.

In reference to the Salt Lake trade it may be justly asserted that the "game will not pay for the candle." Gentiles are only allowed to trade on sufferance, and are heavily taxed by Mormon rulers. Brigham Young and his crew have seized upon all the lands about Ogden, and hold a monopoly of all the business and accommodations at that point. It is high time that the Government should step in and do something to protect the interests of other parties besides the Mormons. Not satisfied with being let alone they are becoming aggressive, and unless the matter be taken vigorously in hand at an early day serious trouble will ensue.

At the close of business on the 31st of May the following was the condition of the City Treasury:

Gold	$220,000 00
Silver	18,000 00
U. S. Notes	8,529 15
Coupons paid but not catered	350 00
Demands on General Fund	19,671 11
Demands on Sinking Fund School Bonds 1860—not entered	1,060 83
Total	$267,580 09
On Special Deposit for Property Sold for Taxes	3,493 90
Loose Coin on Trays	6,441 25
Total	$277,515 24

Real estate transactions on a large scale were effected in the month of May last. *Carter's Circular* records 1,034 sales, representing $4,222,237 against 1,001 sales and $4,173,005 in April. The following table shows the transactions since January 1st, 1869:

Month.	Sales.	Amount.
January	492	$2,716,823
February	816	2,905,807
March	914	4,721,173
April	1,091	4,273,095
May	1,034	4,222,237
First five months 1869	3,057	$14,838,144

The number of mortgages effected in May was 370, representing $1,177,593, and the number of releases was 174 worth $693,367. But for the prevailing stringency during the month it is thought that the number and values of the sales would have been much larger. The southern counties are filling up with a steady and energetic population. Great activity prevails at Los Angeles, while even San Diego has doubled in size within the past year.

The Harbor Commissioners have made the following report of receipts and disbursements for the month of May last:

RECEIPTS.

Vallejo street Wharf	$2,109 50
Pacific street Wharf	1,327 00
Jackson street Wharf	740 00
Washington street Wharf	638 00
Clay street Wharf	1,019 00
Commercial street Wharf	934 50
Market street Wharf	44 50
La Rue's Wharf	382 00
Mission street Wharf	1,761 00
Howard street Wharf	1,084 15
Folsom street Wharf	1,750 00
East st. Water Front (Market to Pacific)	150 00

Sea wall account, amt. paid on account of contract with A. H. Houston and salary of engineer	41,835 22
Total	$79,742 04

The Exports of Treasure from June 1st to date, have been as follows:

June 1—Per Golden City—	
To New York	$ 87,524 81
To England	668,963 54
To France	7,000 00
To Panama	20 000 00
	$ 784,488 35
Previously this year	15,950 199 98
Total since January 1st, 1869	$16,734,679 33
Corresponding period, 1868	16,686,090 04
Increase this year	$ 58,589 29

The duties paid at the Custom House, in this city, from May 28th to date have been as follows:

May 28	$14,134 18
May 29	9,210 35
May 31	4,839 13
Previously in May	546,746 58
Total in May	$575,030 24
June 1	33,271 14
June 2	39,148 31
June 3	11,578 56
In April	534,892 05
In March	260,447 40
In February	602,340 00
In January	532,997 97
Total since January 1st, 1869	$3,129,695 67
Corresponding period, 1868	3,440,645 56
Decrease this year	$310,949 89

The heavy drafts made upon English funds for foreign loans have created some feeling of uneasiness in the London market. The reserve in the Bank of England on the 8th of May was only £6,504,995, against £11,948,107 same time last year, and the stock of bullion has been reduced from £20,402,992 to £16,582,068, a decrease of £3,820,924. Losns to the extent of $250,000,000 have been negotiated, and several other applicants are in the market offering their paper at heavy discount. Spain issued £50,000,000 of bonds to realize $14,000,000 in money. The financial condition of nearly all European Governments is very unsatisfactory. Business in England had revived somewhat, and Russia is making great progress in the construction of railroads.

City Stocks.

During the week under review we note very considerable sales of Spring Valley Water Co. stock at $66@65 75 per share. The usual ½ per cent. dividend will be paid on the 10th inst. A few shares of San Francisco Gas Stock changed hands at $81@80 per share. This company disbursed its usual monthly dividend on the first inst. The Sacramento Gas Co. also paid its usual monthly dividend on the first inst. North Beach and Mission R. R. Co. paid its usual dividend on tbe first; also the Pacific Bank. The Merchants' Mutual Marine Insurance Co. will dishurse its usual monthly dividend on the 10th.

Mining Share Market.

Business at the stock exchange bas been less active during the esrly part of the week than for some time past, but toward the close transactions were more numerous, tbough prices did not show any improvement.

Tbe aggregate sales in tbe San Francisco Stock and Exchange Board, during the month of May, for a series of years past, hsve been as follows:

May, 1864	$1,688,285	May, 1867	$7,651,855
May, 1865	9,865,549	May, 1868	10,162,396
May, 1866	3,052,102	May, 1869	6,961,913

The total sales during the first five months of the past six years have been as follows:

In 1864	$13,524,857	In 1867	$24,249,002
In 1865	14,733,324	In 1868	52,435,009
In 1866	18,868,761	In 1869	35,965,647

Hale & Norcnoss—sold to a considerable extent at a decline. During the week ending May 29th, 1148¼ tons of ore were extracted, nearly all coming from the fourth and fifth stations. During tbo same time, 1549½ tons were delivered to the mills, leaving 947¾ tons on hand. The old shaft is now sunk and retimbered down to the 400 level, and during the present week they will commence opening a station at that level. The drift on the 300 level has reached the vein and developed a fino body of ore. They have raised up 55 feet from the 300 level, and made a connection with the old Santa Fé level, which ventilates the 500 level. On the eigbth floor of the 175 level, developments are reported to look well. In the new mine they have discontinued hoth raisés in the second station until air connection is made with the Chollar-Potosi ground through the south drift on the fifth level, the connections heing nearly made. On the third and fourth levels the breasts are said to look well.

Chollar-Potosi—rose to $470 per share, but at the close shows a large recession. The ore extracted during the week ending May 28th amounted to 1,680 tons, the Blue Wing locality yielding 600 and the New Tunnel 580 tons of the amount. Tbo quantity sent to the reduction mills during the same time aggregated 1,306 tons. The drifts running west in the Blue Wing ground are developing a large amount of ore, and latest advices show a continued improvement. The extreme ends of the New Tunnel stope are improving, and at the north the ore is 28 feet wide, and no wall to the west. In the Grass Valley tunnel there is every evidence of a large body of good milling ore, fair average assays of which are reported to show $100 to tho ton. On thc 28th of May they sent forward $28,858 in hullion. Five mills are now employed hy this company. A dividend of $15 per share was declared on the 3d, payable on the 5th inst.

Gould & Curry—exhihits a slight improvement. They extract about fifty tons of ore from the upper works, assays showing as high as $44 per ton.—Ophir is quite active at some advance. The drift had attained a distance of 324 feet on tbe first inst.—Imperial shows a recession. No change in the south drift. Tbo shaft has been carried to the depth of about 25 feet below the 1,100 level.—Daney levied an assessment of $1 50 per share on the 29th of May.—Julia levied an assessment of fifty cents per share on the 27th of May.

Train has held forth and hss had full sway in San Francisco. He is poohpoohed by the heavy dailies, and by individuals of the heavy sort who are accustomed to hold the reins of the community. But Train is nothing like our theatrical bores, nor what would be called a "fizzle." He has struck on many a thing in which there is more truth than poetry.

Weekly Shareholders' Directory, for Meetings, Assessments and Dividends.

[Compiled for every issuc, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Watering Locomotives upon the Run. *The Engineer* ssys the express trains between London snd Liverpool, 200 miles, will heresfter make the trip in four hours. Water is to be supplied by the water-trough and scoop. The tank on bosrd will hold 400 gallons; sufficient to last 15 miles,—the distance between the troughs. At least five miles perhour is saved by this arrangement in the matter of stoppages, to say nothing of the fact that the great waste of power required to draw the enormous tender which would otherwise be necessary,—is avoided.

Now that this scoop plan is admitted to be a good one, the English journals as usual give an English inventor the credit. The *American Artisan* quietly calls attention to page 708 vol. I of the Patent Office Report for 1854,—where is recorded the fact that Angus W. McDonald, of Virginia, is the man to whom the credit should be given.

Quakings.—The Santa Cruz and Gilroy papers speak of recent earthquakes, that were not felt in these parts; and the tide gauge at Fort Point recorded an earthquake wave on Wednesday, which came we know not whence.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

PENNSYLVANIA.—*Chronicle*, May 22d: The ledge bas been cut through in the north drift. The solid portion of tbe ledge is ten feet wide. In the south drift the ledge has been cut 6½ feet. Here the ore is better, carrying ruby silver. Secretary Johnson has taken one ton of average ore to Nevada to be tested.

GLOBE.—*Miner*, 22d: This tunnel is now in 220 feet and pushing as fast as five men can force it.

MOUNTAIN No. 1.—We hear from this tunnel that the rock is harder than ever. Giant powder is again to be resorted to.

MORNING STAR.—We have been shown a letter contradicting tbe reports in regard to frauds in the management of the company's affairs. The incline is now down 50 feet below the bottom of the main shaft, and a drift commenced to cross cut the lode. Some good ore is found and indications are flattering.

AMADOR COUNTY.

CASCO.—*Ledger*, 29th: The shaft on this mine has reached the depth of 526 feet, with small streaks of quartz coming in. They will commence drifting immediately, north and south.

Dr. Gwin's mill will be ready for operation in about ten days. The mine is located about five miles from Jackson, on the south side of Mokelumne River.

VOLCANO.—We learn that placer and hill mining in and around Volcano, is paying as well this season as at any previous time. The Amador Canal Co. are selling all the water they can run down....The claim at the mouth of Red Gulch, owned by a company of Italians, is averaging about $1,000 per week.

PINE GROVE.—Correspondence of same: The Anaconda is raising some of the richest rock ever taken out of that mine..... The old Sorocco mine has changed bands. The company is incorporated; capital stock $360,000. I understand it is the intention to commence retimbering their shaft preparatory to sinking.

CALAVERAS COUNTY.

PALOMO.—*Chronicle*, 29th: The steam hoisting works are completed, and work has been commenced. The Palomo is now supplied with all the appliances for quartz mining.

EL DORADO COUNTY.

THE INDEPENDENCE.—Placerville *Democrat*, 29th: A fine mill of 12 stamps, run by water, was erected 18 months ago, and the rock has continued to pay handsomely to the present time. Mr. Henson has thoroughly prospected the two lodes claimed, and is now sinking upon one. He exhibited a prospect, about 25 cents in free gold, which be panned out of a few handfuls of decomposed rock from one side of the lode.

NEVADA COUNTY.

UNION HILL.—Grass Valley *National*, 23d: We saw to-day a lump of gold worth over $4,000, from the Union Hill mine. It was the result of ten days' run. Part of the time 15-stamps were employed, and the rest of the time only 10.

CLEAN UP.—Ninety-two loads of rock from the mine of Gregory & Mansau, Osborne Hill, recently crushed, yielded over $4,000.

NOTH STAR.—Same of 25th: About 85 tons of rock from the level, No. 6, west, just crushed, yielded $70 to the ton. Supt. Crossman informs us that the ledge is over three feet thick at this point.

IDAHO.—This mine continues to pan out with the regularity of clock-work. Gold bricks to the value of $6,000 were shipped to San Francisco last night, the result of a two weeks' run.

BOWERY.—At this mine they are sinking an air shaft, to be 80 feet deep, and three in diameter. It will be completed in about three weeks. The ledge is from six inches to a foot in thickness, and looks well.

GREENHORN.—Same of 28th: This ledge, five miles from Grass Valley, was leased by A. S. Cook & Co., in April, for five years. An incline bas been run in on the ledge 60 feet from the surface. They are now drifting and will take out a crushing in a few days. The ledge is from four to five feet thick, well defined blue rock, and shows well in gold and sulphurets. One blast threw out $200 in specimen rock.

CRESCENT.—Active operations were commenced March 1st, by an incline shaft on the ledge 140 feet. From this point a drift has been run south 100 feet. The ledge is eighteen inches thick, and shows well. The company have been using a whim thus far, but it is their intention to put in a 6-inch pump, and an engine of sufficient power to prospect to a depth of 400 feet.

JOHN BRIGHT.—Same, 29th: The mine near Ione has been prospected to a depth of only about 75 feet. From a crushing of 80 tons just made, a yield of over $1,900 was the result. The ledge will average a foot in thickness.

CLEAN-UP.—The claims of Cal. Kirtley, on Diamond Creek, were cleaned up on Wednesday, after a run of nine days, and yielded $590. He had three men employed, and the water bill during the run was $132.

EMPIRE.—*Union*, 28th: There are some twenty hands at work at the mine, and matters are progressing favorably. The miners use only the single hand drill and Giant powder, and each man takes up one ton and a half of quartz per day.

EMPIRE.—29th: Each stope has a foreman, who charges and fires the holes, and who goes in first after the shot is fired. The men who drill, do not see, handle, or smell the powder. Capt. Lee has tried to get his full complement of miners, but so far has not succeeded. There are several young men employed who have never been considered miners. They went into the drifts just to show that they would go where somebody else said they should not. Aaron Burr, with a single hand drill, made nine and a half feet in hard rock; and Joe Lougee, aged 17, put down thirty inches in two hours and a half. This would have been quick work for two men with the old style of drill.

MINING.—Same of 30th: At the Eureka and Idaho work is being prosecuted as usual....The Empire has not been able to secure a full complement of hands, but the men do very well with single-hand drills and giant powder. On Friday last the 18 men took out over a ton of quartz to the man....At the North Star matters remain as before the strike. A few men have applied to work, but always wanted the new powder ruled out. The members of the Miners' Union seem determined not to work unless they can dictate on the powder question....A. J. Cook & Co., on Greenhorn Creek, have taken out some fine rock. We saw specimens filled with beautiful gold. The ledge is large, and a crushing is now going on at Laton's mill....The Wisconsin mine is yielding fine looking rock.

SAN JUAN.—*Transcript*, May 27th: The Eureka Lake Ditch Co. are washing on San Juan Hill. The result of said labor is, as a general thing, kept secret, but its claims are said to be paying well. Most of our claims are idle, their owners waiting for reduced rates of water. The Nort Bloomfield Co. is agitating the question whether to extend its ditch to this hill.

JONES' BAR.—Same of 20th: The cement mill removed from You Bet, by Fitzsimmons & Co., is completed. The storm increased the volume of water to such an extent as to interfere with taking out the cement. It is thought that the water will subside sufficiently to permit work to be commenced in a week or ten days.

STRUCK IT RICH.—Same of 30th: We are informed that the Illinois and Wisconsin have struck very rich ore. A small piece of rock taken out on Friday contained about $10 worth of gold. The specimen was very handsome, consisting of crystals of quartz and gold, with a very pretty piece of gold leaf in it.

RICH ROCK.—*Gazette*, 25th: Rich specimens of gold quartz have recently been taken from the claims of the West Idaho Company, on Slate Creek, an extension of the Eureka.

EUREKA MINE.—*Gazette*, June 1st: The mill was cleaned up Saturday, after six days' run, and yielded 1,936 ounces of amalgam, which will retort $6.50 an ounce. Four tons of sulphurets were saved during the run, worth $800. The company have 160 men employed in the mill and mine, and the pay roll for May amounts to $17,000.

IDAHO.—We saw two bricks yesterday worth $13,300—the result of one week's work of the Idaho, including the cleaning of the battery.

THE ROANNAISE.—We visited this mine yesterday, and were informed by the Superintendent, Wm. Watt, that the company are running a tunnel from the west end of the Eureka ground into the claim. They have completed 150 feet, and have yet 315 feet to run, which will require about three months' time.

PLUMAS COUNTY.

EAST BRANCH.—Correspondence of Quincy *National*, May 22d: There will be more mining in this vicinity this season than for years.....Hallsted & Co. are working some of the best ground they ever had. ....Sheiser & Co. have a good head of water, and will make a handsome clean-up. ....Hallsted & Bigarms have good prospects....Cole, Wright & Co. are still drifting in 12-Mile Bar Hill....Cole & Knucky are making preparations to work the river claim which they bought from Mr. Ward last summer.....Mr. Ward intends flumiug the river in two places this season, and is making extensive preparations. One flume will be opposite Hardsock Point. The other about a mile below 12-Mile Bar..... A very rich strata of gravel has been found in the lower part of 12-Mile Bar by C. W. Hyde....Johnson, Mercer & Co. are waiting for the river to fall. The company have been at a large expense in cutting a bedrock race....The water stills bold out in Rich Gulch, though the bead is getting small. McBeth & McNealy have had a longer run than they anticipated. Judging from the prospects they will make a good clean up; as well as Captain Corser in the claim below.....An undertaking long talked of has been commenced by Covolt & Co., the cutting of a bedrock flume in Rich Gulch.

SAN DIEGO COUNTY.

Incumba Valley correspondence of the *Union*, March 26th: Mr. Walker, of San Diego, has been prospecting with very flattering success; as he discovered silver mines six or seven months since, and has recently been investigating the same. There are several ledges, viz: the Rattlesnake, Ophelia, Zach Taylor, Eliza and Pocahontas. All of these we believe will pay well, as the indications are of the very best.

SISKIYOU COUNTY.

COTTONWOOD QUARTZ.—Yreka *Union*, May 29th: Work on the Norfolk and Lodi ledges by the Merritt company is still being prosecuted with the same gratifying results as heretofore. Many other claims in the neighborhood are being taken up and work commenced.

QUARTZ MINERS WANTED.—At present the demand in this vicinity for experienced quartz miners is greatly in excess of the supply.

TRINITY COUNTY.

GOOD CLAIM.—*Journal*, 29th: A nugget weighing eight ounces was found by Messrs. Ritter & Dack, on Little Creek, on the 21st. The yield from this claim has increased since the commencement of the season, from six to fifteen ounces per week.

Douglas City letter: The mining season is about finished, so far as sluicing is concerned; and in a week or two most of the companies will commence on the bedrock. Generally speaking, it has been a favorable season for so short a one.

Junction City letter: Sturdivant & Whitmore have closed a bargain with the Sheridan Bros., for their claims, etc., at Arkansas dam, paying $5,000, to take possession as soon as the claim is cleaned up. S. & W. are getting out timbers and lumber with which to erect an extensive hydraulic. Jacob Hager & Co. are piping at a lively rate, with every prospect of making big money. On Oregon Gulch the miners are all in good spirits, and without doubt all doing well. On the other side of the river Grover & Co., Peters & Weise, Jacobs & Lorenz, and, in fact, all the companies are still at work, although water is getting quite slack. Most of them will commence cleaning up this week. At Park's Bar prospects are flattering. H. C. Wilt is pushing things, and the hydraulic is kept running night and day. He has been to an expense of $9,000 in rigging the claim this year, but the yield will be nearly $20,000.

YUBA COUNTY.

U. S. GRANT MINING CO.—*Appeal*, 27th: The Jefferson mill and machinery is being removed from Brown's Valley to the site of the Grant mine, a mile or two east of the valley.

ARIZONA.

HASSAYAMPA PLACERS.—Prescott *Miner*, May 8th: The diggings on the upper Hassayampa continue to pay. Every miner on the creek was making from $4 to $10 per day. Some 20 Mexicans are at work in the gulches. Saturday, one of them found a piece weighing $20.

WALNUT GROVE.—Mr. Lambertson was getting ready to work Mammoth ore in his arastra....Mr. Cullember intends soon to commence work upon the Josephine, a rich gold ledge.

BLACK CANON.—Tom Bodkin and another man arrived last week with considerable dust. They talk of returning....The Mexicans in the gulches adjacent to the Chase mine are doing well.

THE STERLING.—The work of tearing out the rotten timbers in the battery bed and replacing them with new ones is almost completed, and everything is in readiness for the new machinery, which is expected next week.

THE CHASE.—Same of 13th: A. O. Noyes and George Lount are experimenting with the Paul & Wood process.

Hinkle & Baker are sinking on their lode, near the Chase, and getting fine looking ore.

WALKER'S DISTRICT.—The Eureka mill was running, and Mr. Graves was roasting the crushed ore in his pipes. The ore yielded twice as much gold as while raw. ....Bowers & Bean are preparing to put a large flume in the bed of the creek. They have located two miles of the bed and banks.

Mohave City correspondence of *Herald*: Stephen Otis is working the Ticbatticup mine in El Dorado Cañon. He has about 20 hands employed, and a large amount of ore at the mill, which will pay $100 per ton. The mill has been stopped for repairs.

Wade & Co's mill received a new boiler a few days ago, and will now soon be started again, to work ore from the Mitchell lode, in the San Francisco District.

COLORADO.

BULLION SHIPMENT FOR APRIL.—Georgetown *Miner*, May 13th: Huepeden & Co., 4,441½ ounces; value in currency $5,101.14. Stewart's Reduction Works, 5,544 ounces; value in currency $6,384. Brown Co., 560 pounds; value in currency $11,000. Total, $22,485.14.

TERRIBLE.—We have paid a visit to the mine. The ledge is a large, well-defined, true fissure vein. In all the levels we saw rich ore, sparkling with brittle ruby and native silver. The tunnel, 540 feet below the shaft house, is driven 60 feet. It will strike the vein 290 feet from surface. We saw at the mine ten tons of first-class ore, worth $500 per ton, and 1,000 tons second class ore worth $80 per ton. Both tunnel and mine are worked night and day.

CLIFF.—Same of 20th: The main shaft is 100 feet deep. A level has been driven 120 feet on the vein. At the end of this a cross cut has been run showing the ledge 21 feet wide between permanent walls. The ore vein on the north wall is two feet wide; eight tons of first class ore at the mine, worth $475 per ton in coin, 100 tons of second class ore worth $75 per ton.

LAUREL.—A new discovery by Kennedy & Hill, on Sherman Mountain. The shaft is 14 feet deep, showing a crevice four feet wide between smooth walls. Select ore assays $410 per ton in coin.

GRIFFITH.—The main shaft has reached 127 feet; the air shaft a depth of 65 feet; the first level has been driven east 118 feet. Work pushed vigorously. Six hundred tons first class ore already raised; worth $200 per ton in currency.

STRIKE IN THE BROWN MOUNTAIN.—The Colorado Co. struck the lode 36 feet in. They have passed through four feet of crevice matter, and no north wall yet can be seen. Hon. Carver J. Goss laid on our table several rich specimens. There was no indication of this lode on the surface.

NI-WOT MINE.—Boulder *Pioneer* letter, May 19th: Drifts are being extended on the lode, east and west, and "backs" opening for stoping. The vein is a new one, probably the main one of the lode, and in a short time sufficient ground will be opened to keep the fifty stamps constantly going.

NEW YORK MILL.—Central City *Herald*, May 12th: Twenty new stamps have been put up, and the frame work of 20 more rebuilt. The mill has now 55 stamps, and can crush from five to six cords, or about 45 tons of ore per day. The engine has been taken out and water-power used.

Terrell & Co., on South Clear Creek, just below the old Freas claim, took out ten ounces of gold last week; only two men working.

Woodbury & Co. cleaned up 32 ounces of gold from one cord and a quarter of German ore.

The Consolidated Gregory mill has made a forty-eight hour run on ore from the Fork's lode, and cleaned up ten pounds of amalgam, from the batteries alone. Only 25 stamps were running.

IDAHO.

GOOD CLEAN UPS.—Idaho City *World*, May 20th: During the week, Noble, Elkin, Saunders and Wood have made three clean-ups, with an aggregate product of about $11,000. Two were in the claim on Buena Vista Bar; from these the product was above $6,000. The other was in the claim on the hill; the product was between $4,000 and $5,000. There are two gangs of five men each in the claim, who run it day and night without cessation. The company are also running three or four other hydraulic claims along Bonum Hill. They have taken out about $40,000 since March.

COSMOS MINE.—Owyhee *Avalanche*, 29th: This mill is undergoing thorough repairs. The Superintendent informs us that he will be ready to start about the 20th of next month. He intends to commence on Silver Cord ore.

NEVADA.

REESE RIVER.

Hot Springs.—An Anrora letter of May 23d, to the Sacramento *Union*, says: Over 100 pounds of bullion were brought in from Hot Springs. Thomas Shaw and associates sold the Gold Mountain mine, about 20 miles southeast from Palmetto, to parties in San Francisco, for $32,500.

Specimens of rich rock were brought in here last week from the Dunderberg ledge, in Castle Peak District. The Company are running a tunnel to strike the ledge at the depth of 200 feet. The tunnel is now in over 500 feet, and they are expecting to strike the ledge every day.

WASHOE.

[The latest items of news and information from this district will be found on another page.]

Hale & Norcross.—*Enterprise*, 25th: This mine is looking particularly fine. A number of new and excellent bodies of ore have been found both in the old and new works. Some of these seem to have been strangely overlooked during former workings.

Started Up.—May 27th: Evans' mill, in seven-mile Cañon, started up last Wednesday on Sacramento ore.

Occidental.—The new tunnel is progressing. The rock is softer. There is a slight increase of water. The tunnel will tap the vein 400 feet below the present lowest workings, following the dip, and will be a perpendicular depth of 300 feet below the present lower level.

Hale & Norcross.—Same of 30th: From the 1,000 foot level they are running a drift to connect with a similar drift that is being driven towards them from the Chollar-Potosi. The ends of the drifts are now so near to each other that the workmen in each can hear the sound of the picks in the other.

Bullion Shipments.—The shipments of bullion for the week ending Saturday, May 29, were as follows: From Wells, Fargo & Co.'s office in Virginia, 4,523 pounds, valued at $118,790.35; from the office of the Pacific Union Express company in Virginia, 78 bars, weighing 4,051 pounds, valued at 110,795,90—making a total of 8,574 pounds, valued at $219,586.25.

Pappoose Mill.—A battery of four stamps is about to be put up. Heretofore it has been running on concentrated tailings, using six pans and working about 11 tons per day. As soon as the battery is up, they will commence reducing ore.

Gould & Curry.—All four of the compartments of the shaft are now being timbered to the bottom.

Bullion Mine.—The Bullion Mining Company have commenced drifting eastward from the 1,400 foot level. The ground is found to be so dry at this great depth as to be almost dusty. The blower furnishes a plentiful supply of fresh air. The drift is now in 30 feet.

Justice Independent.—This company have now drained their main shaft, and are sinking it to a greater depth. It will be put down 100 feet more before drifting. The rock is quite soft, and it is thought that this depth will be attained within the next 30 days.

Virginia Consolidated.—The new shaft has been sunk as far as practicable by hand, and temporary steam hoisting apparatus will shortly be put in operation.

Gold Hill.—*News*, 26th: A full force of hands is being worked on the Yellow Jacket mine, and the ore is tumbling out at a lively rate. The air is good throughout the mine. The Kentuck yields ore enough to run the Sunderland mill, from its upper levels. The lower levels are closed in order to hem the fire, which exists at the Crown Point line, in the east ledge. Drifting east at the 1,000 and 1,100 foot levels of the Crown Point, in order to strike the ledge and work beneath and out of the way of the fire, is being prosecuted. All the stations above there are also blocked up securely, in order to smother the fire, or let it burn itself out, just as it plenses.

WHITE PINE.

Our agent, W. H. M., sends us the following,—in continuation of his notes given in our last week's issue:

The Base Metal Range.—There are several promising mines still worked at Camp Babylon, among which are the Northern Light, Savage, and Homeward Bent. At the two last they are taking out very good ore. The Homeward Bent has had some eight or ten tons worked, which are said to have gone as high as $150 to the ton—without roasting.

White Pine Mountain.—The ascent is very precipitous; but when once on the summit, the view is delightful. We look down on the country from an elevation of 11,000 feet. The base of the mountain covers an area of about eight by ten miles of country. Some three or four sawmills can be seen at work; the mountain is quite heavily timbered. The cañon leading toward the summit is filled with prospectors. On the west side is the Monte Cristo and Cañon mills. Some of the earlier located mines have been jumped, because the two days' work required for the second year has not been done upon them. Some of the lodes carry very good base metal ore.

The first mines were located in Mohawk Cañon. The Casserly ledge, a recent location, shows a 3-foot vein of ore which will assay about $70. Several other promising locations have also recently been made in this cañon. It is the impression of many good judges that the mines here, (being of the base metal charactor) will prove more lasting and valuable than most others in this vicinity. There is talk of a 20-stamp mill being put up here. There are already some ten or twelve mines here which it is thought will yield all the way from fair milling ore up to $250 per ton in silver—oxide from copper and lead.

The weather here has been warm and pleasant for the past three weeks, the roads are in fair condition, and the mails arrive regularly.

Items of Progress.—*News*, 22d: The Chloride Consolidated is shipping to mill daily about 40 tons of ore of a remarkably high grade....A fine deposit of ore has been developed in the Bourbon at a depth of 20 feet....26th: Twenty tons shipped daily from the Nevada for milling ...The Rattler is incorporated and work progressing. At a depth of 44 feet the shaft was driven into a body of very fine ore, which has been already breasted a distance of nine feet from the shaft, and neither top, bottom nor side found to the mass, which is all high-grade ore...."In the Autumn mine, a pit or incline has been sunk to a depth of about 20 feet, and from 12 to 15 feet in width. Every pound of ore taken from this, from the top down, yielded, mill process, $350 per ton. Descending into the large chamber, we were absolutely bewildered at the wealth on all sides. Chloride and horn silver crop out profusely in almost every part."....28th: Aurora Consolidated is shipping daily to McCone & Dunn's mill 15 tons of ore, estimated to be worth $200 per ton....The Stonewall shaft of the Cbloride Consolidated Co. is 180 feet deep. This is the deepest on Chloride Flat. Good ore is met with at this depth, but not in as large quantities as nearer the surface....We learn that the Earl Co. yesterday sold their mine to San Francisco capitalists for $30,000. This company but recently struck ore in paying quantities.

Bullion.—*News*, 25th: The Agency of the Bank of California shipped yesterday between $19,000 and $20,000 in bullion, from ore of the Chloride Consolidated Co. ....26th: Wells, Fargo & Co. shipped from the office in Hamilton yesterday 10 bars, weighing 895 pounds, and valued at $22,568.40....28th: Wells, Fargo & Co. yesterday shipped one bar of bullion, valued at $1,221, the yield of five tons of ore from the Industry mine on Pogonip Flat.

Mills.—*News*, 25th: The prospects render it almost certain that we will have 138 stamps in operation by the 8th of July or sooner. If we can turn out $1,500,000 a year with 18 stamps, what can we give from 138?....The splendid 20-stamp mill (formerly Big Smoky) of the Treasure Hill Silver Mining and Milling Co., which has been put up at the lower end of Hamilton, was started up yesterday....The Monte Cristo mill is to be overhauled, and will soon be ready for work....28th: We learn that the owners of the California mine, southeast of Shermantown, are having a 30-stamp mill, with all the modern improvements, manufactured in San Francisco.

Outside Districts.—Patterson.—*News*, 22d: Jas. Hutchings writes us from Montezuma: "It is my candid opinion, backed up by ten years experience in silver mining, that this is the richest and perhaps the most extensive mineral bearing district in the State of Nevada. There is more rock in sight that will yield by mill process not less than $100 per ton in this district than has been produced by the Comstock during the last two years. Yet we are entirely powerless, for the simple reason that we have no mills. At present a great many of the boys are making good wages by roasting the ore for the silver which it contains....The Great Eastern ledge is over 12 feet wide, and has been stripped a distance of 65 feet, and shows Chloride in every part....25th: Langley, Cole & Co. are to have a first-class mill in Pinto District at once....We learn of a very rich strike which has been made in the mountains eastward of Steptoe Valley. The ledges are said to be of good size, and assays have been made indicating an average yield of $700....26th: A new district has been organized 100 miles south of Pahranagat, and within 15 miles of the Colorado River. The ledges are said to be numerous, well defined, and from five to eight feet in width. Assays from samples of ore have been obtained indicating an average value of $500 per ton....The Tem Piute District lies 30 miles northwest from Pahranagat. Samples of ore inspected contain extraordinary quantities of chloride and bromide.

The *News* gives an estimate, which sums up as follows: The various mines of White Pine District now yield 150 tons of ore daily, worth, in bullion, $22,500. The whole number of stamps now running is 91, and by June 1st there will be 130. The average bullion yield of this district from July to November inclusive will be about $897,000 per month.

OREGON.

Dillon & Bowden.—Jacksonville *Sentinel*, May 22d: Work is still going on in the shaft. They are now down on the lead about 90 feet, and the rock prospects well. They will commence crushing about the middle of next month.

UTAH.

Good Coal.—Virginia *Enterprise*, 29th May: We were yesterday shown a chunk of coal from the Diamond Coal Co's mine, located east of Rock Springs Station, and about 180 miles east of Elko. F. W. May assured us that there was any quantity of it being taken out. The coal is very bright and solid, and burns readily. We understand that some of it is being shipped to Omaha.

WASHINGTON.

The Moose Creek Mines.—Walla Walla *Statesman*, 14th: A company of miners, 14 in number, left Walla Walla in the early part of the week, bound for the Moose Creek mines. The reports are highly favorable, and Moose Creek promises to be one of the most important districts for mining in the northern country.

Utilizing Sensitive Flames.

The researches of Tyndall upon sensitive flames are now pretty well known to the public. The most convenient mode of producing them has been pointed out by Weinhold, and their utilization is now being carefully considered. That they *will* be made useful, is quite certain. They may undoubtedly be applied, most advantageously, to the tuning of instruments; which, when finally accomplished, will enable almost any one, by their use, to attain absolute correctness. The faintest variation in a note it is known will affect a flame, and thus make itself apparent to the eye sooner and more surely than any discord could be detected by the ear. Experiments have fully shown that flames can be devised to correspond with every note.

The possibility has also been suggested of placing behind a row of actinic flames, sensitized paper, on which the sounds of the voice might be photographed, and in this manner obtain a perfect phonographic report of a speech. Experiments already made lead to the inference that a flame may be made to correspond to every letter in the alphabet. Some of the letters, as well as the notes in music, have already their well-known representative sensative flames. There are no doubt other possible modes of utilization to which this novel property in flames may be applied.

True, none of these inventions have as yet been worked out; but their final accomplishment is even less wonderful and less improbable, in our present state of knowledge, than was such a thing as photography less than forty years ago. A new field is here presented for inventors for the achievement of both fame and fortune.

Acetate of Lead for Cleaning Photographic Plates.—Mr. Newton uses a washing solution made with two grains acetate of lead to one ounce of pure water, for cleaning plates fixed with hyposulphite of soda. It not only prevents staining, but improves the tone of the picture.

Quarterly and Semi-Annual Bullion Product.

The following figures are taken from the last quarterly returns of the Assessor of Lander County, Nevada, as given in the *Reveille*, May 13th. Though incomplete, they are the most reliable figures that we have, and are therefore of great importance:

Mine or Company.	*Tons.*	*Lbs.*	*Av. per ton.*
Blue Jacket	2	313	$120 76
Argenta	8	810	224 77
Esther	4	670	388 94

WHITE PINE.			
Bates and Jacobs	1	1700	299 18
Eberhardt	480	—	237 44
Keystone, 1st class	14	491	2454 20
2d class	123	1646	153 55
Mazeppa	11	1312	37 37
Noonday	12	900	121 84

Whole number of tons of ore returned 1,201, against 2,687 for the quarter ending December, 1868. Total value, $265,374; average value of ore per ton, $220 90. The product is more meager than during any quarter for a couple of years.

The product from White Pine, as far as obtainable, for the quarter ending December 31, 1868, was $584,288; for the quarter ending March 31, 1869—Oasis mill $100,000; Moore & Baker's mill, $21,618 74; total product for the half year, $795,986 74. In the last quarter of last year the Eberhardt produced 477 tons, which gave the splendid average of $774 per ton in currency; the Keystone, 80 tons, which averaged $554 per ton; the Hidden Treasure, 81 tons, which averaged $337 per ton; the Robert Emmet, 172 tons, which averaged $357 77 per ton; the Stonewall, 68 tons, which averaged $434 06 per ton; and the Aurora South, 378 tons, which averaged $145 09 per ton. Against these figures the Eberhardt produced during the first quarter of this year 480 tons, averaging $237 44 in gold per ton; the Keystone, first class, 14 tons, yielding the magnificent average of $2,454 20 per ton; and 123¾ tons, averaging only $153 55 per ton, showing in general a falling off. The other mines enumerated—the Hidden Treasure, Stonewall, Robert Emmet, and Aurora South—do not appear on the Assessor's books for the last quarter.

From another source of information the operations of the Oasis Mill, working Eberhardt ores, we have the following, from the White Pine *News* of April 7th, as the product during the months of October, November, and December, 1868, and January and February, 1869:

October	$60,918 94
November	103,704 54
December	66,907 45
January	43,489 76
February	107,067 65
Total	$382,038 34

That is an average of $76,420 per month, or $917,040 per year.

The same Assessor's returns assume an unaccountably different look in tabulations given by the Inland *Empire*. From these it appears that the Eberhardt reduced 480 tons of ore, which produced $187,200, or an average of $390 (instead of $237 44) per ton; the Keystone 179 tons, producing $34,368, or $192 per ton, and the Hidden Treasure 8½ tons, producing $880, or $100 per ton.

China.

The China *Mail* of March 9th, says there is a disposition among foreigners having an eye to gold mining, to go ahead, notwithstanding the interdiction of the Chinese Government, and the notices in accordance therewith of Alcock and the other foreign ministers. Machinery for "plant," in the Shautung province, is spoken of; but this does not probably amount to much. No orders for machinery have been received in San Francisco that we are aware of. It is said that the Chinese themselves acknowledge Mr. Alcock's dictum to have been a blunder. Well-informed miners and prospectors confidently entertain the idea that the consent of the local authorities is to be had, *sub rosa*, if not otherwise, since "anything can be bought in China."

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

San Francisco:
Saturday Morning, June 5, 1869.

Notices to Correspondents.

FIREMAN, Gold Hill.—The quantity of water contained in fuel greatly affects the amount of heat which it may evolve, much more in fact than is commonly understood in practice. It is well known that the evaporation of liquids, or their conversion into steam, consumes and renders latent a great amount of caloric. When green wood, or wet coals, are added to the fire, they abstract from it, by degrees, a portion of heat sufficient to convert the sap or moisture into steam, before they become a source of heat by their combustion. So long as any considerable part of such fluids remain combustion proceeds slowly, the fire is dull, affording only a feeble heat. Green wood not unfrequently contains one-third of its weight of watery matter. Nothing is further from true economy than burning green wood, or wet coal. Wood dried under cover is found to be superior as fuel to wood dried in the open air.

NUMISMATIST, San Francisco.—The penny is the twelfth part of an English shilling. Camden supposed the name was derived from the Latin word *pecunia*, money. The ancient English penny, penig, or pening, was the first silver coin struck in England, and the only one current during Saxon rule. Up to the reign of Edward I, the peuny was struck with a cross so deeply indented across the face, that it could easily be broken, and separated into two parts, and so called *half-pennies;* or into four, thence called *fourthings*, or farthings. The prince named coined the penny without indenture, and in lieu of such, first coined round halfpence and farthiugs. At the same time he ordered that the silver penny should weigh thirty-two grains of wheat taken from the middle of the ear, and twenty such pennies were to weigh one ounce.

INVENTOR.—Our impression is that the Corps Legislatif of France, some three or four years since, offered a prize of $10,000 to be awarded to any person who should, within five years, devise any means by which the voltaic pile may be economically made applicable to industry, as a source of heat, as an illuminating agent, or practically useful in mechanics, medicine or industrial chemistry. A proportionate amount is to be paid for either one of them. If the amount is not claimed within the time named, the Emperor is expected to issue the decree for a new period of five years.

FOR CHICAGO.—N. W. Spaulding & Bros. recently forwarded several thousand illustrated pamphlets from this city to their branch house, No. 41 South Channel street, Chicago. The engravings for these circulars, made in San Francisco, are superior to any we have ever noticed from the Northwestern States.

PLATINUM.—The largest nugget of platinum ever found weighs 21 pounds troy. It came from the Ural Mountains, and is in the Demidoff cabinet.

Iron Manufactures—Work at the Foundries.

Work at the foundries in San Francisco continues noisy and appareutly nearly as active as ever, yet there is noticeable an absence of that high-pressure force which pervades the sooty regions of the iron-workers beyond Market street, in a thoroughly busy season. In fact, matters there are dull; or, to speak the truth more exactly, very dull. But when the foundries are dull, it is well known that enterprise in everything new must be also at a halt. Such appears to be the fact, for the time being. The continental railroad is surely not to blame—or we might undo the iron band that binds us to the world. White Pine cannot be at fault, for though it has brought few orders for machinery, and has taken much attention and capital away from the usual regular manufacturing and engineering developments, its mining is *bona fide* and its ore deposits are real. Nor is it in the weather; for that is prime. Witness the ripe strawberries and cherries. We have not watched the financial barometer, and are not a financial meteorologist, or we might have something further to say on this subject.

It is only two or three months ago that we were in the hight of the velocipede fever. The Golden State Iron Works turned them out by scores, if not by hundreds, and they went everywhere. Now it is all of the past; everybody is tired of them, and we almost find it in our heart to say a word in favor of this flat-sided hobby-horse of the day. Mr. Knox informs us that the demand for the article has fallen off greatly. The Pavilion is found quite deserted. Yet we recall with pleasure the queer scene from the gallery, the busy crawlings of a myriad of things more indescribable and wonderful than the oddities of the bug season, around the fountain and over the bridge, that reminded one of an ant-hill. The French velocipede is discarded, but there are several American inventions that may yet prove of real practical value.

In front of the Golden State Iron Works there stands, nearly completed, a road steamer, the first that has been constructed in California, with the exception of the Standish steam plow motor. It is modeled after one of the English roadsters, and is intended for harvesting, for a gentleman in Napa Valley. It will be tried in about a week. Numerous Eastern harvesting locomotives to be drawn by horses—Hoadley's chiefly—made for Treadwell, are seen standing in front of the iron foundries, where they have been put together.

A locomotive and other paraphernalia for the City Grading Co. are in progress at the Pacific Iron Works, Goddard & Co., including half a dozen large iron rollers, etc. An important house job also in hand is the iron work for Friedlauder's new building at the northeast corner of California and Sansome streets, opposite the Bank of California.

The Vulcan Foundry is launching several new and important enterprises: A Massachusetts patent wood-preserving process, by the use of distilled coal oil, for J. C. Wood's works at the foot of King street. The apparatus consists of a collossal hollow iron ball, of about ten feet diameter, cast in two halves, for distilling the oil; and a sheet iron tank about 20x10x10, into which loaded cars are shoved, and in which the wood is impregnated by atmospheric exhaustion. This is the third tank made for this company, which has all the work it can do, such, as for example, the paving of new Montgomery street. Also a sulphur retort of about 8x4x2 in dimensions, for Gen. Hewston, to be used in a new sulphur-producing enterprise near Napa Lake. Also a large and complete piece of machinery which is to do duty as a pump in the San Francisco Sugar Refinery. Quite a number of Hepburn's pans, and also of Hess' grinders, all of large size, are completed at the works. Mr. Hepburn, we understand, claims to have reduced very materially the cost of crushing and amalgamating, by using, after reduction of the rock to a certain fineness, his device, with loose disks of iron in the amalgamating pan.

The Fulton Foundry, Hinckley & Co., are fitting out a new sugar house, the fourth started in this city, for Denoon & Co., with engines, pumps, centrifugals, charcoal kilns, etc.; also shipping and constructing more new saw mills, one of which is just ready to be shipped to White Pine, for Francis Smith. An engine of 14x24, for R. L. Ogden, is also destined for White Pine, to be worked in connection with some patent quartz crusher. Another sawmill is being built for Hayward & Harmon, lumber dealers. A few days ago a sawmill was shipped to Santa Cruz for Albert Jones, and an additional one is ordered for the same locality.

At the Ætna Foundry, Hanscom & Co., there is a new Tyler turbine for the Mariposa Estate; a number of new Carvalho super-heaters, one of extraordinarily large size; and of especial interest is the Taylor Oil Burner, which has been in operation under the boiler of the establishment for five weeks, with perfect success, as it appears. This oil burner can be used in an ordinary coal furnace, and oil, wood or coal may be used alternately without trouble. The invention is very simple, and has been tested, being about four years old. One pound of oil is used in place of three to three and a half of coal. Its cost is about $20 for 20-horse power; weight, about 150 pounds. Mr. T. W. Burns is introducing it free of cost to parties on agreement that he be allowed the amount of reduction in the reckoning of fuel.

At the Miners' Foundry, Howland, Angel & Co. have finished some fine interior State Capitol work; a new Howland rotary valve engine; a mold for the Ransome artificial grindstones, for Mr. Steen's establishment on Turk street; another of Paul's dry amalgamators; a locomotive engine for the Long Bridge and South San Francisco Railroad Co., to occupy one end of a passenger car and move along two or three extra cars at the same time; and a new barrel pulverizer of peculiar original construction—the invention of Mr. Collins, of Virginia City.

At the Santa Cruz Foundry, the *Sentinel* of May 29th reports a new 80-horse power engine, with 24-foot tubular boilers, in hand for Kenyon & Co's saw mill, to cost about $5,000, having been planned by Martin & Caudle, the master mechanics. This foundry, we are told, is fitted up very creditably, and is capable of building any machinery of ordinary size that can be needed in that prosperous manufacturing horizon, by the ocean's sands.

NEW BOATS FOR THE SACRAMENTO.—The lively competition of the Vallejo route for up river trade, is giving the public low fares and a very reasonable freight tariff. The Steam Navigation Company are making arrangements for two new boats, for day trips, with passengers and light freight. These boats are to be 260 feet long; will draw only two feet of water, and will be provided with large wheels and powerful engines, with which it is expected to make twenty-five miles an hour, thus reducing the trip to as short a time as it can be made by the Vallejo route, without the trouble and inconvenience of changing. Low fares, the overland railroad, and the increase of population in the interior, must soon create an enormous amount of travel between this city and the State Capital. The Sacramento will soon become the Hudson River of California.

CONTINENTAL Life Insurance Company, 203 Montgomery street, corner of Pine.

Pacific Medical and Surgical Journal—A Suggestion.

We should have before acknowledged the receipt of the May number of this periodical from the publishers, H. H. Bancroft & Co. It contains several interesting original articles. Among them is one from the pen of Dr. Kinkler, of Placerville, upon the curable nature of cancerons affections. Another from Dr. Folsom, of Mendocino, detailing a case which recently occurred in his practice, where, although the patient's head was literally laid open by a circular-saw cut nine inches long and three deep, he nevertheless recovered; furnishing surgical literature with "a parallel for the famous case of Gage," in New England, through whose head a drill as large as a "crow-bar" was shot, while he was engaged in blasting. The number contains also the usual amount of interesting miscellany upon medical subjects.

In this connection, we may be permitted to allude to a very sensible editorial in the New York *Medical Record* for March 1st, which we have by chance seen. The article asserts that the profession itself is responsible, in a great measure, for the growth of quackery among the people, inasmuch as it has taken no pains to spread a knowledge of true medical science. The people thirst for information upon the subject,—especially the educated classes; but none offer to give it them except the pretenders,—who are therefore listened to with avidity. Who can blame, then, those otherwise well-informed people for their utter ignorance upon medical matters, and their incapacity to distinguish between the bogus professor and the Simon Pures? If the teaching of the general principles of medical science were made to form a part of the ordinary educational routine, quackery would ultimately die out for want of support from the intelligent classes. Would it not be well, then, for the editors of medical journals to introduce a "Popular Department" as a new feature in those journals? In that way, while securing for them a greatly increased circulation, they may gradually educate the people up to a proper appreciation of the difference between an ignorant pretender and a physician who has undergone the course of training prescribed by the wisdom of those who have gone before him.

New Almaden Vichy Water.

Mr. Pioche has introduced the New Almaden carbonic acid water into the market in an article which has been named the California Vichy Water (after Vichy, France), several bottled specimens of which we have been favored with, with an opportunity to examine. Compared with some of the most renowned mineral waters of the East and of Europe, its taste and peculiar qualities merit favorable mention. Its acid taste and mineral flavor is most agreeable; its effect is invigoratiug, without the concomitant of intoxicating. An idea of its qualities is best conveyed by giving the ingredients—as per analysis of Mr. E. Piquet, of this city:

Bi-carbonate of soda	50.3 grains.
Carbonic acid	28.2 "
Sulphate of lime	10.5 "
Chloride of sodium	8.4 "
Bi-carbonate of lime	8 "
Sulphate of magnesia	3 "
Oxyd of iron	1.2 "
Silica	traces.
Total	One bottle, or two pounds=108.16 grains.

Concerning the medicinal or health-giving qualities of this water or any other of our valley carbonate and sulphate waters, we have no right to speak authoritatively; but the general impression is doubtless correct that out-door influences, in connection with the internal and external uses of waters at mineral springs, do more for the afflicted or for the recovery of those who have happened "under the weather" than medicine.

Manufacturing Notes.

Is it Buncombe?—Colfax, at the Chicago Pacific Railroad celebration, said:

"I put this prediction on record, and I won't wait ten years to see it fulfilled: That California and Oregon are going almost to rival New England in manufactures. I believe it. With all the hundreds of millions in the lands fronting the Pacific sea, stretching out their hands, as they will, toward this country for those articles that can be manufactured here, you will see the infant manufactures of the Pacific States leaping forward with the gigantic stride with which our country has illustrated its entire history in the annals of the world."

Though our destiny is plainly foreseen, and has often been asserted, how little action do we yet see in the most favored points of the interior? We hear of no great dams, of no water power being utilized for manufacturing purposes, at Bidwell's Bar, at Ousley's Bar, Folsom, Comanche Camp, Knight's Ferry, etc., where there ought to be Lowells and Lynns. Oroville has its dam—a mining concern—and will soon have its mills, we hope. Everybody knows what wonders have been worked in manufacturing within a few years, in and around San Francisco.

Complaints of decay in the mountain counties seem to us not in accordance with our true California miner's spirit of energy and hope, of taking hold *sans ceremony* where there is a good "prospect." The ox sees the locomotive approaching, but he will not move until he is positively certain that it intends to occupy the place on which he stands. We have cheap labor, and we have the market too.

Gilroy makes itself heard from again in the manufacturing way. A planing mill has just been completed, and is in successful operation, being within seven miles of the redwood forests. The Gilroyans declare that they would not swap their advantages to Oakland for all her famous water front, nor to Vallejo for her elevator; and that their park-like scenes and the hum of rural peace in which they rise to their daily labors, are such as cannot fail to enchant and captivate those who have been "used to the more rigorous climate and buckskin scenery of the northern coast counties, or those altitudes where mining yields but a meagre recompense to the hardy sons of toil."

A Suggestion from China.—The Shanghai *News Letter* of April 19th says: "We are informed that the people of California are no longer in doubt as to the practicability of raising up a silk trade of their own. We, on our side, are firm in our belief that China coals will pay to send to San Francisco, and that a railroad, even though it should not be intended to pierce India or have a terminus 300 miles off, would be of advantage could it be made to bring coals to our sea coast."

Manufacturing and Producing in Mexico.—The factories in the City of Mexico and neighborhood, at Puebla, Queretaro, Celaya and other manufacturing towns, have all suspended work for the present, says a correspondent. The fields are but little cultivated, and even the mines produce much less than in former years. In 1868 the total amount of coinage in all the mints of the Republic amounted to $199,-918 in gold and $4,163,205 in silver; instead of $17,000,000, the average coinage in all the previous years, and of $27,000,-000 in the beginning of this century.

We are furthermore informed by a mining constituent who is at work on the western slopes of the Sierra Madre, that if any fair vote could be taken to-day of the four northwestern States of Mexico, the majority would be clearly in favor of annexation to the United States.

For the Hot and Thirsty Sands.—A large brewery is in course of erection at Elko by Bixley & Bishop, to turn out five hundred gallons daily.

Brick Machines and Brick-making.—McCallister's brick machine at Albany, Oregon, is turning out 25,000 bricks per day. In San Francisco we hear of two newly invented or improved brick machines, in the hands of capitalists, concerning whose capacity and operations the public will soon probably hear more. Brick-making is not to be stopped, it seems, by such little earthquakes as we are subject to.

The Woolen Mills.—The building for the San José woolen mill will soon be completed, arrangements being now in progress for putting in the machinery. The Mission and Black Point woolen mills, we understand, will not make so great a display at the approaching Institute Fair as they did last year, but will be on hand in creditable style. In Oregon, the Salem woolen mill stopped work on May 7th, intending not to start up again until the spring clip of wool should be ready for market.

Oswego Rolled Iron.—Some of the Oswego Oregon iron rolled in this city is said to make first rate wrought iron for blacksmiths' use. Oregon iron has been pronounced rather tough for castings, but that quality is very desirable in wrought iron.

Chinese Shoe Manufactory.—Some Chinese capitalists are carrying on shoe and slipper factories in San Francisco. One at the corner of Sacramento and Battery streets employs forty Chinamen and lads, with three Wheeler & Wilson sewing machines. This factory turns out about 1,000 pairs of slippers per month. The uppers are chiefly made of carpet, or of sheepskins tanned by Chinese labor. The Chinese shoemakers in San Francisco make at least five thousand pairs of slippers per month, it is thought; and the prices ranging from $6.50 to $8.50 per dozen, the total will reach about $3,500 per month, or $40,000 per annum. In 1868, the value of imported boots and shoes amounted to nearly $8,000,000.

Iron Ore.—Mr. Chester H. Evans has brought us some specimens of sixty per cent iron ore (liminite) from Doaks' ranch, 5 or 6 miles easterly of Mokelumne Hill, where the ore can be gathered from a deposit 40 feet in width. This is the best quality of iron ore, and it will soon become valuable, if, as is hoped, some iron-worker or capitalist can be found to assist the owners in putting up a furnace. Wood is plentiful, suitable for making charcoal, and limestone is convenient. Dr. Hepburn, who has had experience in Pennsylvania, says he knows of no place in the East or West where a blast furnace could be run and pig iron produced more cheaply.

Established - - - - - 1860.

DEWEY & CO.
PATENT AGENTS,
Engravers and Publishers
Mining & Scientific Press.
Circulars Free.
SAN FRANCISCO.

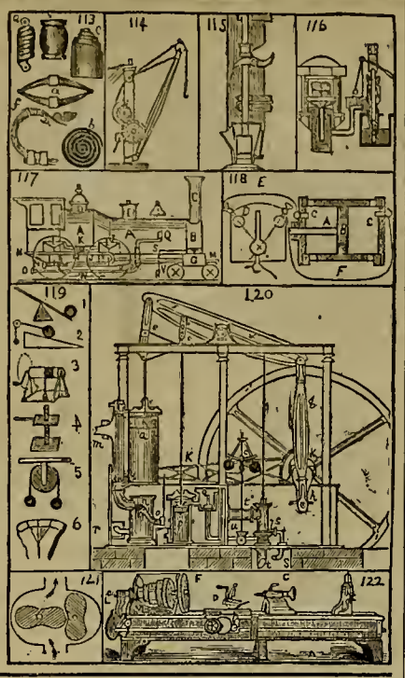
Office, No. 414 Clay Street.

The accompanying plate is from a series of Mechanical Movements illustrated and described and illustrated in our free circular, just issued, which contains a large amount of valuable information relating to Caveats, Patents, Patent Laws and Decisions, and the Rights and Privileges of Inventors, Patentees and Assignees. Copies sent to any address on receipt of postage stamp.

Promptly and Accurately

We draw up legal assignments for patentees; record assignments in the Patent Office; procure copies of United States and Foreign Patents; make examinations here and at Washington regarding the patentability of inventions; take up and prosecute rejected cases, depending upon success for our fees; reissues taken out; interferences prosecuted—in fact, every legitimate branch of the patent agency business is thoroughly conducted by us here and our branch agency in Washington.

DEWEY & CO.,
No. 414 Clay street, San Francisco.



Book on Mineral Deposits.

We learn that Cotta's *Erzlagerstaettenlehre*, a large and very valuable work, in two volumes, describing and classifying all of the known, especially the worked ore formations of Europe, has been translated into English by a young mining engineer, lately one of Cotta's pupils, and will probably soon appear in New York. So far as the American field is concerned, additions, we anticipate, will be made, which must enhance the value of the original work many fold—so much having been done, and so little written, regarding those new developments that have enlarged the American knowledge of vein geology since the discovery of Washoe silver. Cotta's work is especially good in the feature of classification of different kinds of deposits, and in its tabulations according to the minerals constituting ordinary pay ores. Its illustrations of the many varietics of worked deposits will throw much light upon a branch of mining science in which our miners' opportunities for comparisous have been limited to personal observation and travel. There are other works treating far more exhaustively of the nature of ore deposits than this of Cotta—who is, however, a model compiler, a popularizer—and little more.

In a new work on mineral deposits which is expected to meet the wants of the day, we call attention to the requisite that the Australian mining fields should not be overlooked; and that due importance should be attached to describing the results of chemical and mechanical modifications in surface concentration, a matter which possesses a great and direct interest to the practical miner who delves for profit.

Miss Anna E. Dickinson.—We have recently received a letter from a member of the family of this remarkable oratress, which gives a strong intimation that she will visit this coast the present season, seeking a field of rest and pleasure rather than professional engagements. Miss Dickinson has expressed a strong desire to visit California for the past few years, and we are quite confident that she will be one of the first of many talented lecturers from the Eastern States who will soon visit this coast, by rail, and afford Californians a new role of intellectual entertainments. We take it for granted that one so well calculated to appreciate the grand scenery and peculiar characteristics of this country, who has a gift for speaking eloquently, cannot refrain from doing so, whether intentional or not.

Farming, says an Eastern writer, will never be what it ought to be until we are able and willing to furnish men work during the winter, as well as in summer.

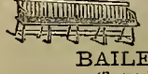
Latest From Grass Valley.

The Grass Valley Strike still "drags its slow length along." At last accounts, however, it was very quiet and doing no harm. There were some slight indications of forcible resistance made on Monday, when about forty newly employed men arrived at the Empire mine. At the hour for going below, a large number of "strikers" present used such threatening language that all but about a dozen of the forty backed out for the day. The next morning, the strikers, having got wind that the Sheriff would be on the ground with an armed force, wisely kept away, and all has since been quiet.

There has been a formal "change of front" by the League during the week. It has rescinded the obnoxious "force" resolution, denounced the party which interfered at the Empire mine on Monday, and will hereafter advocate the employment of moral suasion only, to bring about the disuse of giant powder. The citizens of Grass Valley have met in public meeting, and resolved to sustain the mine owners in their legal rights, and the laws of the State. All this shows a return to sense and reason, and an early establishment of quiet and work at this important mining locality.

Another Mastodon.—Mr. R. H. Dunning,—the inventor of several very useful gold-saving and ore-concentration devices, through the introduction of which he has become well known in nearly all of the foot-hill counties—exhibits to us from Stanislaus County a colossal thigh bone of a mastodon, which is remarkable especially amongst specimens of the kind in California for being in part very well preserved. It was found by Mr. Dunning five miles distant from Knight's Ferry, where the remaining bones are partially imbedded in a post-tertiary sandstone, and partially in the superficial gravelly detritus covering the sandstone. It weighs forty-nine pounds; the part fitting into the thigh socket is twenty-three inches in circumference; the piece of the thigh brought away measuring in length not quite three feet. Mr. Voy, it will be recollected, (Mining and Scientific Press of May 1st) mentions several localities in the same county—opposite Knight's Ferry and along the Stanislaus River,—where not only mastodon bones, but human relics of the stone age have been found. Mr. Dunning took his specimen with him by the last steamer for New York.

The Biggest Nugget Yet.—It is reported that a gold nugget weighing 210 pounds troy has just been found in Dunolly, Australia. The two men who found it, a year or two ago found two nuggets weighing respectively 108 and 36 ozs.; but had again got "broke," and could get no credit at "the store." On melting, the nugget yielded about thirty-five thousand dollars.



BAILEY & SMITH,
(Formerly Derby & Bailey.)
Manufacturers of SCHOOL FURNITURE, Settees, Office Desks, Etc.,
No 51 Beale street, near Mission, San Francisco.
☞ Having recently fitted up with the best of Machinery, we are prepared to furnish all kinds of work in our line at the lowest rates.
BYRON BAILEY. 23v18-3m WM SMITH.

PROPOSALS WANTED!

ARTESIAN WELL.

THE OREGON
STATE AGRICULTURAL SOCIETY

will receive proposals until the first day of July, 1869, for boring an ARTESIAN WELL on the Fair Grounds belonging to the Society, 1½ miles from Salem. All communications and proposals to be addressed to
J. H. MOORES,
23v18-2w Salem, Oregon.

Notice To Mining Companies.

The undersigned offers his services to the mining public. Having devoted several years to the study of mining and metallurgy in some of the best schools and works of Europe, and being acquainted with the metallurgical treatment of ores as practiced on this coast, he is confident of his ability to render valuable aid to parties employing him.
CHAS. C. RUEGER.
Address, care of Mining and Scientific Press. 23v15

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hanshrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, fuel saving, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

Written for the Mining and Scientific Press.

In Favor of Carbonic Acid.

It has seemed to me that the doctors and professors have made this a kind of hobby in a bad sense; that is, they have for a long time been trying to ride it to death.

They tell us much about the invigorating effects of pure air, and of the deleterious effects of impure air. By this last phrase they always mean air containing more or less of carbonic acid. The day has gone by in which any man is to foist theories and hypotheses upon the public, unless sustained by observed facts; or to compel us to hold on to old theories after facts have shown their falsity.

Let us look at some of the facts. Pure carbonic acid is composed of oxygen and carbon, and is usually obtained in the form of gas. Sometimes it is seen solid as snow. It is then very cold and readily melts and changes its form, though it does not make water like snow, but passes at once into the gaseous state.

When taken into the stomach with our food or drink it produces no injurious effect; but it can not be taken pure into the lungs without very serious evil. On this account the doctors advise us to avoid it altogether. Here lies their mistake. Indiscriminate condemnation and deprivation of one of God's good creatures.

Carbonic acid has its uses. It enters largely into the growth of all plants, as they constantly absorb the gas during the day time, and give off a portion of it again during the darkness of night. Its use in small quantities for respiration must be beneficial.

The lion, king of beasts, sleeps in his lair which is not very well ventilated. The royal tiger takes his siesta in the impenetrable jungle where ventilation never comes except as a tornado, and then the tiger hastens to find a more healthy lodging in some other jungle. The eagle, king of birds, after snuffing the pure air as long as he can endure it, or till he gets his dinner, must retire to some safe place, and hiding his beak among his feathers, breathes a little carbonic acid just to refresh himself. The badger lives most of his time under ground in an ill-ventilated apartment, yet it takes two good dogs to kill him, though they spend most of their time in the open air, and only take a little carbonic acid in their kennels.

Carbonic acid must be good for animals while sleeping, else why is it ordained that trees and plants give off this gas at night while honest men are asleep. No doubt the air in churches, theaters and public halls, is often very impure and unwholesome. But bad lungs, decayed teeth, overloaded stomachs, unwashed feet, whisky and tobacco, have more to do with it than carbonic acid. Let public rooms be well ventilated immediately after the audience leaves, on account of these festering impurities more than from fear of carbonic acid. JEIGH ARRH.

[Writing from a cliff far out in the inorganic atmosphere of the Pacific, and breathing nothing but spray, we do not wonder at "Jeigh Arrh's" swinging around, finally, in favor of a little carbonic acid,—for is it not that gaseous substance that builds the organic world?—[EDITOR.

GOODS SHIPMENTS FROM NEW YORK TO SAN FRANCISCO.—We clip and condense the following from the New York *Commercial Advertiser*: "Few people are aware of the large quantities of goods that are required by the inhabitants of the Pacific slope. From this port alone there are no less that four regular lines, via Cape Horn, seuding on an average six vessels per month, or nearly 15,000 tons of cargo. Steamers via Aspinwall and Panama take at least 3,500 tons of goods per month. From Boston there are two lines, which dispatch about 4,000 tons of freight per month."

GLASS PLOWS.—It is stated that the proprietors of a plate-glass establishmeut in Massachusetts are employing glass in the form of mold boards for plows, for western lands, where the soil is very destructive to iron.

KILLED BY THE STING OF A BEE.—A man in England, recently lost his life by the sting of a bee on the jugular vein. Faintness came over him, and he died within half an hour.

LENGTH OF GUN BARRELS.—A correspondent of the *Scientific American*, who is a gunner and a gunsmith, gives the following hints: "For rabbits or partridges, a double-barreled gun need not be more than 24-in. barrels and 14 gage. For ducking on the Chesapeake, where they shoot from stands, the best is a 4-foot barrel (single), and five gage. For ducking on the eastern bays, the best is a double gun, with 32-in. or 34-in. barrels and 9 gage. The best for all kinds of shooting is a 14 gage, 30 in. barrels of from 10 to 14 lbs. weight. I do not agree with you that 16 or 18 inches will produce as good an effect as the longer ones. First, there is more recoil. Second, the muzzle will throw up at the discharge, spoiling the shot. Third, the charge gets out of the barrel too quick, or, in other words, before the powder is all ignited. Take two guns equal otherwise, one 16-in. and one 30-in. The 16-in. will throw out part of the powder unconsumed (which may be seen if fired across snow); the other will not. If the gun tapers from muzzle to breech, it will scatter, or if *vice versa*, will give and cut the shot, and will, in course of time, spring the barrels.

ILLINOIS
SILVER MINING COMPANY
White Pine District.

Trustees:
JAS. H. CUTTER, B. E. FREEMAN,
E. H. SHAW, JAS. R. GARNISS,
DAVID BUSH.

The Company's Mine adjoins the celebrated "Silver Glance," and is in close proximity to the "Argyle," and other prominent mines of the District.

From developments already made, the Trustees feel justified in saying to their friends that this is one of the best opportunities ever offered for investment in this State.

For the purpose of further developing the mine, the Company has set aside a limited amount of stock, to be sold as a working capital, of which they now offer 1000 shares, at the nominal price of $2 50 per share, unassessable—the entire proceeds of which will be devoted to developing the mine.

The books of the Company are now open for subscription at the office of the Company, No. 432 Montgomery street, Room No. 1, first floor. By order.

JAS. H. CUTTER, President.
G. W. STEWART, Secretary.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skilful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

New Patents Issued to Pacific Coast Inventors.

From official reports to DEWEY & CO., United States and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.

Copies of any U. S. Patent Claims furnished immediately for 75 cents. Full copies of American or Foreign Patent Claims can be obtained by telegraph or mail through this office.

FOR THE WEEK ENDING MAY 25th.

SAW AND SAW TOOTH.—John M. Johnston, Mayfield, Cal.—90,365.

I claim, in combination with the wedge-shaped recess D, cut in the base of the tooth, the wedge E, consisting of two pieces, riveted together, and provided with beveled edges, substantially aa and for the purpose set forth.

That portion of the removable tooth which fits into the recess, is made of a uniform width and has a suitable opening in its lower end for the reception of a wedge of peculiar construction, while the recess into which it fits is widest at the bottom. When the tooth is driven down, a small wedge inserted in the lower end of the tooth gradually expands the lower portion until it fits in the socket firmly. The inventor claims that by this mode of constructing and inserting saw teeth, a great advantage is had both in the effective operation and strength of the saw. The dangers of splitting, or cracking, is no greater than in any of the saws now in use, and the cost of manufacture will be no greater.

PAINT FOR SHIPS' BOTTOMS. — Henry Roundy, San Francisco, Cal., assiguor to Thomas M. Cash, same place.—90,395.

I claim the above-described composition for paint, made of the ingredients named, mixed, or compounded as enumerated, in about the proportion specified.

The product of this important invention is the California Marine Metallic Paint, already introduced to the favor of our commercial community by a company of well-known business men of this city. The tests already made of its virtues has justified the proprietors in applying for patents for several foreign countries where it is expected to come into extensive use. This paint can be furnished at favorable prices, while it is claimed to he a greatly superior article for preserving wooden ships, and effectually preventing iron vessels from rusting and corroding. It is also guaranteed to protect vessels, wharves and piles from attacks of the *toredo navalis*, and all kiuds of wood work from the ravages of the white cut and comajen, and other insects noted for destroying wood.

AMALGAMATOR.—James Thomson, Gibsonville, Cal.—90,409.

I claim, 1. The inside cylinder D, with its perforated cover E, confining-ring P, and clamp O, in combination with the feed-pipe B, constructed and operating substantially as described.

2. The wooden bottom J, provided with a concave surface I, in combination with the perforated watcr-pipe C, substantially as and for the purpose herein set forth.

3. The heater K, adapted for steam or fuel, in combination with the amalgamator, substantially as herein described.

This device consists in first passing the pulp from a quartz mill battery through a long vertical tube, which extends down into a shallow cylinder with a perforated cover. This cylinder is filled with mercury so that it stands at some depth on the cover, and all the pulp is forced by the pressure in the tube to pass through the mercury, and is intimately mingled and brought in contact with it by means of the perforated cover. After leaving this smaller cylinder, the pulp spreads over an amalgamated copper plate, around it aud within an outer large cylinder, and rises till it is discharged through an adjustable gate. A bent perforated pipe discharges cold water into the pulp, and by its action tends to unite the particles of mercury, and also to carry the pulp to the center. The whole mass within the cylinder is heated by means of steam within a chamber placed beneath. This chamber is so constructed that fuel may be used to heat it in place of steam, if desired.

BELT BUCKLE.—Francis Clauseu, San Francisco, Cal.—90,501.

I claim the projecting lip *a*, fixed relatively to the plate of the buckle, and provided with short or friction teeth, in combination with the smooth, vibrating, slotted bar *b*, arranged to press the ribbou against said teeth, substantially as deacribed.

This is au improvement on a lady's belt buckle, previously patented by the iuventor, and consists in arranging on the beveled projecting lip, over which the slotted bar folds, short teeth, to aid in holding the ribbon or belt firmly in place. We should judge this device would become popular with Califoruia ladies that are partial towards elegant gold buckles.

STAKE-PULLER.—Richard Knott, Suisnn City, Cal.—90,559.

I claim, in combination with the lever A, and its fulcrum, the ring B, pivoted at one side to the end of said lever, substantially in the manner and for the purpose set forth.

This device is designed more especially for drawing the iron pins which are used for securing horse-powers to the ground. It consists of a lever having at one end a ring with a hole sufficiently large to pass down over the stake. One side of this ring is formed into a clip, pivoted to the end of tho lever. A bar of metal is hinged below the lever near the same end which answers for a fulcrum. To operate the device, the ring is slipped over the stake to be drawn, while the handle of the lever is elevated, and the fulcrum placed on some solid body. By bringing down the lever the ring is turned sidewise, causing it to bind against the sides of the stake and draw it upwards. Raising the handle of the lever again allows the ring to slip further downward ready for another pull.

MACHINE FOR REAPING AND THRESHING GRAIN.—L. B. Lathrop, San José, Cal. —90,561.

I claim, 1. The device herein shown and described, for raising and lowering the sickle-bnr, or rather tbe whole front of tbe apparatus, said device consisting of the upright screw *b*, nut *c*, on arm *d*, the latter being hinged to the tongue C, while tbe screw *b* is swivelled in the frame work of the machine, the tongue C bcing hinged at its rear end by a horizoutal bolt, *j2*, substantially as and for the purpose herein shown and described.

2. The spring *l*, attached by means of a link to tbe off end of the sickle-bar, substantially aa and for the purpose herein sbown and described.

3. The application of the fan *d1* in the cylinder I', immediately below the inner end of thc apron Z, and under and in front of tbe threshing cylinder, substantially as and for the purpose herein shown and described.

4. In combination with the roller S and tbreshing-cylinder D', tbe separator J', when operated in an inclined box M', by two or more eccentric shafts K, substantially as herein shown and described.

5. The machine herein shown and described of moving the endless apron C', by means of two flexible or rubber rollers, Q' and *l'*, which bite the under side of the apron, substantially as herein shown and described.

6. Lining the edges of the endless aprou C' with cords or strings *m1*, substantially as and for the purpose herein shown and described.

7. Tbe manner herein shown and described, of regulatiug the fan *n'* in the cylinder R', by means of the sliding inclined plato P', substantially as set forth.

8. The application of a blast of air, whicb is created by means of a fan, *g2*, iu a drum, S', and tube I', for the purpose of elevating grain to the hopper U', substantially as herein shown and described.

9. The bag-holder, when consisting of the U-sbaped bar *s'*, which is hinged to the sidc of the frame of tbe machine, and whicb is combined with the bar v, and plates *w'* and *a2*, tbe latter being operated by a lever, *c1*, and all being made and operated substantially as herein shown and described.

10. Tbe combination, with the above, of an up-and-down adjustable board W', substantially as set forth.

11. The combined comb and rake, consisting of tbe bar X, hinged rod *m*, tines Y, and revolving tootbed reel B', all made and operating substantially as and for the purpos© herein shown and described.

PROCESS OF SEPARATING IRON AND OTHER METALS FROM POTTERS' CLAY.—William John Lynd, Golden City, Colorado Territory.—90,565.

I claim. 1. The process of removing iron, copper, and other discoloring matter from potter's clay and other argillaceous substances, by subjecting the clay, when in solution, to the action of onc or more magnets, in the maunor and for the purposes set forth.

2. The method of precipitating the iron and other discoloring matter in the clay solution, by passing through the bath contaiuing such solution a current of electricity, as and for the purposes set forth.

3. The mode of preparing potter's elay aud like substances from which discoloring matter is to bc removed, by subjecting such substance, in solution, first, to the action of a current of electricity, and afterward to magnetic action, in the manner and for the purposes specified.

LAMP EXTINGUISHER.—Carlton Newman, San Francisco, Cal.—90,572.

I claim, 1. The short sliding tube E and the link F, in combination with the lid *a*, whether attached directly to the lid or uot, the whole constructed and operating substantially as hercin described.

2. The curved rod *c e e'* and the weight H, when in combination with the link F and tube E, substantially as hercin described.

3. In combination with tbe tube E, link F, and lid *a*, the curved rod *c*, and weight H, substantially as described.

This invention consists of a tube for fitting the lamp, having a lid which shuts over it. In order to prevent accidents either from filliug the lamp or by upsetting it, a short sliding tube moves up and down outside of the wick tube, and is connected with the lid of the fitting tube by a liuk so that if the lid be raised either to fill the lamp, or by upsetting it, the flame will be extinguished by the sliding tube. A bent arm passes through the side of the top or burner, and has a weight attached to the end outside, and this arm is also connected with the extinguishing tube, so as to insure its moving if the lamp upsets. The weight aud the sliding tube may move independently of the lid, but the lid cannot be opened without extinguishing the lamp.

THE Commissioner of Internal Revenue has decided that farmers who have their grain manufactnred into flour, and then sell the flour in any manner, must pay a license to the Government.

ARTESIAN WELL.—The Oregon State Agricultural Society designs having an artesian well bored on their Fair grounds, near Salem. Secretary J. H. Moores advertises for bids in another column.

New Mining Advertisements.

Dos Pacre Gold and Silver Mining Company, Alamos, Mexico.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-ninth day of April, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.

Lohse, J F	242	10	10 10
Simon, S	88	10	10 00
Meara, Theo	99	10	10 00

And in accordance with law, and an order of the Board of Trustees, made on the fifteenth day of April, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by J Middleton & Son, at their salesroom, 310 Montgomery street, San Francisco, on Monday, the fourteenth day of June, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOHN F. LOHSE, Secretary.

Office, 318 California street, San Francisco. my29

Pain Killer.—We beg leave to call the attention of the public to this long celebrated and unrivalled Family Medicine. The Pain Killer is a purely vegetable compound, and while it is a most efficient remedy for pain, it is a perfectly safe medicine even in the most unskillful hands. For Summer Complaint, or any other form of bowel disease in children or adults, it is an almost certain cure and has without doubt been more successful in ending the various kinds of Cholera than any other known remedy, or even the most skillful physician. In India, Africa and China, where this dreadful disease is even more or less prevalent, the Pain Killer is considered by the natives, as well as European residents in those climates, a sure remedy.

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

KENDRICK & CO., and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents. jelm

Company Transactions.

New Incorporations.

The following new companies have been incorporated:

MINING.

LONE PINE SMELTING CO.—May 28th. Object: To smelt silver galena and other ores, and to buy and sell the same in Inyo county, this State. Capital stock, $20,000, divided into 200 shares of $100 each. Trustees: John Lutgens, Thomas Breen, Wm. Smedburg, O. D. Squires and Philip Mahler.

SUSCOL M. & M. CO.—Capital, $1,140,000, to operate in Gold Hill, Nevada.

GREAT CENTRAL G. & S. M. Co.—May 30. Gold, silver and copper in Battle Mountain District, Humboldt county, Nevada. Capital stock, $1,200,000, in 12,000 shares of $100 each. Trustees: Washington Ayer, F. P. Swott, J. H. Culver, T. W. Mulford and E. H. Snaw.

COMANCHE & WAR EAGLE M. CO.—White Pine. June 1st. Capital stock, $1,500,000; 15,000 shares of $100 each. Trustees: W. F. Foster, Peter Whelan and Charles E. Johnson.

PIUTE M. CO.—White Pine. June 1st. Capital stock, $5,000,000; 50,000 shares of $100 each. Trustees: Elliott J. Moore, P. B. Forster, H. G. Langley, R. C. Johnson, R. Mayrisch, D. H. Jackson and C. P. Schmidt.

BASE METAL SMELTING WORKS CO.—White Pine. Capital stock, $50,000, in 10,000 shares of $5 each. Trustees: John N. Risdon, James Chaplin, Lewis R. Word, C. A. Sankey and J. Arthur Hope.

SHOENBAR LODE M. CO.—White Pine. Capital stock, $5,000,000. Trustees: E. J. Moore, H. G. Laugley and P. B. Forster.

HOMESTEADS.

WEBSTER STREET H. A.—May 25th. Block 314, in the Western Addition; 44 shares of $1,400 each. Trustees: H. Kenitzer, Joseph Fredericks, John Apel, L. M. Cahn, Louis Kaplan, A. E. Hecht and P. Beroin.

NEW EXCELSIOR H. A.—May 29th. Lands in Visitacion Valley. Capital stock, $181,000, in 604 shares of $300 each. Trustees: R. Bayerque, C. F. Wagner, R. J. Harris, T. Meetz, J. H. Applegate, Jacob Regensberger and J. Napthaly.

Meetings, Elections, Etc.

MINING.

DIAMOND M. Co.—May 26th. Trustees: John Bauber (President,) William Codington, F. H. Wells, James Dunn and James Bailey.

HOPE GRAVEL M. Co.—May 27th. Trustees: Lewis Teese, Jr., (President),) William Sharp, (Vice President), H. O. Howard, W. A. Bateman, Wm. Carman. David Wilder was chosen Secretary, and Samuel Locke Superintendent. The company expect to be ready to take out ore in a month.

ENTERPRISE G. AND S. M. Co.—June 1st. Trustees: E. B. Mott, Jr., (President,) W. B. May, Secretary,) W. T. Fonda, Thomas R. Church and William C. Furrey.

BROMIDE FLAT M. Co.—June 2d. Trustees: David D. Colton (President,) W. E. Barron, A. Hayward, George Hearst and Charles Barner. Charles E. Johnson was appointed Secretary.

HOMESTEADS, ETC.

VILLA H. A.—May 27. Trustees: Richard Dorn, H. Hochkoffer, L. Gottig, A. Schatz and O. Schoeman.

GARDEN TRACT H.—May 31. Trustees: W. C. Doolittle, (President,) S. Littlefield, (Vice President,) James Gravea, J. T. Carr, D. K. Swim and George R. Starr. F. B. Wylde was appointed Secretary, and C. D. Wheat, Treasurer.

ABBEY H. A.—June 1st. Trustees: William J. Stringer, (President,) Edward C. Lovell, (Secretary,) James L. Blakie, (Treasurer,) John S. Luty, R. F. Fordham, E. Highton and Willard Hodges.

PIONEER H. A.—Alameda, May 24th. Trustees: Edward Babson, John Harding, James Alger, John A. Plummer, Jr., and William P. Harrison. James E. Damon was elected Secretary. Edward Babson, President, James Alger, Vice President, and William P. Harrison, Treasurer.

SHIPJOINERS' ASSOCIATION.—President, P. R. Black; Vice President, C. R. Pike; Secretary, George Blain; Treasurer, Geo. Cavan. Trustees: Thomas Nash, L. H. Langton, C. L. Prince; Sergeant-at-Arms, J. D. Galloway.

ORIENTAL FIRE AND MARINE INSURANCE Co.—May 27th. President, John Bell; Vice President, J. N. Eckel; Temporary Secretary, H. H. Bancroft; Counsel, W. H. Sharp.

Resources & Developments

SONOMA COUNTY.—A small steamer has just been launched, built expressly to run on the Russian River. She was to have made her trial trip yesterday.

Mr. A. D. Moore & Bro. of this city, has purchased the Carlton mill, near Bodega, and about 8,000 acres of good timber land in the immediate vicinity. They will build a railroad from their mill to the nearest shipping point, a distance of some twelve miles.

JACKSON COUNTY, OREGON.—It is claimed that the Klamath lake basin will in a few years contain a larger population than Rogue River Valley. It is settling up rapidly. An exploring party has recently made the trip from Cañonville through the mountains to Fort Klamath. They got through without difficulty, and report that $1,000 will make a good trail over the route.

STOCK GOING EAST.—W. C. Myers, an old resident of Jackson County, has started across the plains with a drove of horses. He expects to find a ready market for them in Missouri. This is turning the tide of trade. Messrs. Tice and Crano, also of Jacksonville, have started for Nevada, (Washoe), with a drove of hogs.

THE UMPQUA RIVER.—The country about the mouth of the Umpqua River, including Smith River Valley, is said to be improving more rapidly than it has been for several years past. The increased capacity of the Gardner mill has improved the demand for logs, and every location that offers even small encouragement for the logger or farmer, will be occupied during the coming summer. The Umpqua empties into the Pacific Ocean, about midway of the Oregon coast line.

"OVER THE LEFT."—The Sacramento *Union* says "the San Francisco Land-Grabber's Association are doing much toward the rapid settlement of this State by monopolizing all the good lands in sight, and raising their price from one dollar and a quarter in currency to $10 in gold." Nearly all the available lands of California are in this fix.

FLAX IN OREGON.—It is said that from three to four thousand acres of flax have been sowed in the Willamette Valley the present season. From 10 to 12 bushels the acre is expected, and the pioneer oil mill, at Salem is offering from $1.50 to $1.60 per bushel for the seed delivered at the mill. So says the Willamette *Farmer*.

SAN DIEGO, it is claimed, must soon become an important city. Both Los Angeles and San Diego counties are rapidly filling up with emigrants.

A POST ROUTE has been established from Maggie Creek (Carlin), Nevada, via Silver City, to Boise City, Idaho.

LOUIS NAPOLEON AND THE ENGLISH ENGINEERS.—While Louis Napoleon was still Prince, some 22 years ago, he addressed the members of the English Institution of Civil Engineers upon the subject of a canal connecting the Atlantic and Pacific. He showed genius in that line. Two months ago, that body elected him an honorary member; and on the 1st of May a Commission composed of the chief officers of the Institution waited upon him at the Tuileries and presented the usual Diploma.

The Emperor signed the register, and expressed his high gratification at the compliment. The Commission received invitations to a reception at the palace, and afterwards to dine with his Majesty.

FARM PROFITS IN OHIO.—The net profit per acre on the crop of corn to which the Ohio State Board of Agriculture awarded its last year's premium was twenty-eight dollars and seventy-six cents.

LEATHERED TACKS.—The Patent Commissioner has granted an extension to M. M. & J. C. Rhodes for their patent for a machine for leathering the heads of tacks. Over six millions of this style of tacks are used in the United States, daily.

SAN FRANCISCO, May 5, 1869.—MESSRS. DEWEY & CO. Gentlemen:—Allow me to express to you many thanks for services rendered me in procuring my patent, which has just come to hand. I would also say that your work has been faithfully done, and your advice and representations have in all cases been honest and truthful.

Respectfully, GEO. INWOOD.

POISON SUPPLANTED.—The deadly "firewater" which for many years was so fatal to the gold-seekers of California, is, to use the vernacular of the mines, "about played out." The diggers and quartz crushers decline, as a rule, to buy or use it. They find, however, that a tonic is necessary to enable them to withstand the unhealthy atmosphere of the placers, and to bear up against the privations and hardships to which they are subjected. After having tried a variety of medicated stimulants with a view of holding fast to the best, they seem, as a class, to have settled down in the opinion that Drake's Plantation Bitters have no equal as a strength-sustaining preparation and as an antidote to the malaria that produces intermittent and remittent fever. ***

A SPECTACLE WORTH SEEING—The continental crowd at Muller's Spectacle Emporium, 205 Montgomery street. *

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869.—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT, Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBEBG & MOORE.

Messrs A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you and find them superior to any we have yet tried, although we have used every one obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S. Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,

Pacific Mail Steamship Co's
STEAMSHIPS FOR
NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at **11** o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the **10th, 17th** and **30th** of each month that has **30** days
On the **10th, 18th** and **30th** of each month that has **31** days.

When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding; when the 17th falls on Sunday, they will leave on the Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departure of the 17th or 18th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

The following Steamships will be dispatched on dates as given below:

June 1—GOLDEN CITY.....Capt. Wm. F. Lapidge,
Connecting with ARIZONA, Capt. Maury.
June 9—MONTANA.....Capt. E. S. Farnsworth,
Connecting with ALASKA, Capt. Gray
June 13—COLORADO.....Capt. Wm. H. Parker,
Connecting with HENRY CHAUNCEY, Capt. Connor.
June 30—CONSTITUTION.....Capt. Wm. H. Hudson,
Connecting with ARIZONA, Capt. Maury.

Passengers berthed through. Baggage checked through. One hundred pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets to Liverpool by the "Inman" and "National" Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight to New York and Way Ports, Company's Form of Bill Lading only used.

No Freight will be received on board after 2 P. M. of the day prior to the steamer's departure.

The Steamship CHINA, Capt. Wm. Law, will be dispatched for YOKOHAMA and HONGKONG on FRIDAY, June 4th, 1869, at noon connecting at YOKOHAMA with the steamer NEW YORK for SHANGHAI.

For passage, freight and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets

OLIVER ELDRIDGE, Agent.

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.

Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

J. M. BUFFINGTON,
Room 37 New Merchants' Exchange, California street, San Francisco 17v15-tf

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding months of delay requisite in transacting business through Eastern agencies.

A NEW
Gold Metal.

THE GOLD METAL WATCHES

Now being introduced by

C. E. COLLINS & CO.,

No. 629 Washington street,

SAN FRANCISCO,

Surpass anything yet made in the way of an Imitation Gold Watch. They wear well, and keep good time.

The Ladies' Watches cost $8 and $10 each. The Gentlemen's cost $15 and $20 each. Chains, from $3 to $6 each.

RECOMMENDATIONS:

SAN FRANCISCO, May 12, 1869.

This to certify, that I have carried one of the small size Gold Metal Watches which I got of C. E. Collins & Co., and I find that it runs as well, and keeps as good time, as any Watch I ever carried, and I can therefore recommend them. I am engaged on the Sacramento steamer "Chrysopolis." C. A. COLAY.

I am an engineer on the San Jose Railroad. I have been carrying one of C. E. Collins & Co's Watches for about one year, and I can safely say it is the *very best* watch for time that I have ever seen. GEO. CORNWALL,
Engineer on the San Jose Railroad.

MESSRS. C. E. COLLINS & CO:—Having heard your watches spoken of in the highest manner, I have resolved to order one for myself. You may send me one of the Lady's $10 Watches, without the chain. Send it as soon as possible, as I am very much in need of a time-piece.

R. B. PATTEN,
Toano, C. P. R. R.

The Public are cautioned against buying their watches at high prices, as many of them are sold for genuine *Gold Watches*, at from $100 to $150 each.

For List of Prices and Description of Goods send directly to us. Can be sent by Express, to be paid for on delivery.

C. E COLLINS & CO.,
No 629 Washington street, San Francisco.

P. S.—Where six Watches of the above are ordered at one time, we will send one extra, free of all charge.

We also deal in the finest Gold and Silver Watches Watch Materials, etc. Send for circulars or prices.

RANSOME'S PATENT
Diamond Grit Grindstones,
Warranted of Uniform Texture,
TWICE AS STRONG AND WILL CUT AT LEAST TEN TIMES AS FAST AS THE BEST NATURAL STONES.

We manufacture the following qualities, viz:
"Hard," for Machinists, etc.
"Medium," for General Use.
"Soft," for Wood Workers, Etc.,
Diameters, 4 to 70 inches; thickness, ¼ inch to 12 inches; and any fineness required.

Solid Emery Wheels and Sharpening Stones,
Of all forms and materials.

These Stones are fast superseding the natural ones in England, the tests made there showing them to cut about fifty (50) times as fast as the Newcastle, and entirely free from flaws, and hard and soft spots.

☞Grindstones, with Frames, Iron Troughs, Shafts and Treadles, ready to set up in working order, for sale a wholesale or retail.

PACIFIC STONE COMPANY,
E. T. STEEN, Sup't.,
20v18tf Cor. Turk and Larkin sts., San Francisco.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is throwu to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so coustantly and perfectly in contact with quicksilver, that the particles are rapidly and com pletely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

ELLERY'S PATENT
India Rubber Cement and Paint

CALIFORNIA AVENUE
Homestead Association.

Lots from 26 to 30 Feet Frontage by 129 Feet in Depth, in Blocks 88, 89, 90 and 91. Fronting on California street, between Seventeenth and Twenty-first Avenue.

Shares, $330 Gold Coin,
Payable in Monthly Installments of $10, without Interest---First Payment, $20.

This Association is organized to purchase a tract of land comprised in the above-mentioned blocks. The location of this property being on THE LINE OF ONE OF THE MAIN AVENUES leading westerly from the business center of the city, and now easily accessible, makes it unsurpassed in present and prospective value by any property in the suburbs of the city. California avenue will at an early day be graded its entire length, and the railroad facilities which will be furnished during the next year will amply accommodate all shareholders who may desire to improve their lots.

There is NO DRIFT SAND on or near this property, and NO HIGH HILLS. The lots are large, and ALL DESIRABLE. TITLE PERFECT.

Its fine location, nearness to the business portions of the city, and the low price at which it is offered, combine to recommend this property to all who desire a profitable investment on easy terms.

Books of subscription open at the office of H. R. CONGDON, No. 619 Montgomery street. 21v18 2t

Railroad Items.

SIGNIFICANT.—So important has the railroad interest already become, in this State, that a Railroad Directory has been projected, to the end that the people may have something for general reference in all business relating to railroad traffic. The work will be published by Mr. J. W. Standwell, of Sacramento, and will be known as "Standwell's Railroad Guide." It will appear in a few days.

THE CALIFORNIA PACIFIC. — Business upon this road is increasing so rapidly that arrangements have been made to put on a large propeller between Vallejo and San Francisco, for the purpose of carrying freight, the New World proving inadequate to the trade. It is also the intention of the company to put on an additional passenger steamer to run in connection with the New World.

THE CENTRAL PACIFIC has reduced its fare to five cents per mile, between Sacramento and Marysville, with a proportionate reduction on freight. Low fares and cheap freights, only, can be depended on to fill up the country and support our rapidly growing railroad interest. A large through business has already been established on this road, which must increase from month to month in the future. The low rates of fare and freight established cannot fail to lead to such a result. The delays at the junction, heretofore reported, have been overcome, and no time is now lost in waiting for trains. The various railway companies from Omaha, east and south, are so arranging their own time and tariff as to encourage travel over the Union and Central roads.

THE WESTERN PACIFIC will soon bring the overland cars practically into this city direct—probably by August or September. The completion of the tunnel at Livermore Pass will be the measure of delay. There are 600 feet of this tuunel yet to run, and the work is progressing at the rate of over 30 feet per week. There are 2,000 men employed in and near the Livermore Pass, one-half of whom are Chinamen.

BY RAIL TO SONORA.—The citizens of Tuolumne county appear to be in earnest for a connection of their central city of Sonora with the outside world by rail. A large and enthusiastic meeting has been held to initiate such a project. The entire State, and in fact all the world, is interested in the construction of a railroad from Stockton to Sonora, to the end that all may enjoy the benefit of a shorter and less wearisome journey to the Big Trees and the world-renowned Yo Semite. Sonora, as the terminus of a railroad, would become the depot for an immense extent of country, and would accumulate a large amount of freight to sustain such a work. The great wagon road to Mono would also by that means become a valuable property; and the mountains of Tuolumne would be filled with tourists.

BAD POLICY.—The San José *Mercury* says: "It is no unusual sight to see immense wagon loads of wool and grain pass through San José from the south, hauled all the way by teams for thirty miles alongside of a railroad—the exorbitant freight tariff (ten cents per ton per mile) rendering the old style of freighting cheaper." The citizens of Santa Clara are, in consequence, talking strongly of constructing a short road to connect San José with the Bay, and thence to this city by steamboat, rather than pay the excessive charges of the San José road.

TO VISALIA.—The party recently sent out by the Central Pacific to locate a branch of that road into and through Tulare Valley, report the distance from Shepherd's Ferry, on the San Joaquin, (at which point the branch will connect with the main road,) to Visalia, has been found to be 160 miles. The route is reported as being very favorable. The road can be built inside of a year, and would pass through and open up one of the most fertile regions in the State. The surveying party are now pushing on their survey still further southerly, in the direction of Tule River and Walker's Basin.

OREGON RAILROADS.—The Portland *Herald* says: "That we shall have at least twenty miles of road built this season from this city, we consider it perfectly safe to affirm. In order to secure the land grant this much must be built, and we understand that it is the intention of both companies to build

that distance. Mr. Holladay has gone below to look after the iron, and teams are already engaged in hauling ties on the road." This, we infer, relates to the road from Portland to Puget Sound. It is to be feared that the rival interests which respectively form these different routes for connecting the great agricultural valleys of Oregon with the California system of roads, will greatly retard the ultimate completion of either. It would be well if an early union could be effected upon some one line, and that completed at once. If Oregon once gets a single outlet for her trade, and thereby tastes the advantages which railways always afford, her territory will be rapidly filled up, and capital will not then hesitate to extend such other advantages as her growing necessities may require. We have no doubt but that we shall soon see three roads radiating from the Willamette—the one, eastwise, through Humboldt County in California to this city; a second connecting with our system of roads at Marysville, and the third tapping the great continental road at or near the Big Bend of the Humboldt, in the State of Nevada.

THE UTAH CENTRAL, to connect Salt Lake with the Central and Union Pacific, is now well under way, and will be completed by October—so Brigham Young says.

TRACK LAYING on the Denver Pacific Railroad was to have been commenced at Cheyenno soon after May 1st. The iron for the entire distance is stacked up at the eastern terminus.

MORE OVERLAND ROADS.—The completion of the great Central line has stimulated the managers of the companies on roads pointing hitherward, and has inaugurated definite plans for the construction of at least one additional route; which will probably be fed by several eastern arms; perhaps from St. Louis, Cairo, Memphis, and Baton Rouge, focalized at Albuquerque or Santa Fé, and dispatched to San Francisco over the line to be built from this side, within the next decade.

FAILURE OF THE VELOCIPEDE.—The editor of the New York *Evening Post* pronounces the velocipede "a failure." He bases his conclusion upon these two facts, viz.,—1st, that a mile in six minutes was the greatest speed attained at a recent trial on the Union Course,—and 2d, that "country roads are generally rough." In regard to the first, we have only to say that twice that speed has repeatedly been reached; in regard to the second, that a velocipede does not do well on a rough road simply because that is not the place for it. We should be soon think of pronouncing a locomotive a "failure" because it can't climb a tree. We suspect the editor aforesaid has tried the bicycle, and failed to shine as a performer upon it; and that his pronunciamento is prompted partly by chagrin at that failure, and partly by envy of his brother editor of the *Sun*, who,—he says,—is "the organ of the bicyclists in the United States."

A Two Thirds Interest
OF THE
Golden Rule Mining Company's
Claims and Mill,
Situated in Tuolumne County, California, two and a half miles south of Jamestown, on the Great Mother Quartz Lode. A good 15-stamp Water Power Quartz Mill is situated on the property, with a never-failing supply of water, as can be shown by the last four years continual running. This Claim has three parallel Ledges, from 50 to 100 feet apart, averaging from two to six feet in width, with a length of six hundred feet. They are so situated that a tunnel has been run through them at right angles, making a surface drainage of from seventy to eighty feet in depth on the mine. The mine is well ventilated by shafts from the surface, and well timbered so far as worked. In the mine are steam Hoisting Works, capable of hoisting from a depth of 300 feet. A force of thirteen men only are required to keep both mill and mine running regularly.
On the surface and flats for a distance of 500 feet from these veins, the ground or surface was mined by placer miners, in former years, producing from two to five ounces per day to the man, during the season when water could be obtained, which facts go to prove that a heavy deposit of ore was once contained in the croppings of these shutes, which, by all former and present theories of deep mine workings, came from below, indicating that when sunk upon to a proper depth, the lead will develop a mine equal to the Amador or Eureka.
This claim has paid its 19th regular dividend of $1,500 each, during the past four years, besides all the construction and other expense account, and has levied no assessments during the same time, and at present has on hand $8,000 in the Treasury, and no debts.
The last level 150 feet from the surface rock, averaged $7 per ton, on which was a profit of from $5 to $1 50 per ton. The length of the two shutes of ore on the east vein, and the only one worked upon, has been about 200 feet.
Now I propose to sell two thirds of this valuable property for $16,000, cash; and any party who desires to purchase a property of this kind—which theory has proven that requires depth, on well known shutes of ore, for a sure fortune—can obtain a chance here, providing he or they will go down a sufficient depth. No purchaser is solicited unless he first goes and examines the mine, or sends a mining engineer in whom he can have confidence, to indorse what he may think proper of what has been here stated.
For any further particulars, direct by letter to Wm. Bosworth, San Francisco, P. O. Box 1978, or at my office, room No. 5, over Donohoe & Kelly's Bank.
22v18tfqr WM. BOSWORTH.

International Hotel,
JACKSON STREET
BETWEEN MONTGOMERY AND KEARNY STS.,
SAN FRANCISCO, CAL.
THIS OLD ESTABLISHED HOUSE IS IN PERFECT order for the accommodation of guests. Persons seeking comfort and economy will find this the best Hotel in the city to stop at. The Beds are new and in good order, and the Rooms well ventilated. The Table will always be supplied with the best in the market.
Prices varying from $1 50 to $2 per day for Board and Room.
FINE BATH HOUSE AND BARBER SHOP ATTACHED TO THE HOUSE.
☞ Teams belonging to the House will be in attendance at all the boats and cars to convey passengers to the House FREE OF CHARGE, and to any part of the city for 50 cents

EARTHQUAKE WAVES.—A series of earthquake waves were recorded on the earthquake indicator at Fort Point, early on Tuesday morning last. Intelligence from Japan, the Sandwich Islands, and the South American coast is, in consequence, eagerly looked for.

An arrival at this port, on Thursday last, reports having seen a recent submarine volcanic outbreak, on the 6th of May, four or five degrees to the southeast of Niphon, the largest of the Japanese islands. There was a mass of rocks, about 50 feet high, evidently rising out of the water at the time. An immense volume of steam was ascending, and the rocks must have been very hot, as the surf which rolled in upon them sent up masses of steam, which was accompanied with a fearful hissing sound. It is possible that the disturbance then noticed may have been the precursor of an earthquake which has since sent its tidal wave across the ocean.

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

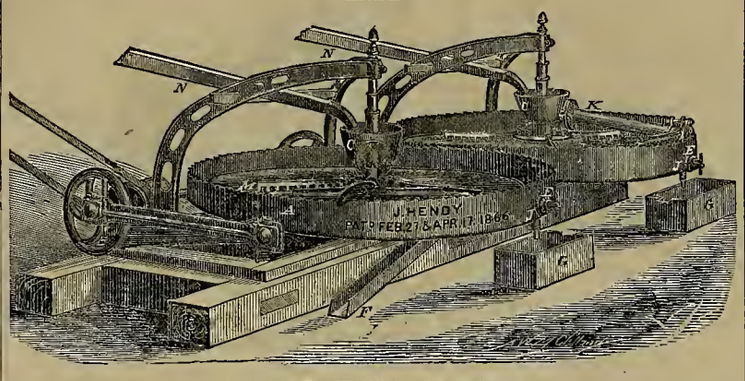
PREMIUM FOR BEST CONCENTRATOR
AWARDED BY THE
MECHANICS' INSTITUTE, 1868,
ALSO AT THE STATE FAIR FOR 1868,
To J. HENDY.



A LARGE NUMBER OF THESE
IMPROVED CONCENTRATORS
ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.
By recent alterations in the patterns for these machines, they are now made
Stronger and more Durable than Ever.

OFFICE OF NORTH STAR MINE, GRASS VALLEY, Nov. 12, 1868.
JOSHUA HENDY, ESQ.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.
Respectfully yours, J. H. CROSSMAN, Supt. N. S. Mine.

J. HENDY, Patentee.

Sheffield Scientific School
Of Yale College, New Haven, Conn.
This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.
The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.
Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.
Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.
Tuition, $125 per year of forty weeks.
The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.
For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

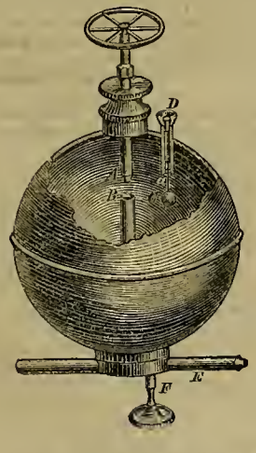
Teasdale's Patent Globe Lubricator.

No other invention has been the prime cause of so many successive improvements as the steam engine. When we contemplate how many times every separate part, and every one of its attachments, have been repeatedly improved, we are met, not by scores, but by thousands of inventions and patents which owe their existence to the original invention of James Watt.



Of this class of improvements, we have for illustration to-day what seems to us a very practical device for lubricating steam cylinders, recently invented by Mr. Geo. W. Teasdale, an operative mechanic and an engineer, recently of Lexington, Santa Clara County, California.

This device is intended to be used where a small but continuous quantity of oil is required, and in cases where it must be introduced against the pressure of steam. It consists of a globe which is shown as broken away, revealing the internal mechanism. The discharge tube, *B*, rises within the globe to near the top, and a conical regulating valve, *A*, stands directly over it, being moved up or down by a hand wheel outside. The oil is introduced through the funnel, *D*, and flows down into the globe which it fills to the top of the pipe, *B*, at which moment the float, *C*, will have risen so as to fit closely in the concavity, *a*, at the lower end of the funnel, thus preventing any further introduction of oil. A small screw plug is then introdneed at *D*, which prevents the escape of the steam after communication is made with the cylinder. Steam from the cylinder will enter the globe through the pipe, *B*, and the small portion which is continually condensing, sinks to the bottom of the globe by its greater specific gravity, thus causing a gradual rise in the surface of the oil and a consequent overflow into the pipe, *B*, along which it flows to the point of application. Whenever the globe becomes filled with water the cock, *F*, is opened, and the water blown out through the pipe, *E*.

The inventor is positive that these lubricators will be found to operate successfully and economically, and we see no reason why they may not come into general use, superseding the various styles heretofore employed. Messrs. Wm. H. & D. M. Moore, brass founders, No. 112 Beale street, are the manufacturers in this city, and will give all desired particulars, and furnish reference to parties who are already using, or testing the advantages of this promising invention. The patent was obtained through this office, and is dated February 23d, 1869. The inventor can be addressed by mail, care of box 17, San Francisco.

RAILROAD LANDS AND THE MINES.—The lands along the line of the Pacific Railroad in this State are rapidly being surveyed—both mineral and agricultural—and sales will speedily follow. The Railroad Act, it should be recollected, provides for the exception of mineral lands; but the timber, even upon that, goes to the road. The idea was no doubt to secure fuel, etc., for the railroad; but the mines are also valueless without timber, and it would be well for those interested in quartz mines especially to look after their interests in this particular, and secure titles from the railroad while they can—for the time is surely coming when timber will become very valuable along all our railroad lines, and will have to be planted to keep up the supply.

HEPBURN PANS, combining grinding with amalgamation, (from a half-inch grain obtained by a cracker) seem to be bearing up well under all tests of inquiry at the Vulcan Foundry, though we do not happen to be possessed of data sufficient to demonstrate to our satisfaction that Mr. Hepburn's claims of greater economy than in stamping, are in reality well founded—our only evidence on that point being the fact that additional pans are being ordered to fit up one or two mills entire, in Nevada, and that quite a number of old style pans have been altered into this. Four pans, we are informed, will grind fine, thirty tons of half inch mesh matter in twenty-four hours; while it takes eight ordinary pans, to amalgamate alone, that quantity. The diameter of the new Hephurn pans is five feet; that of the ordinary ones compared with it, 4½ feet. A 40-ton mill thus arranged is to cost half of an ordinary stamp mill.

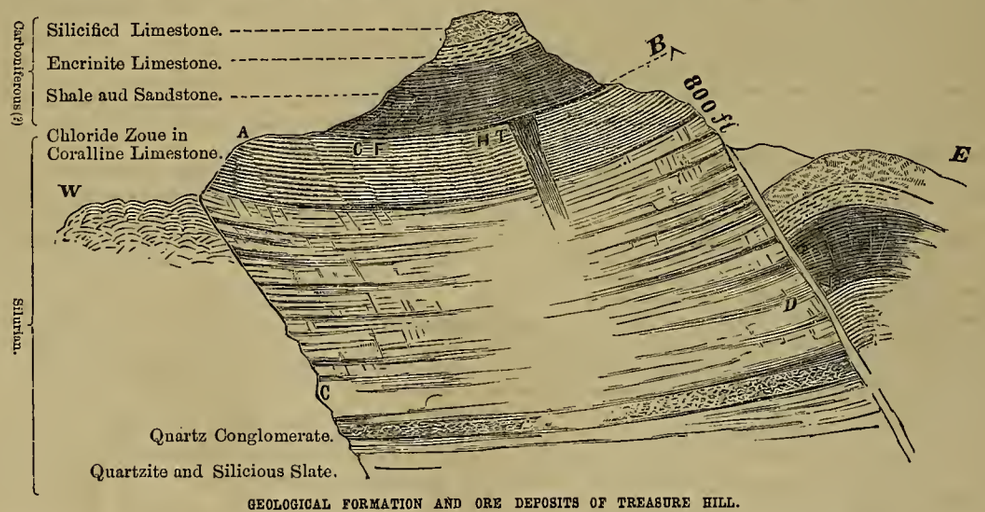
THE OVERLAND MONTHLY.—This magazine has changed hands as regards the ownership only. J. H. Carmany is now the sole proprietor. F. Bret Harte has, as heretofore, the editorial management, and A. Roman & Co. continue as publishers.

The numerous friends of the magazine, who, misled by a rumor that it had changed editors, had feared that its glory was departed, will therefore again breathe freely. It would indeed be a pity if this promising periodical, of which Californians have been so proud, and which has elicited such unmistakable cordial approbation from the Atlantic and trans-Atlantic press, should have a cloud cast over its young life by even a whisper to the effect that it was in danger of falling off. There is no danger. Its friends may rest assured that no bogus jingle is likely to take the place of the genuine ring which they detected in the first number.

OUR ramie plant, which is to supersede cotton, has been sent for by the Pasha of Egypt.

Something More About the Geology and Ore Formations of Treasure Hill.

From several trustworthy sources we derive the important fact that the silver-bearing veins and strata of Treasure Hill, so far as developed thus far by observation, have been found limited in the main to a zone of coralline limestone, measuring about 200 feet in thickness. In places where this conclusion would appear to be contradictory with the facts,—the mines showing a far greater difference of level,—Mr. Clayton informs us that he has invariably encountered evidence quite conclusively to him explaining the difference by a fault in the limestone rocks. In this argentiferous zone, in sedimentary rocks, the precious metal appears pretty regularly diffused; indeed, with such remarkable regularity that the outcropping of a more than usually rich stratum or series of strata commencing on a level with the Hidden Treasure mine, H T, and near the same level as Chloride Flat, C F,—dipping northerly,—can be traced on a slope down the western side, entirely around the northern horn of Treasure Hill, and back on the eastern side in the same plane of stratification, to the place of beginning; the same having been protected from denudation, with its superimposed strata, by a more than ordinarily silicious capping forming the summit of Treasure Peak.



GEOLOGICAL FORMATION AND ORE DEPOSITS OF TREASURE HILL.

The following East and West section across the middle of Treasure Hill, will illustrate some of the more striking points, for which we are indebted personally to Mr. Clayton's observation:

The heavy line A B represents the argentiferous stratum just referred to. Its outcroppings at H T and B are the summit of Treasure Hill—i. e., between its two highest points; the formations above it, as represented over the heavy black line, being those of the northern horn, or Treasure Peak. Beginning at the top, there is, 1, silicious rock to a very great extent pseudomorphous from limestone; 2, encrinitio

limestone, partially silicified; 3, calcareous shale, and sandstone, overlying the limestone A B. Down to this level the fossils are thonght to egree nearest with those of the carboniferous age, while below it they are silurian.

Belonging to the latter is the silver-bearing zone of about 200 feet, represented by horizontal shading; still deeper, quertz conglomerate, and silicious slate formations, which are not exposed anywhere near Treasure Hill, but which come to the surface next underneath the White Pine coralline limestones ebout forty miles further north, in Diamond Valley, on the western flank of Diamond Mountain.

The lines A C and B D represent north and south fissures in Treesure Hill, in which are situated several of the leading mines. They are lines of extraordinary faulting, along which a portion of Treasure Hill eppears to have been elevated e distance of about 800 feet; the evidence for which snpposition rests in the fact that the identity of the silver-bearing coralline limestone has been established at a point 800 feet lower, measured on the line B D, in the neighborhood of its line of outcropping, in a ceñon on the eastern slope of Treasure Hill.

It will be observed that the streta in the central part of Treasure Hill between A B and C D, sag in such e menner as to form a trough. This is in the line of north and south breekage, described by Mr. C., in which are situated the Aurora and the Mahogeny series of cleims. The bending of these strata of Treasure Hill proper into a concave shepe, and at the same time the generel convex curvature of the limestone strata found between B D end Applegarth Ceñon, E, on the east, ere accounted for by the supposition thet the central pert of Treasure Hill wes elevated along the fissures A C and B D, and in the tendency to sink beck it was held in place by the outer fissure walls, the effect of which would be as represented. In the wall west of A C—end everywhere on the western slope of Treasure Hill—the limestone has been eo thoroughly fractured and disturbed that stratification is nowhere to be recognized.

The Eberhardt fisnre is supposed to be the southern boundary of this elevated block; for on the southern unaltered side of thie fissnre the argentiferous coralline limestone strata are again found to appear at a lower level. It must be remarked that this part of Treasnre Hill is by no means the only block, according to Mr. Clayton'e observation, showing evidences of having been fanlted *en masse*. A district of abont four miles square, eituated west of the Shermantown and Swansea Ravine, has been depressed many hundred feet, its rocks being the continuation of the sandstones, shales, and encrintic rocks that form the highest summit of Treasure Peek.

While it is to be admitted that much of geology must necessarily be specnlative, it ie equally true that some of the most extraordinary truths have been revealed to us by its agency with a degree of positiveness never exceeded by any other of the sciences. A fault, whether it be small or great, of hundreds or thoueands of feet, is a thing that can be most easily, and most positively proven, to the meanest comprehension. Faults of more than a mile vertically have thus been found in the earth's crust, and the correspondence of the etrata established beyond a doubt. In regard to the correspondences of Treasure Hill, fnrther data will doubtless comc to light confirmatory or contradictory of the above suppositions. Probably the faulting did not take place simultaneously, nor in anything like the same degree, on the fissures of the eastern and western sides of the mountain, nor would it be confined to two in particular, as is here repreeented for illustration. A geological section is always and necessarily ideal, is often most correct when it ignores detail—and is very apt to be taken for more than it is worth.

We have not indicated the location of all the important fissures, or mines; our object being merely to convey a general idea. Nor is it to be inferred because chloride of silver has been found concentrated chiefly in certain strata, or in that part of the fissures intersecting the zone indicated, thet chlorides or sulphurets may not continue to greeter depths in veins, or even have origineted from a deeper level before encountering the proper conditions for horizontel deposition.

The question arises, in whet manner were the argentiferous limestone strata of Treasure Hill impregnated? Does the extent and the regularity of the diffusion of silver in them edmit of explanation by the ordinary process of ore formation in veins, stockwerks, horizontal infiltrations and intercalations?

The only remeining known character of oro-occurrence that could fit the case, is that of submarine deposit; of which we have perfect exemples in tbe ergentiferous copper schists of Mansfeld, Prussia, aud in the extensive copper schists of the Ural described by Murchison; both of which were formed at the bottom of salt seas or oceans in the Permian age. In the former, mining is now being carried on very successfully in the manner and method of mining for coal; the silver being a snlphuret, and extrected by roasting to sulphate, end leaching. We find iron pyrites diffnsed too in our foot-hill sletes, possessing all the appearances of having been deposited with the slates at the bottom of the ocean in the Jurassic age.

We shall be very slow, however, to accept that es the method of formation of the deposits of Treasure Hill. 1. Because the metalliferous contents of the ocean must always heve been pretty uniform, and can not possibly have been highly concentrated, the greatest degree of concentration being in basins like that of Mansfeld. It is in veins where neture's coucentration is effected. 2. Because the argentiferons strata of Treasure Hill do not extend uniformly over an area wide enough to admit of the existence of an argeutiferous silurian sea. 3. Chloride of silver being soluble in salt water, that substence certeinly cannot heve been precipitated or remeined at the bottom as chloride; the metel must have been a sulphuret, precipiteted probably as the Perm and Mansfeld metals in solution were, by the presence of carboneceous material, which is now found, says Murchison, elways in immediate contact with the metal prccipitated. 4. Sedimentary deposits of silver in connection with limestone rock is an occurrence thet would be new in the annals of mining, so far as our experience extends.

If the deposit of the metal wes sedimentary, the results must not disagree with such points as these: 1. Every ore deposit must have been deposited subsequent to the foot wall, and before the hanging wall; and a single instance of the hanging wall interrupting the deposit would be fatal to that supposition. 2. The ore stratum can ordinarily not contain any fragments of the material of the hanging wall, nor of the foot wall. 3. It is obvious that the ore stratum could not show any continuations or veinlets of ore, or vein material, such as spar, running up into the hanging wall, which did not exist. 4. It must be bent, folded and faultcd everywhcre precisely like the limestone. 5. It will not have any distinct wall with selvage, but is nearly certain to pass gradually over into barren rock, above and below. 6. The distribution of ore is regular, or, in some cases, lenticular, like the *septaria* of the sphaero-siderites in England. 7. A sedimentary deposit cannot show symmetry of arrangement in the sparry material of the opposite walls, such as is often seen in veins.

A layer vein, or infiltration between sedimentary strata, is the result of very different laws, which frequently do not differ much from those governing the formation of true veins.

Familiar Science.

Philosophy of Stale Bread.

Newly-baked bread, although a favorite with all by reason of its peculiar softness and delicacy of favor, is usually avoided, from the well known fact of its indigestible character. The second or third day after wheat is baked it loses its softness, becomes dry and crumbling—or, in common parlance, stale. It is then in its most proper state for food, and actually contains a larger amount of nutriment than when first baked. It is generally supposed that this chenge is dne to the evaporation of its moisture; but such is not the case. Bread loses scarcely any appreciable amount of moisture in becoming stale. This fact may be proven by enclosing a loaf of stale breed in e steam-tight tin, and exposing it for about forty-five miuutes to the heat of boiling water. The loaf on being taken out will be found as moist as when it came from the oven.

In stale breed there has simply been a change in the internal errangement of the molecules, or in the relation of the water to the flour—much like that which takes place when water is mixed with plaster of paris. No apppreciable quantity of water is lost, by ordinary eveporation, in either case; and in both, the water may be nearly all recovered by heat.

When bread is eaten before this chenge takes plece, or before the proper chemicel union is established between the flour and the water, it is in an unfit state to be acted upon by the gastric juice of the stomach, and nearly the entire quantity so eaten is voided from the body as unfit for assimilation into the system. Newly-baked breed cannot remain in the system long enough for the desired change; neither can that change be effected, et all, in the presence of an excess of moisture, either in or out of the stomach.

The quantity of water in well-baked bread, made from good flour, is about 45 per cent. of the weight of the loef. The bread we eat, therefore, is nearly half water. When eaten freshly baked, it is simply a mechanical mixture of baked flour and water, and is almost utterly indigestible and worthless. When eaten at a proper age, it is really "the staff of life"—both meat and drink to the consumer.

Falling of Leaves.—The falling of leeves from trees and plants is brought about by phenomena very much like the process attending the shedding of horne by animals. Although the fall generally takes place at the approach of winter, the cold weather has very little to do with it. It is caused by obstructions in the celluler structure at the base of the foot-stalk, in which they proceed until the cells are completely choked up, although the celle in other portions of the leaf retein their normal condition. These obstructions consist simply of a multiplication of the cell-walls, until the cells themselves become so completely choked that the fluids, which sustain the plant life, can find no passage. The leaf then falls off, as a matter of course.

Explanatory.—Why do wet feet or wet clothes cause us to take cold? Because the evaporation absorbs the heat so abundantly from the surface of our body, that its temperature is lowered below its netural standard; in consequence of which the health is injured. This also explains why it is dangerous to sleep in a damp bed.

Why do not sailors get cold, who are frequently wet all day with sea water? Because the salt of the sea retards evaporation; and (as the heat of their bodies is drawn off gradually) the sensation of cold is prevented. Also, the salt of the sea acts as a stimulus, and keeps the blood circulating in the skin.

Why is the health injnred when the temperature of the body is reduced below its natural standard? Because the balance of the circulation is destroyed, blood is driven away from the external surface by the chill, and thrown upon the internal organs, which are oppressed by this increased load of blood.

Influence of Light on Vegetation.

Humboldt records some experiments nndertaken by a friend of his to sbow the ection of light upon vegetables as follows: "He planted some peas in a box in a darkened room of his dwelling, which, when grown up, were of a yellow color. He also placed some in a room where daylight was entirely excluded, but snspended a lamp so that the rays of light from it would fall upon them. They grew np as green as though they had been exposed to sunlight." He efterwards tried some experiments himself, with the following results: "I planted vegetebles in a place where daylight could not penetrate, over which I snspended a paraffine oil lamp, with a reflector, to throw the light upon the plants. They have grown up a beautiful dark green. I have elso ligbted a greenhouse with lamps every night, and find it not only increases vegetation, but gives a beautiful deep tinge to the plants."

Twining creepers usually turn from left to right; some, however, turn in an opposite direction. The twining action has usually been ascribed to the effects of light. To test this theory, M. Ducharte, a French scientist, rccently tried a series of experiments, which we condense as follows:

Being awerc of the fact that the Chinese yam could live a long while in the dark, he resolved to try the effect of absence of light upon it. At the end of May, he placed one in a pot, and as soon as it showed its stem above ground, took it to a cellar, where it remained in complete darkness until the 2d of August following. The stem, in the course of seven weeks, grew to the length of four feet nine inches. It looked withered and whitish, but was, upon the whole, strong, and even stiff, and perfectly straight, showing nowhere a tendency to twine round the stick which had been placed there for its support. Another yam was planted nearly a month leter, and left exposed to the daylight until it had twined itself round its stick. It was then taken and placed in the cellar, where its stem, still obeying its natural tendency, went round once more, but in a more vertical direction than before; after which it grew straight up along its pole, to which it was fastened as it grew. It wes now again taken out into the garden, where it immediately began to twine round again, meking five close turns; and when it was once more teken down into the cellar, it continued its growth again in a straight line, end so on, eccording as it wes alternately in the light or in the dark. The seme phenomena was observed in several other climbers; but, on the other hand, the bean and the *Ipomœa purpurea* continued to twine around their supports in the dark.

Allow a potato to grow in a dark celler, to which a single streak of light only hes access, and the stelk or eprout will always lean and grow towards the light. The green coloring metter of plante is found in that particular portion of their fluid known as chlorophyll. All plents, in all conditions of plant life, possese this fluid. The flnid is always white, or of a more or less intermediate color between that and green. The coloring matter of the plant evidently depends upon the light. The mysterione influence of thet agency upon plants is as yet but very little understood.

Why Mountains are Cold.

It is a curious scientific fact that the atoms of air as we ascend are at greater distances from each other. If the distance between the atoms is diminished, they give out heat, or render it sensible; whereas if the distence betweeu them is increased, they store it away. The upper strata are sensibly colder than the lower, not because the atoms have less heat of themselves, but because the heat is diffused through a larger epace when the atoms are further apart. One pound of air at the level of the sea, within the tropics, may be said to contain no more heat than the same weight at the top of the highest mountain, perpetually covered with snow. It is for this reeson that the same wind which is warm in the valley becomes cold as it ascends the sides of the mountains. The diminishing pressure allows the air to expand and store away its heat. It is, therefore, not the enow on the top of the mountains which cools the air, but it is the rarity of the air which keeps the snow itself from melting. As a general law the decrease of temperature amounts to one degree Fahrenheit to every three hundred in perpendicular hight.

Mechanical Progress.

Beton Agglomere.

This is the artificial stone which is to win. M. Coignet is the inventor. To establish for it a reputation at once, a gigantic arch was built of it in Paris,—all in one piece. This arch was some 250 tons in weight, and rested upon two supports 200 feet apart. A section of the arch in the center was only about one square yard of surface.

An immense aqueduct 38 miles in length, requiring arches, tunnels and bridges, and a tube six feet in diameter, is now building of the same material. That will be all in one piece also. It was begun in the middle of last year, and according to contract is to be finished in three years. In the first eight months, one-third of the whole was done. M. Michlot, an eminent French engineer, reports as the result of trials, that a specimen of this stone 18 months old, has a bearing strength of 8,000 pounds per inch square. The Government is delighted with it; and has ordered certain bridges, which were to have been built of tubes of boiler iron, to be made entirely of this material.

What is it? Simply sand and lime,—and sometimes a little heavy hydraulic cement,—*with a very little water and a great deal of pounding*. There is the secret. We give the inventor's own words, making no apology for quoting *in extenso*, in view of the importance of the subject to earthquake-fearing San Franciscans:

"I have found that to obtain a stone with sand and lime, it is necessary to dispense with the greater part of the water employed thus far in the manufacture of mortars; water which in excess interposes itself between the molecules of the lime, and prevents the agglomeration of the mass. But, with this reduction in the quantity of water, it is necessary to employ other modes of bringing the grains of sand into close proximity, one to the other, so as to obtain an energetic setting of the lime. In order to do this, I make a mixture of a large quantity of send with a small quantity of hydraulic lime, with or without the addition, as the case may be, of a minute quantity of heavy hydraulic cement. This mixture, sprinkled with only a few hundredths of its bulk of water, is triturated energetically in a mill of special construction, acting by compression and friction, until it assumes the characteristic state of *pulverulent paste* or *pasty powder*, so necessary to the ultimate success of the process. In this state the mixture is thrown into molds, where, by a systematic action of a pounder exerting its power in every direction, and upon successive layers of this pasty powder, the agglomeration is effected in a perfect manner. This does not consist in the employment of new material, but in the mode of employing those already well known; and the effect is so powerful that it multiplies, by twenty and more, the the intensity of the setting of lime. If we make a mortar with three parts of sand and one part of lime slaked and mixed in the ordinary manner, and run this mortar into a mould to make of it a block of one foot cube, in the first place it will require several weeks (nay months) before we can take the block out of the mould. And after one year's exposure, if this block is not destroyed by the effect of frost or the action of the sun, it will crumble into dust under a light weight or by a slight blow. The same material, if properly agglomerated in a mould, may be taken out at once and will resist *absolutely*, as soon as made, the severest frosts and other atmospheric influences, and at the end of a few months it will resist the crushing weight of over 100 kilogrammes to the square centimeter. With a proportion of sand, 5 parts; of lime in powder, 1 part; of heavy cement, 1-4 part, we obtain a block capable of resisting 408,000 pounds to the square foot. With a mixture of sand, 4; of lime, 1; and cement, 1-2, a block of one foot face will sustain a crushing weight of 612,000 pounds. And with the proportions of sand, 5 parts; lime, 1 part; cement from 3-4 to 1 part, it may be made to bear the enormous weight of 1,000,000—*one million pounds and over!*"

Boiler Explosions.—M. Heaffman, of Breslau, publishes a description of some experiments recently made in accordance with the request of the Association of German Engineers. He used a small glass boiler, and found that when the escape pipes were only gradually opened, and the steam allowed gradually to escape, the generation of steam quietly continues, and the water remains pretty tranquil. But if, on the contrary, the valve is quickly opened, steam bubbles suddenly form all through the water, and rising to the surface place the water in violent commotion. In one of these experiments he watched the manometer, while another man quickly opened the valve to allow the steam to escape. As soon as the valve was opened the pressure fell three pounds, but immediately again began to rise, whereupon the boiler exploded. Where it had been in contact with the water it was shattered to powder, which lay around like fine sand. Of the entire boiler only a few small pieces, of the size of a thaler were left. M. Heaffman, thinks the action of the water on the boiler is the same as would be produced by exploding nitro-glycerine in the water. The effect is like an electric shock, and he is of the opinion that escape of electricity taking place during the issue of the steam is in play.

Street Car Axles.—The *Journal of the Franklin Institute* gives a tabular statement of some tests recently made upon Bessemer steel axles manufactured at the Pencoyd Iron Works for the Pennsylvania Central Railroad, and guaranteed to stand five blows from a ram weighing 1,640 pounds and falling 20 feet;—the axle being reversed after each blow. Each axle was made four feet longer than was required, and the surplus cut off to be subjected to the test. Every axle which did not stand it was rejected. The axles were 4⅛ inches in diameter, and the distance between bearings three feet. Thirteen of the twenty-five endured the trial. Two others, in which the test was pushed to extremes, broke, one at the eighteenth, the other at the twenty-fifth blow.

Steam and Exhaust Ports.—The common practice of making the steam enter and leave a given end of the cylinder through the same port, causes a waste of heat, especially with high expansion; because the expanded steam cools the metal which must again be heated at the expense of the next cylinderful. The entrance and exhaust ports should therefore be separate. The exhaust pipe should be double the area of the steam pipe.

The True Plan.—The Cleveland and Pittsburg Railroad have for the last five years offered a prize of one hundred dollars each year, to be competed for by the locomotive engineers employed on the road, and to be given to the one who shall run his engine the greatest number of miles with the least expense. The last years' winner ran 33,—600 miles. The same man has taken the prize three times out of the five.

Tensile Strength of Boiler Plate.—W. M. Henderson has an article in the *Journal of the Franklin Institute* for May, from which we quote: "The tensile strength of good iron boiler plate, at 80,° is about 56,000 pounds per square inch. Its tenacity will be increased as the temperature rises, under the conditions of generating steam, up to 550° above the freezing point; its maximum strength then is 65,000 pounds per square inch. From this it decreases in direct proportion; at double that temperature it loses one-half. As the temperature of the water in a steam boiler rarely exceeds 400°, its application to their construction is especially favorable. For the purposes of calculation, its average strength may be assumed to be equal to 60,000 pounds per square inch. The deduction to be made for single-riveted plates is 44 per cent.; for double-riveted plates, 30 per cent.;—single-riveted, 56; double-riveted, 70. From these data, the bursting pressure, equivalent to the ultimate strength of the single-riveted joint, is reduced to 34,000 pounds per square inch, and the double-riveted joint, similarly, to 42,000 pounds."

Emery Wheels.—Solid emery wheels have lately come into very general use for grinding and polishing. When well made they wear evenly and cut rapidly, and as they require no redressing, but last until entirely worn out, they are rapidly superseding the old fashioned wooden wheel coated with emery, and even usurping some of the functions of the ordinary grindstone.—*Scientific American.*

Scientific Progress.

Spectra of the Stars.

The Engineer illustrates and describes the apparatus used by Messrs. Huggins and Miller in their observations upon the stars made at the splendid observatory of the former gentleman, at Tulse-hill. The large refractor, of 8-in. aperture, mounted equatorially, has an object-glass of remarkable excellence, made, as is also the tube, by Alvan Clark, the celebrated American optician. A star-spectroscope contrived by Mr. Huggins, is attached to the eye-end; and wires from a large induction coil pass to a point in this where are placed two fragments of the substance whose spectrum is to be compared with that of any given star. The sparks taken between these two fragments, furnish the light which is to be so compared; and the observer can produce the sparks at will, by means of a break-piece attached to his chair, enabling him to complete or break the circuit without removing his eye from the telescope.

"The light from the stars is small; and as much of it is lost by reflection in passing through the apparatus, a large telescopic object-glass is necessary to collect plenty of light, and bring it to a focal point. This point of light is lengthened into a fine line, so that it may cover the whole of the slit of the spectroscope. The spectroscope has two prisms. A single prism will not give sufficient divergence of the rays to establish the identity of some of the dark lines; a second prism increases the size of the spectrum in length only, so that the light is not diluted by being spread over a larger area. The light from the ignited substance to be compared with the light from the star, is passed through the upper part of the slit, so is viewed through the same apparatus at the same time. With this apparatus Messrs. Huggins and Miller mapped about eighty lines in the spectrum of the light from *Aldebaran*, and ascertained that the atmosphere of this star contains sodium, magnesium, hydrogen, bismuth, tellurium, antimony, and mercury, besides other substances, some of which may not be known on this earth. The star *Beta Pegasi* contains sodium, magnesium, and perhaps berium. *Sirius* contains sodium, magnesium, iron, and hydrogen. *Alpha Lyræ*, sodium, magnesium, and iron. *Pollux*, sodium, magnesium, and iron. About sixty other stars have been examined, and all seem to have some chemical element known on earth. All the stars in plan of structure resemble our sun in that their light comes from white hot matter, and then passes through an absorbing atmosphere.

Arctic Researches.—Dr. Hayes still urges the importance of another American expedition for the survey of the Polar Basin. His plan is "to complete the exploration of the region north of Baffine' Bay; to trace Greenland and Grinnell Land to their termination; to explore the Open Sea; and lastly, to reach the North Pole. He would enter by Smith's Sound. Capt. Silas Bent, late of the U. S. Navy, on the other hand, conceives that every attempt to reach the North Pole should be made through Behring's Straits or by the Spitzbergen route. These he terms "the thermometric gateways to the pole." His views coincide in many respects with those held by the European geographers.

Evidence Assigned in Favor of a Molten Interior.—According to Professor Palmieri's observations of the eruptions of Vesuvius, the lava currents and the ejections of ashes had two maxima and two minima each day, and these periods suffered a daily retardation; moreover, the time of the greatest and least activity corresponded to the times of the syzygies and quadratures—that is, to those of the spring and neap tides. He concludes that there is within the earth, as has long been believed, not merely local melted matter, but a vast ocean, such as can be affected by tides. He argues that since bodies of water like the Caspian or Mediterranean Sea show scarce any tides, and since the fluidity of lava is far less than that of water, the mass of molten matter must be of vast extent, and that we may well believe the sources of volcanic eruption to be connected in one central molten mass.

Teratology.

This word signifies the "science of monstrosities." M. Dareste has been performing experiments with eggs by submitting them to artificial incubation under unnatural circumstances; in a vertical position, for instance, or partially varnished or glazed, so as to exclude, in some degree, the air. But changes of temperature in incubation, and especially the *mode* of warming the egg, have an important influence upon its normal development; and M. Dareste thinks that by war ming first some one point of it rather than some other point, he can so disturb its progress, as to produce, at will, various anomalies, such as the occurring of two hearts instead of one, one eye instead of two, etc. The experiments are interesting, and the results curious. We give a paragraph or two, translated from his remerks in *Annales des Sciences Naturelles*, for the American *Naturalist:* "The existence of two hearts, which I have had occasion to observe several times, results from an arrest of development which prevents the junction of the two primitive cardiac blastemæ. Cyclopie results from an arrest of development which prevents the two ocular blastemæ, primitively in contact, from separating themselves. This arrest of development is very probably in consequence of an arrest of development of the cephalic cap of the amnios; but I have not yet been able to establish this last fact with certainty. In fact, I have seen that the inversion of the viscera may be obtained when, in one of the malformations of the blastoderm previously indicated, the left region of the vascular area is more developed than the right, and when, also, the temperature of the center where incubation is effected, is relatively low."

Extemporized Compass.—During the discussion at the London Institution of Naval Architects, March 19th, upon the paper read by Mr. Saxby, to which we alluded in our last, the chairman, Admiral Sir E. Belcher, said that he owed his life to his acquaintance with the discovery made by Scoresby, that an iron bar would become magnetic if held vertically and struck upon the end a certain number of blows. When bewildered in the caves of Bermuda on a certain occasion, he took his iron jump, and after striking it in the manner described, suspended it by a string. The polarity it had acquired enabled him to find his way out.

Vinegar from Alcohol.—The difficulty has been that the oxidation of the alcohol is incomplete. But Dr. Artus has a new process. He dissolves half an ounce of bichloride of platinum in five pounds of alcohol, and moistens with this three pounds of charcoal, broken into small pieces. These are then heated in a covered crucible, and put in the bottom of a vinegar vat. The platinum in its finely divided state absorbs large quantities of oxygen from the air,—and the alcohol is oxidized thereby.

The Solar Prominences.—Prof. Henry Morton says: "From the spectroscopic observation made on the occasion of the eclipse in August last and since, there seems little reason to doubt that these promineuces are, in fact, cloud masses of very rare and intensely hot hydrogen gas, thrown out from an atmosphere of the same material surrounding the sun (to a depth of about 5,000 miles) by some violent atmospheric disturbances, such as we have every reason to look for in this luminary. These prominences have, moreover, been seen to alter in shape, and even to be dispersed within a few hours, and indeed they exhibit all the characteristics of gaseous bodies."

Another Martyr.—Professor Jerome Nickles, of the University of Nancy, died in April, from the accidental inhalation of hydrofluoric acid vapor. He had been for some time past engaged in experiments upon fluorine.

Farming and Gardening.

Strawberry Cultivation.

There is a growing conviction on the part of the public that a certain amount of fruit, in its season, is absolutely essential to the physical well-being of man. Thousands, within a few years, have discovered in its use a cheap and wholesome luxury. These facts are made evident in the rapidly increased consumption of all kinds of fruits. It is a noticeable fact that while population increases in different localities only from three to ten per cent. per annum, the consumption of fruit, especially small fruit, increases in three, four and five fold that proportion. This is not only so of San Francisco, but in nearly every city at the East as well. In Boston, where the population increased forty per cent. from 1861 to 1868, the increase in the consumption of strawberries during the same time was over 350 per cent.; and what is quite as significant, the price of the berry has advanced fully 33 per cent. It would appear from these facts that there is very little danger of overstocking the market.

There is no berry now more universally used than the strawberry; and we doubt if there is any which has given higher or more uniform profits within the last ten years. It is the only fruit that grows in every climate, and it is the only fruit that somewhere is picked every day in the year.

To speak of the value of the strawberry to the fruit-grower, and the facility with which it may be cultivated, is like repeating a twice-told tale. We shall therefore content ourselves, at this time, with reminding the farmer, and all others who own or occupy a few rods of ground, and who desire to promote the health and comfort of their families, that they should, by all means, provide them with a good strawberry bed—a very small bed, properly cultivated, will answer. When once started, it will grow and produce good crops with very little care.

Where it is desired to realize the most from a very small space, a rich bed should be provided; a soil containing a goodly proportion of clay, thoroughly and intimately mixed, is the best. Select strong and vigorous, but never *old* plants.

To prepare them for setting, the dead leaves and runners should be carefully removed. There is much difference of opinion as to the space which should be left between the plants. Everything in this respect depends upon the mode of cultivation. If a small bed is to be tended by hand, eight or ten inches will suffice; but in that case no hoe should be used. A fork or dibble might be carefully employed to stir the ground; but the weeds should be carefully pulled by hand, as a system of very small roots is formed near the surface of the ground, which would be destroyed by the use of a hoe. In field cultivation, two or three times that space should be allowed.

FERTILIZERS.

There is, as a general thing, no better dry fertilizer for strawberries than wood ashes. Attention, however, should always be paid to the nature of the soils in the application of fertilizers; but it is always safe to mix ashes with any manure employed. An intelligent Eastern cultivator gives his experience in producing large quantities from a small space in a city garden as follows:

I applied once a week, for three times, commencing when the green leaves first began to start, and making the last application just before the plants were in full bloom, the following preparation; Nitrate of potash, glauber salts, and sal soda, each one pound, dissolved in thirty gallons of rain or river water. One-third was applied at a time, when the weather was dry. I applied clear soft water between times of using the preparation—as the growth of the young leaves is so rapid that unless well supplied with the water the sun will scorch them. I used a common watering-pot, and made the application towards evening. Managed in this way, there is never any necessity of digging over the bed, and setting it out anew. Beds ten years old are not only as good, but better than those of two or three years of age. But you must be sure to keep the weeds out.

TO PRODUCE LARGE STRAWBERRIES.

Another cultivator records the following as a method by which he has been enabled to produce strawberries of mammoth proportions:

Remove the soil around each hill to the depth of half an inch or more, without disturbing the roots; then spread over an area of twenty inches in diameter a pound of finely pulverized linseed meal or oil meal, and cover it over with mellow soil; then spread a mulching of hay or straw two or three inches deep, over the entire surface between the hills. Should the weather be warm and dry, a liberal supply of warm water daily will generally promote the growth of both vines and berries. Pull up weeds, rather than cut them up with hoes.

Cut Grass Early.

A correspondent of the Germantown *Telegraph* cautions the farmers of that section against neglect in cutting their grass too late, as most farmers do. The advice is not inappropriate here, and at this time. A drive of other work is the excuse generally rendered for a neglect to cut grass at the proper time; but it is better to pay double price for help, if necessary, than to neglect such work even for a week. Grass that is fully ripe, so that the seed will scatter out in curing, is not worth the price of cutting, especially if one or two showers should fall upon it, either before or after it is cut. We urged the importance of this matter upon California farmers in our issue of April 24th, under the head of "Philosophy of Hay-Making." Hay is now ripening all over the State, and many farmers are no doubt, as usual, putting off cutting for a more convenient time. Cut your grass while in bloom, or you lose half its value. If you delay cutting until it becomes ripe, it will be worth but little more than straw. The mowing, tedding and raking machines are great helps to the farmer of the present day; and enable him to so hurry up his work as to get the fullest benefit of his hay crop, even when it is a very large one. Farmers will do well to hear these facts in mind, and act upon the suggestions herewith given. It is much better to feed nice juicy hay to your stock, than dried up, worthless straw, that has lost its grain or seed. Buyers, too, in the city and elsewhere, if they are intelligent and know what good hay is, will prefer to purchase that which is cut at the proper time, and will pay a better price for it.

A writer in the *Country Gentleman*, who has had considerable experience in raising stock, speaks of feeding over-ripe hay as follows:

Since being in this country, I fed hay cut when in bloom to working oxen, horses and some hundreds of sheep; it so happened that a late spring and being overstocked, rendered it necessary to buy, which we did of a neighbor who cut his hay late, and the consequence was the whole of the animals had to have extra meal and grain, and then the horses lost flesh, the oxen suffered worse, and the sheep sank shillings per head, and the ewes half starved their lambs. Common sense will tell any one that hay is hay; but straw is a different article; and pray what is any stemmy substance which has matured seed but straw?

APPLES AT THE SANDWICH ISLANDS.—Experiments have been made, which show that apples can be raised on some of the highest mountain slopes of the Sandwich Islands.

FARMING IN FRANCE.—The farming districts in France are decreasing in population. To encourage the people, a society of females has been organized to work a farm of 180 acres.

Fires in the Grain Fields.

The continued and extensive building of railroads through our vast grain regions must inevitably be attended with much loss during the excessively dry seasons which supervene in this State about the time of the ripening of the grain, unless the utmost precaution is used on the part of both railroad managers and grain growers. It is almost impossible to entirely extinguish all the sparks issuing from the smoke stack of a rushing locomotive. Our grain fields at this time are like tinder-boxes, and there is danger from even the smallest escaping spark. Last week 175 acres of standing grain were thus consumed on one ranch near Vacaville, in Solano County. Several other smaller fires were kindled by the same locomotive at other places on the line of the road.

There was, very probably, carelessness on the part of the engineer in this instance, and possibly the railroad company may have to pay for the damage. But it is to be feared that extensive fires *may* be kindled when all reasonable precautions are taken. Railroads are a necessity, and must be operated; and the courts will surely refuse to mulct them for damages when the best known precautions against fire are taken. This, we believe, is the rule of the Eastern and English courts, and it will undoubtedly be the ruling here.

It behooves both parties to take every reasonable precaution to avoid the occurrence of such accidents. Undue proximity to the road in sowing, on the leeward side, may be one of the means employed; and as there is increased danger during the time of harvesting, especial caution should then be employed. Possibly a useful hint may be derived from the following, which we clip from the *Alta:*

A farmer at San Rafael, who has suffered greatly from summer fires, consuming his grain crops and devastating his wild oat summer pastures, finds himself completely protected now by a fence of sorghum in the direction whence the fires come. He sows the seed broadcast, on a strip of land ten feet wide, and it makes a fire-proof fence. A few outside stalks suffer; but the flames do not pass through or over, and thus he gets complete protection. Incidentally, he discovers that the sorghum, fed moderately, doubles the amount of his milk, besides enriching it, and it puts thick layers of fat on the ribs of his cows.

To Make Cuttings Grow.

Much trouble is often met with in securing a proper start for cuttings, whether of small fruits, as gooseberries, currants, grapes, etc., or slips from rose bushes and other flowering shrubs. A very excellent plan is to boil some small potatoes until they are nearly done, and stick one on each slip, before setting in the ground. Very few slips treated in that manner, will fail to sprout and grow with anything like ordinary attention afterward. The potato serves to furnish constant and equable moisture to the cutting, until the stock can throw out little rootlets, of sufficient size to gather it from the surrounding soil. The taking up of moisture by the bare stump is a mere mechanical action, an effort to simply sustain life, until the proper organs can be developed, and the water must be brought in actual contact; that taken up by the rootlets is assimilated, with its due proportion of plant food, and affords nutriment for the growth of the plant.

The trees and plants recently imported from Japan, and those now on their way thither, are kept in a healthy and vigorous condition by having their roots bound up with a preparation made by grinding together earth and carrots. Carrots and similar esculents attract and retain moisture when thus ground up. A preparation of this kind would also be excellent for use in setting out slips or young trees. American gardeners and horticulturists might no doubt obtain valuable hints by a close observation of Japanese and Chinese gardening.

The Coming Harvest.

Judging from the remarks of our exchanges, we infer that the incoming crops, throughout the Pacific Coast, taken as a whole, will be unusually heavy the present year; although in some limited localities the yield will fall short of prosperous seasons. The cereals, in localities where the soil is favorable for the retention of moisture, are unusually heavy; but wherever lighter or more porous soils prevail, these crops will fall short of those of the two years past. But the greatly increased breadth of ground sown will much more than make up for all such deficiencies. In many places the deficiency in yield will be due to imperfect cultivation.

Dry ground, which, when merely scratched, yields only very inferior crops; when thoroughly and deeply stirred with the plow, often produces abundantly. The dryer the season, the more marked is the distinction between deep and shallow plowing. Thorough and careful husbandry is an experiment that has never yet been very extensively tried in California; although it will some day be found full as remunerative here as elsewhere. The generous nature of the great bulk of California soil, hitherto brought under the plow, has led to a negligent and superficial mode of cultivation, which is being attended with much disaster, as it is gradually extended into districts less favorable for such treatment.

In relation to fruits, the prospect is highly satisfactory. The strawberry crops has exceeded all calculations. Cherries and currants are now being marketed in great abundance, and of a quality and size never excelled. Apricots and other stone fruits are beginning to make their appearance, abundant in quantity and excellent in quality. Apples and pears also promise exceedingly well; while the grape crop was never more encouraging.

Oregon papers bring corresponding accounts of the fruit crop in the great Willamette Valley, where the growers are removing much surplus fruit to keep the trees from being broken down with their abundance.

SOIL OF THE FOOT-HILLS.—On most of the hill tops of the western slope of the Sierra Nevada where agriculture has been so sparingly undertaken, it is found that the pulverulent red soil, which constitutes most of the region, will produce without irrigation, from moderate to very good crops of wheat and oats; while for fruit,—apples, pears and grapes,—after one year's start for rooting is given by irrigation, the soil cannot be excelled in the world. To 1,500 feet above the plains, strawberries and other fruits ripen very early. Grass dies in June, however, and stock must be removed during the dry season into the higher Sierra. In some soils alfalfa grass will root to a sufficient depth to continue in growth for months after the wild grass is dead. Hay can be made, but only as grain is raised, by plowing, and by one volunteer crop. Railroad lands are a drug at $2.50 an acre, in gold. The intervening sections of Government land are sold for $2.25 in currency.

THE ROOTS OF PLANTS.—Roots absorb moisture at their tips. If we take a plant, a young tree, for instance, grown in a flower pot, and remove the roots from the soil without much damage, and then arrange it so that the tips of the roots have no contact with water, while the remainder of the tree is in contact with water, we shall find it will wilt nearly as quickly as though the whole plant was out of the water. On the contrary, if we arrange it so that the tip is in contact with water while all the rest is above, it will remain without wilting nearly as long as though all the roots were in contact with the water.

THE best farmer raises the most hay, the poorest farmer sells it.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, June 12, 1869.

Financial.

The fact that our savings and loan societies have again commenced to make loans indicates that their deposits are increasing, a fact which goes far to show that the monetary pressure to which we have been lately subjected is slowly relaxing. Advices from the East, the raising of rates by the Bank of England, the various forms used and demands for cash among ourselves in prosecution of new and costly emprises, the crushing excess of imports over exports, the collection of income tax and attendant locking up of funds in the National Treasury, the necessity for money to move the incoming crops, and a number of other equally cogent reasons, operated to induce an economy seldom practised by Californians. Business has been somewhat stayed on these accounts for the time being, and no purchases were made beyond actual temporary requirements. It is gratifying to add, that this condition of affairs is passing away, and a degree of confidence established in its place which promises well for the future. Our area of commerce and trade has been measurably increased, offering new and inviting fields, which have not been ignored by our business men.

Since our last issue, $1,170,052 in treasure have been shipped to Oriental countries, divided as follows: To China, $150,469 in gold bars, $308,389 in silver bars, $189,872 in Mexican dollars, $91,368 in gold coin, and $3,000 in gold dust—total, $743,098; to Japan, $136,373 in silver bars, $74,431 in gold bars, $216,150 in Mexican dollars. Our shipments via Panama have been as follows: To New York, $50,000 in gold coin; England, $235,366 in silver bars; France, $38,852 in gold bars; Central America, $129,112 in gold bars, $12,046 in gold coin, and $10,000 in silver bars; Panama, $23,200 in gold coin—total, $498,576.

In this market bank rates rule from 1¼@1½ per cent. per month, according to securities. Bullion is in fair supply with equally fair demand, but nothing pressing. We quote gold bars at 870@880; silver bars remain steady at the prices long ruling, viz., from par to ¼ per cent. premium. The export of $600,000 in silver bars in one week has not interfered with the market value of that sort of treasure. Currency bills on Atlantic cities pay 36 per cent. premium on gold; coin drafts, 1⅜ per cent. premium; telegraphic transfers, 2 per cent. premium; sterling exchange, 48¾d; commercial exchange, 49¼d; Mexican dollars command a premium of 5@6 per cent. Gold in New York, June 10th, 139¾; Legal Tendors with us, 72¼@73¾.

The Exports of Treasure from June 1st to date, have been as fellews:

June 1—Per Golden City—		
To New York	$ 87,524 81	
To England	669,360 54	
To France	7,000 00	
To Panama	20 000 00	
		$ 784,485 35
June 4—Per China—		
To China	$743,098 30	
To Japan	426,954 08	
		1,170,052 38
June 9—Per Montana—		
To New York	$ 50,000 00	
To England	235,365 76	
To France	38,852 17	
To Central America	151,158 42	
To Panama	23,200 00	
		498,576 35
Total since June 1st, 1869	$2,453,114 08	
Previously this year	15,970,193 98	
Total since January 1st, 1869	$18,423,308 06	
Corresponding period, 1868	18,080,059 72	
Increase this year	$343,248 34	

Our local money market is not pressed for funds required for legitimate business; but there is no disposition to advance on stock securities or speculative adventures. A great deal of cash has been advanced on mortgages, and is not yet available for business operations, while large sums have been employed in a variety of new and expensive enterprises which require time before making returns. The low prices commanded by farm produce, the uncertainties of the market, and the heavy loans already made on that kind of security, render it difficult for farmers to obtain the sums required to harvest and market their incoming crops; but as bread is a matter of absolute necessity, and the supply on hand is not over abundant, it is quite within bounds to expect that the difficulty will be removed in time to meet all requirements.

City Stocks.

The transactions in securities other than mining stocks during the past week have not been very large. We note sales of Spring Valley Water Co. stock at $66@65 50. A few shares of California Steam Navigation Co. stock were disposed of at 63 per cent. San Francisco Gas stock realized $80 per share. The California Building and Savings Bank announce a dividend of 1 per cent. per month upon their capital stock for the half year ending April 30th, payable on demand. The Bank of Stockton will dishurse a dividend of 1 per cent. on the 15th inst. The People's Insurance Company announce a dividend of 1 per cent., payable on the 10th. The officers of the National Insurance Company give notice that they will redeem their capital stock on and after the 14th of June. This company declined business nearly a year ago. The Buena Vista Vinicultural Society have levied an assessment of $5 per share.

Mining Share Market.

The mining share market since our last similar reference exhibited considerable vitality, if we take into consideration the rather general depression of business in all circles. At the close extensive sales of various prominent stocks have been made at declining rates.

From the White Pine district encouraging news comes to hand with regard to the increased bullion production and the very favorable condition of the various claims. The people of this State have so often been misled and cozened by false representations of unbounded mineral wealth in other regions, that they have come to entertain undisguised suspicion of new diggings reputed to possess unusual attractions. White Pine is near enough, within easy reach by rail, and has been sufficiently long before the mining public to have dispelled any doubt as to its capabilities. The bullion supplies received from that region; the extent of its mines; the amount of silver extracted from given quantities of ore; its volume, and the new discoveries constantly made afford indisputable and tangible evidence of its value.

CHOLLAR-POTOSI—sold at fluctuating rates during the past week. The annual meeting of this Company was held on the 7th inst. During the fiscal year under review, 26,734 tons of ore were extracted—13,292 tons coming from the 800-level. The shaft has been carried to a depth of 300 feet—from the 800 to the 1100-level. From the Secretary's report we make the following statement:

RECEIPTS.

Bullion product	$849,479
Sale of tailings	15,961
Assessment	90,000
Miscellaneous items	14,187
Cash in treasury May 1, 1868	127,683
Total	$1,100,410

DISBURSEMENTS.

Crown Point mine, laber and supplies	$287,853
Mine improvements	9,265
Working 25,833 tons ore	321,688
Legal expenses	4,815
Taxes	10,229
Assaying	7,555
General expenses Gold Hill and San Francisco offices	28,015
Virginia and Truckee Railroad subscription	18,750
Dividends to stockholders	360,000
Miscellaneous items	9,550
Cash in treasury May 1, 1869	42,690
Total	$1,100,410

The ore statement for the past year shows that 25,832½ tons were reduced, yielding $845,627, or an average of $32 73 ₱ ton, as follows:

	Tons.	Average.	Amount.
Rhode Island mill	17,685	$39 93	$546,959
Outside mills	8,148	36 54	297,641
Assay grains	..	..	1,027
Totals	25,833	$32 73	$845,627

The average cost of working the ore for the past year was $11 66, and for mining, $9 80—making a total cost of $21 46 ₱ ton. The assets of the Company on the 1st of May were as follows:

ASSETS.

Cash on hand May 1, 1869	$42,679 76
Rhode Island mill	60,000 00
Mine improvements, building, etc	80,000 00
Stock on hand at mine	33,282 38
Stock on band at mill	27,909 74
A. and P. S. Telegraph Co	493 75
Virginia and Truckee Railroad	18,750 00
Totals	$263,115 63

The only liability against the Company May 1, 1869, was $86,250, being balance of subscription ($75,000) to the Virginia and Truckee Railroad Company. The annual ore statements for the past five years compare as follows:

	Tons worked.	Milling, per ton.	Yield per ton.	Mining, per ton.
1864-65	3,766	$20 00	$36 66	$15 00
1865-66	18,258	15 09	37 73	8 87
1866-67	34,750	14 97	35 91	7 50
1867-68	25,964	13 36	33 25	9 85
1868-69	25,833	11 66	32 73	9 80

The following Trustees were elected for the ensuing year: A. Hayward, Thos. Bell, Thos. Sunderland, J. D. Fry and Robert Sherwood. Subsequently J. D. Fry was chosen President; John P. Jones, Superintendent, and Charles E. Elliot, Secretary. During the week ending June 4th 1,160 tons of ore were extracted, and 1,477⅔ forwarded to the mills. The connection has been made with the Hale & Norcross ground, on the 1100-station north. Tbo daily ore slip of June 7th states that six mills were supplied with 245 tons of ore. The bullion returns for May foot up $131,383.

IMPERIAL—has not been active. There is still no change either in the shaft or south drift. The bullion receipts in May amounted to $42,992 63 against $37,887 83 in April.——SAVAGE sold to a large extent during the period under review at a declino. The receipts of bullion in May foot up $155,000. A dividend of $3 per share is payable on and after the 11th inst.——GOLD HILL QUARTZ reports a hullion product of $5,600 81 for the month of May.

HALE & NORCROSS—has been less active than in the previous week. The receipts for the month of June aggregate $152,780 44. During the week ending June 5th 1,142⅔ tons of ore were extracted, as follows: 175-level, 97; 300-level, 291; 3d station, 51 tons; 4th station, 375⅔; 5th station, 580½ tons; and during the same time 1,147 tons were delivered to the mills, leaving on hand 943½ tons. A dividend of $6 per share is payable since the 10th inst.

EMPIRE—is in slight request. The bullion yield for May aggregates $14,618 37.——OPHIR sold to about the same extent as last week. On the 8th inst. the drift had been extended 343 feet. Tbe rock is as hard as ever, but is changing somewhut in character.——GOULD & CURRY has been in the market to about the usual extent. Timbers have been placed for the new station, but no drifting will be done from the station until tho timbering and sump are completed. Considerable ore has been extracted recently from the upper works of this mine.——AMADOR paid a dividend of $10 per share on the 7th.——SIERRA NEVADA disbursed its first dividend on the 10th inst., amounting to $2 50 per share. They carry over a surplus of $5,000 or $6,000. In May the receipts of bullion amounted to $21,800. On the 6th of July next a meeting of the stockholders will be held, to consider a proposition to increase their capital stock to $3,000,000, divided into 15,000 shares of $200 each.

ALPHA—sold to a somewhat larger extent than usual. An assessment of $5 per share has been levied by this Company.——EUREKA (Cal.) paid a dividend of $7 50 per share on the 10th inst.——GOLDEN RULE (Cal.) will pay its usual dividend of 80 cents per share on the 26th inst.

POWER OF LORD ROSSE'S TELESCOPE.—Lord Rosse's 40-ft. reflector would define a star so far off that its light, traveling at the rate of 190,000 miles per second, would require more than 8,000 years to reach the earth. Some of the stars which we now see with it, may therefore have been, for aught we know, struck out of existence long before Abraham was born; or,—if we follow Archbishop Usher's chronology,—any other man.

A SOBER TRUTH QUAINTLY EXPRESSED.—The Far West is, *par excellence*, the land of effective jokes, and there is often a good deal of solid truth as well as humor in Western repartee. A Virginia City correspondent of an Indinna paper mentions a rather neat hit made by one of the funny fellows of that remote region the other day. A young lawyer who had been employed to condense and put into a better shape the somewhat loose local enactments, complained to the humorist, who was a friend of his, that he found great difficulty in making the required digest. "I'll tell you what you do," said the other. "Ef you want to make a perfeck digest of them ar' laws, you just put yourself through a course of PLANTATION BITTERS, for I wish I may never strike silver if you ken help digestin' anything arter that." This, making due allowance for western hyperbole, was about tantamount to saying that the Bitters are the most potent tonic and stomachic in the world—a truth as self-evident as that all men are born equal.

***

SHORT SIGHTED POLICY—To injure your sight by reading at night, when a good fit from Muller's Spectacle Emporium, 205 Montgomery street, would save the eye for years. *

Job Printing.

We employ the best workmen in this department, and promise our customers—(many of whom have patronized the office for over eight years)—the best of work at very fair and uniform rates.

We are constantly adding new presses, type, and other material to our stock, making our facilities good for doing a wide range of work for merchants, mechanics, inventors, manufacturers, and tradesmen of all classes.

To ENGRAVING AND ELECTROTYPING, for illustrating books and circulars, we pay particular attention, guaranteeing our customers satisfaction in this line difficult to be secured elsewhere.

Printing in colors, bronze, plain and ornamental style promptly done. Especial care given to working engravings

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

ALPINE COUNTY.

Monitor Consolidated Mill.—*Chronicle*, May 29th; This mill is completed, bas heen tested, so far as pulverizing ore is concerned, and pronounced by its managers a perfect success. Now, what is to he done with it?

Pennsylvania.—The ore from the nortb drift, assayed by Wiegand, returns $69.39 in silver and $24.12 in gold; total, $93.51 per ton. Another lot went $20.17 per ton —$17.16 in silver and $3.01 in gold.

Globe.—*Miner*, 29th: Quite a change has taken place in the rock of this tunnel. Samples sbow a remarkable resemblance to the rock in tbe vicinity of the Tarsbish.

BUTTE COUNTY.

Trojan Quartz Ledge.—Oroville *Record*, June 5th: The ledge is situated two miles from Enterprise, on the South Fork, and has been worked two months. We have no idea of tbe amount of gold contained in the specimen brick sbown us, but think there must have heen $700 or $800. The mill produces two of tbese per month, with quartz enough in sight to run a year, and enough further on to last a century.

CALAVERAS COUNTY.

Petticoat.—*Chronicle*, June 5th: The main shaft is being sunk rapidly. No ore will be taken out until a depth of 100 feet below the old level is reached. Labor is progressing upon nearly all of the claims in Railroad Flat District.

Lower Rich Gulch.—Times are lively. Since the completion of tbe steam hoisting works ou the Palomo, active operations have been resumed with exceedingly favorable results. Alexander & Co's 10-stamp battery is never idle.

Wet Gulch.—The recent crushing of 90 tons of quartz from the Lewis Bros. mine averaged $33 per ton. The rock had been assorted. It is estimated that had the rock heen crushed as it came from the shaft it would have yielded $50 per ton. The tunnel for the purpose of tapping the lead below the water level is nearly completed. ....Chapman, Hopper & Co. realized $6,750 from 150 tons of rock recently crushed in Smart's mill at Railroad—an average of $45 per ton....Sandersou, Gay & Co. have a quantity of rock at the mill, which will be crusbed as soon as water can he obtained. The ore is of a high grade.

Gravel Mining.—Paul & Co., near the Junction, who have been running a branch tunnel since December, have struck through into gravel, and are ready to commence washing. The tunnel is 600 feet in length, through solid hed rock....The Golden Gate Co. have been released from their embarrassments, and are taking out gravel of surpassing richness. The water, however, interposes a serious obstacle to successful working, and it has heen found necessary to procure pumps of greater capacity.... The hydraulic claims of J. V. Martin, M. Shaw, Kane & Co., and the tunnel claims of Brackett & Co., Johnson & Co., Ridinger & Co., and many others, are also being worked, with pleasing results.

EL DORADO COUNTY.

Crystal Quartz.—Placerville *Democrat*, June 5th: This claim, near Brownsville, below the Independence, is yielding handsomely. It is now owned by Messrs. Gamlin, Stillwagon & Richardson. A 10-stamp mill erected two years ago, and propelled by water, has of late crushed some rich rock. Mr. Stillwagon brought to town with him a few days ago over $3,000 of fine gold, the result of a run of 24 days.

NEVADA COUNTY.

Eureka.—Grass Valley *National*, June 1st: The Eureka cleaned up yesterday, after a run of six days, 1,936 ounces of amalgam. Four tons of sulphurets were saved during the run, worth $200 per ton.

Idaho.—The gold from a week's run of the Idaho and the mouthly clean-up of the batteries was melted yesterday, and the result was two bricks, worth $13,300.

Clean-up.—Same of 3d: After a run of six days with eight stamps, the Hartery mine yielded $2,527.

Empire.—5th: The Empire bas been yielding some very rich specimen rock. Ore to the amount of $5,000 has heen taken out within a few days from the eighth level. A candle-box full of rock was brought in to-day, whicb literally sparkled with the precious metal.

Geo. B. McClellan.—We saw yesterday some fine specimens of ore from this ledge. The ledge is from four to six feet in thickness, and is particularly rich in sulphurets, worth from $80 to $400 per ton.

Wm. Penn Mine.—Grass Valley *Union*, June 4th: We yesterday saw some spleudid rock from tbe Wm. Penn. The rock showed well in free gold, and had heavy sulphurets all through it. The ledge is clearly defined and large. Tbe specimens came from a depth of 125 feet.

Everybody says the ore specimens from tbe Empire are the richest that have yet heen found in Grass Valley. One piece of the rock weighed 85 ounces, and was said by a good judge to contain $500 worth of gold. The beauty of the thing is, that this rich rock seems to be abundant, botb in tbe eightb and nintb levels.

Union Hill.—6th: The mill will show to-morrow, it is thought, over $500 for two weeks' run.

The North Star is idle. The Empire is short-handed. The Betsy bas not started, owing to the strike. Same of the Garden City.

Gravel Locations.—Nevada *Gazette*, June 2d: The Golconda Co. filed notice of 40 gravel claims yesterday.

Allison Ranch.—3d: A 6-inch plunger pump, to weigh 22,000 lbs., the largest in the State, except that at the North Star mine, which is of same size, has been contracted for.

Gold Shipment.—*Gazette*, June 7th: Marks & Co., at Moores Flat and Lake City, are shipping gold bullion from the two places at the rate of about $35,000 a month. This does not include the quartz gold from Eureka, nor the product of the claims of the North Bloomfield Gravel Co., those companies shipping direct to San Francisco on their own account.

Water Sales.—The Eureka Lake and Yuba Canal Co. consolidated are selling 6,250 inches of water daily on the line of their ditcb.

PLACER COUNTY.

Mount Carmen Claim.—*Herald*, June 5th: Jacob Cowan and A. H. Drake, located a claim between Smith's and North Ravine, two miles from here, a few days ago, aud on Tuesday struck the lead and took out some very rich specimens, one of which, weighing three pounds, yielded, heing pounded in hand-mortar, some $45 in pure gold. They own 600 feet of the ledge.

PLUMAS COUNTY.

Round Valley.—Quincy *National*, May 29th: Judkins & Kellogg, of Round Valley, cleanod up $2,500 for tho last week's run of their mill.

Rumor states that they are working rock at the Indian Valley mine, near Greenville, which yields, on an average, $50 to the ton.

Big Clean-up.—The New York Co., at Sawpit Flat, cleaned up 1,516 ounces of gold dust for their spring's washing, thus far.

North Fork Items.—The old Dutch Hill Co. are putting in pumps. At tbe back end of their tunnel, 1,200 feet from its mouth, the gravel pitched off so as to make this necessary. The claim is considered rich. Ferguson & Wagner have got through with their bedrock tunnel. Their prospects are not as flattering as anticipated. At Carihoo, Thompson & Mather have good dirt in the hill, 300 feet bigher than the old claims. It pays about $5 a day with a rocker. The water is yet too high to permit work in the main North Fork.

Meadow Valley Letter.—The miners are still busy, though in some localities the water is getting very slack. The companies on Gopher and Badger Hills, near Spanish Ranch, had to quit piping on that accouut, some weeks ago.

SHASTA COUNTY.

French Gulch.—*Courier*, June 5th: Hopping's Highlaud mine is prospecting splendidly. The Washington Company have struck a fine looking ledge three feet thick 500 feet from the mouth of their new tunnel. The company have been twelve months in running this tunnel.

Slate Creek.—A man called Frencb bas cleaned up as bigh as 45 ounces in one week, on this stream. The only trouble with the diggings on that creek is their spotted character.

SIERRA COUNTY.

Big Nugget.—Downieville *Messenger*, May 29th: A friend at Little Grizzly, writes that the New Orleans recently found a nugget worth $2,000.

Howland Flat.—Letter to Downieville *Messenger*, June 5th: The tunnel mines are beginning to make a better showing than for some time past. The Union Co. is into ground that pays exceedingly well. The Hawkeye Co. is about prepared to begin breasting, with flattering prospects, after having run a 3,000 foot tunnel to re-open their ground. The Monumental Co. inform me that prospects are improving, which, considering that it has been paying its way, is evidence that tbe chances are good. The Down East Co. is taking out pillars left along their main tunnel. The Pittsburg Co. is not doing a big business yet. The Lone Star Co's claim is paying well. Noyes, Dunn & Co., at Pine Grove, have considerable ground stripped in their sluicing claims.

YUBA COUNTY.

Pennsylvania.—Marysville *Appeal*, June 4th: We learn that the Pennsylvania mill is again in operation, and is expected that the rock about to be crushed will return a rich yield. We hope so. It is time. The mine should be condemned or made to pay. Experimenting has cost heavily.

Same of 5th: The Templer Quartz Mill, with all its machinery, is offered for sale.

ARIZONA.

Upper Hassayampa.—Prescott *Miner*, May 12th: Joseph Young, says the prospects are flattering. C. B. Genung is constructing arastras below the upper cañon to work ore from the Montgomery mine.

Nice Dust.—We saw, the other day, gold dust of the value of $1400, from the hydraulic claims of Jackson, Lovejoy & Co., on Lower Lynx Creek.

Tie-Tie.—The recent trial of ore from the Tie-Tie lode, in Walker's District was not a success. The reason assigned is that grease from the engine, etc., got into the well from which the arastras were supplied with water.

Theodore Boggs, witb four men, started for Big Bug, yesterday, to commence work on the Independence lode.

The Sterling mine is now 17 feet thick. Work is being pushed with vigor.

COLORADO.

Clear Creek.—Central City *Herald*, May 26th: John W. Thackara is finishing the Fairmount Co's mill in Hughle Gulch. John Dumout has commenced work on this creek, near tho Whale mill. He is hunting for the old chanuel. His shaft is 42 feet deep. Judge Colvin is on Trail Creek—building a stone mill. He is working his lode and rushing things. Bennett's steam stamp mill, on Trail Creek, will be ready to start on the 1st of July. Major Cannon is working the Whale, and has found a vein of rich ore, which will he tested in a day or so.

C. C. Baugs, of Idaho, has driven his tuunel on Montgomery Bar, South Clear Creek, 600 feet.

Warren, Hussey & Co. bave shipped $18,500 in gold within tho last two days.

From Georgetown.—Jo. Watson sent down $8,500 last week. The Equator Co. sent 3,000 ozs., and the Terriblo and others sent an aggregate of 1,750 ozs. in bricks.

Russell—Delaware Mine.—At 395 feet from the surface, the lower level east is now 40 feet from the shaft, showing two stroug veins of mineral. The work is done by contract, the men working night and day. The ore is rich, but will not pay in a stamp mill. Assays have been made, showing it to contain from $60 to $200 gold and silver per ton. A small engine is used in hoisting the ore and water. The mill is below tbe mine a few hundred yards. Fifteen stamps are kept busy, and the hest of the tailings saved. A large pile of ore is now at the mine.

North Clear Creek Mills.—*Register*, 27th: The Black Hawk is runuing steadily 40 stamps on Gregory rock, six ounces per cord. The otber 20 stamps are on California rock, second class, from 11 to 14 ozs. Jack Terry is running the old Eagle 20-stamp water mill, on custom rock from different mines, and has all that he can do. Fitzpatrick's 10-stamper is running on custom ore. The Holman 12 stamp mill is leased and run by Fred Conant. One battery is running on refuse rock from the Fiske lode, which yields about four ounces per cord. The other is crushing from the Columbia lode, Quartz Hill. Kimber, Buffington & Garrott's mill is runniug twelve stamps on custom rock. An addition has recently been built, in which have been placed 12 new stamps and 3 pans. Hurd's 20-stamper is running on secoud-class rock from the Kip lode, for B. S. Buell, which yields from three to four ounces per cord. The old Chicago mill is leased by George Wells. They are reducing second class Burroughs ore, five to six ounces per cord, 14 cords per week. They save blanket tailings, and run them in Bertola pans, obtaining from some ores ten per cent. of the gross yield. The old University mill is run by R. W. Mead, on ore from his claims on the Foote & Simmons lode. He is reducing ten cords per week, and obtaining four to five ounces per cord. The mill is a 15-stamper, and run by steam power. The Bobtail Mill is run by H. W. Lake, and is crushing rock from the Kip lode, for B. S. Buell. Nesmith & Mead's new 20-stamper is working steadily on ore from Rogers' mine, on tbe Bobtail, which yields from 6 to 11 ounces. The Holbrook mill, 13 stamps, is run by Ed. Moores and George Dittrich. They are crusbing Foote & Simmons ore in two batteries, and Vasa ore in the third. The former yields from 7 to 9 ounces per cord, and the latter about four. They are reducing 9 cords per week. The old Sensenderfer mill is undergoing repairs. At the Consolidated Gregory Co's 50-stamp mill, 25 of the stamps were undergoing repairs. The others were running on ore from the Geegory, reducing 3½ cords per day, four to five ounces per cord. Tbe section now being repaired has been running on ore from G. K. Sabin's mine, on the Forks lode, whicb yields an average of 8 ounces per cord. A lot of 12 cords of U. P. R. ore yielded 140 ounces gold—equal to 11¼ ounces per cord. The mill is a very fine one—one of the best in Colorado—and was planned for 100 stamps, 50 of which are set up, and the balance on the ground. Woodbury & Norton's fine 24-stamper, is in full operation, on a lot of refuse rock from tbe Prize lode, taken out several years since, and thrown aside as worthless. We understand that it is yielding three to four ozs. per cord. The New York mill is undergoing repairs. An addition has recently been made, and twenty new stamps set up. C. Walker's 18-stamper is at present running on ores from the vasa and Roderick Dhu.

Leavenworth Gulch, &c.—Geo. Mitchell is running his 12-stamp mill on Alps and custom ore, crushing 8 cords per week. G. B. Reed is running the Delaware mill, at the head of Russell Gulch. It is a 15-stamp mill, with a Blake rock-breaker, and is fully supplied witb ore from his mine on the Delaware lode. He is reducing about eight cords per week. Bucklin, Babcock & Elliott have leased the Morse mill, and are runuing it ou custom quartz. It is a 12-stamp mill, with one Dodge crusher, and reduces about eight cords per week. The King Co's 12-stamp mill, near the mouth of Willis Gulch, is on custom rock, reducing 8 to 10 cords per week. In Lake Gulch, Brastow's 20 stamps are on custom rock. Cheney's mill will be in operation again in a few days.

Eureka Gulch.—The Grinnell Central mill is reducing Prize and Burroughs rock, 15 cords per week, 6 to 7 ounces per cord. Jacob Tascher's 18-stamp mill reduces 10 to 12 cords per week, obtaining 6 to 7 ozs. per cord.

Ward District.—Breath & Gross, who are running the Ni Wot mill and mine uuder a lease, have opened a new ore streak on the south side of the vein, from which they are getting a full supply of rich ore for their whole fifteen stamps.

The Briggs mine is producing a large amount of fine smelting ore. Besides this, they are raising more stamp ore than they can reduce, running fifty stamps constantly.

Summit County.—Denver *News*, 26th: Gulch mining has commenced on the Blue, Stilson's patch, Frencb Gulch, Gold Run, Buffalo and Deleware Flats and Galena. Eighteen thousand feet of bar claims have heen taken up this spring on the Snake and Blue. Large parties of prospectors are going down the Blue to prospect the country in and around the Middle Park. Andrew Pedee has sold his lode property in Nigger Gulch, to Cincinnati capitalists. James McFadden has sunk on one of his lodes near Breckinridge, 50 feet. The crevice is eight feet wide, showing a large deposit of galena. The Shock Bros. have struck a rich lode on Gibson Hill and sunk it 40 feet. On Snake river the Potosi is improving. The Comstock sbows a large increase of mineral. The Monte Christo lode improves as deptb is gained; two feet of rich ore in sight. The King Tunnel has been driven into Glacier mountain 400 feet. The workmen bave just struck a large and rich lodc in this tunnel.

IDAHO.

Mining Items.—Owyhee *Avalanche*, June 5th: The Ida Elmore mill is running 15, and sometimes 20 stamps, and is in splendid condition. It is crushing quartz from the Ida Elmore....The New York and Owyhee mill is crushing quartz from the Golden Chariot. The quartz from both mines is rich....The Sinker mill is crushing quartz from the Baxter.

War Eagle Mountain.—Prospecting is carried on over the whole length and breadth. Mr. Sommercamp is on the south extension of the Red Jacket; other parties on the discovery. This mine bas been taken in band by men of energy....In the Baxter ledge, at 200-foot level, very rich ore has been found, witb a ledge of 2½ ft. in width, whence 150 tons of ore is now being milled at tbe Sinker....The Ida Elmore throughout carries a body of rich ore, averaging 2½ ft. in width; the lower 30 feet has a width over five feet....The Golden Chariot is as rich as ever. This mine, whicb is about equal in depth to that of the

Ida Elmore, has a vein larger than any yet met with.

THE POORMAN.—We are informed that a rich strike has been made again in this mine.

MINEAR MILL.—This mill has been rented or leased by Robert H. Leonard, to crush quartz from the Columbia ledge, now being hauled.

SALMON RIVER MINES.—Leesburg letter to Montana *Post*, April 24th: Our miners have commenced work generally. New mines have been opened in almost overy gulch and bar. Caty & Edwards have started at the head of Nappeas Creek with good prospects. Beer, Davis & Co. are working on their flume. In Arnet and Rapp's Gulches they work lively, Ward's Gulch has a large number of miners, and several new discoveries have been made. Work is only waiting for water. Sierra and Bear Track Gulches are now the scene of activity. The Lemhi country, 25 miles from here, prospects well.

MONTANA.

SILVER STAR.—Helena *Post*, May 21st: The two mills which yield more gold than any other two in the Territory, are kept running constantly.

ANOTHER BRICK.—At the assay office we saw a brick which weighed 617 ounces. It was worth, in currency, $15,131. This bar was composed entirely of gulch gold which had been taken out during the week. Another, hot from the furnace, 475 ounces, and of the value of $11,160.

BANNACK.—This town is in full glory. The placer mines are all being worked, and the big ditch is full of water. It is expected that more gold will be taken out this year than any before.

DIAMOND. — Major Davenport reports plenty of water, and every miner working.

JEFFERSON.—A. M. Esler is operating the Williams & Wooden furnace at this place, reducing rock from the Minnesota and Gregory lodes, with good results.

ARGENTA.—Times are improving. The old Esler furnace is now owned by E. Creighton & Co., and starts up at once upon rock taken out during the winter. Wash. Stapleton has purchased an interest in the Toole, Leach & Co. furnace.

HELENA DISTRICT.—A miners' meeting on the 19th, laid over all claims until May 1st, 1870, on account of the scarcity of water.

INDIAN CREEK.—A letter dated 15th says: The supply of water is rapidly increasing, and several companies have commenced operations on the bars and hillsides. Erwin, Thompson & Co. of the White Horse ditch, succeeded in getting water through a few days ago, and Cheat 'Em is once more lively.

VIRGINIA CITY ITEMS.—Alder Gulch is being vigorously worked. Drifts have been run into Eagle Hill from 50 to 80 feet, and the dirt from bedrock yields from one to ten dollars per pan. The water will be let into Hall & Southmayd's flume next week. ....Silver Belt is turning out richly.... Murphy & Co., who have been sinking for bedrock all winter, half a mile below Rochester, struck it about 34 feet below the surface, and found gravel yielding $125 to four pans of dirt....The McAndrew Wann mill has been running the past week on ore from the Julia Holmes.

NEVADA.

REESE RIVER.

The Reese River *Reveille*, of May 29th, gives a statement of the average value of the ores reduced at the mill of the Manhattan Co. during 1867 and 1868. The ores were nearly all from Lander Hill. The average for 1868 exceeds that of 1869, owing to the fact that the ores were more closely assorted. "The whole amount of ore reduced during those two years, was nearly 9,000 tons, which produced about $2,000,000. With the present developments of the mines on Lander Hill, this product might easily be doubled. But to achieve this, the cost of supplies must be reduced at least 20 per cent., and labor must decline in the same ratio. This would reduce the cost of extraction and reduction, and a vast amount of ore, which has now no appreciable value, might be sent to the mill at a tangible profit. The idea of simple chloride and sulphuret ores, worth $80 to $90 per ton, not being mined and reduced to advantage, suggests sharp comments upon our present system."

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

FORT HOMESTEAD TUNNEL.—Gold Hill *News*, May 25th: The southerly end of the railroad tunnel through Fort Homestead is commenced, and a force of hands at work on the outside cut for the face. The northern section is in a very advanced state, and it will not be many days before the connection will be made.

BELCHER MINE.—Little or no ore is being hoisted, and the principal work done is in prospecting, at the 335, 420 and 850-foot levels. From 35 to 40 men are employed. The shaft consists of three compartments, and is 900 feet deep, but the lowest workings of the mine is at the 850-foot level.

FLOWERY.—The last clean-up of 50 tons showed a yield of $24.38 per ton.

BIG CLEAN-UP.—*Enterprise*, June 1st: The Sierra Nevada were yesterday engaged in making their usual semi-monthly clean-up. This will be the largest they have ever made. It is thought that it will amount to at least 70 pounds of retorted gold bullion.

CHOLLAR DIVIDEND.—Same of 4th: The Chollar-Potosi Co. yesterday declared a dividend of $15 per share, payable on the 5th inst. The yield of ore per day is at present about 180 tons, averaging nearly $50 per ton.

OPHIR.—The drift west from the bottom of the new shaft is now in a distance of 325 feet. The rock is still so hard as to make blasting necessary.

TWIN.—This mine, below the Dovil'e Gate, is now looking exceedingly well, about 20 tons per day of ore that will average $35 per ton being taken out. The Atlanta, Sherman and Ione, all small mills, are now running on ore from the Twin.

SALE OF A QUARTZ MILL.—We are informed that Joseph Trench has sold his mill at Silver City. J. G. Foir and J. W. Wackay, of this city, are the purchasers, and the price paid was $50,000.

SIERRA NEVADA DIVIDEND.—Same of 6th: The Sierra Nevada Co. have declared a dividend of $2.50 per share. This is the first time in the history of the mine that a dividend has been declared. The next clean-up will be even better than the last, which was some 80 pounds of gold bullion. Enough ore is now in sight to insure even larger dividends for many months to come. The rock now coming out is the richest yet found in the mine.

BULLION SHIPMENT.—Total during the week, by Express, 9,002 pounds, of the value of $239,706.71.

HALE & NORCROSS DIVIDEND.—The Hale & Norcross have declared a dividend of $6 per share, payable on the 10th inst. The mine is looking well.

GOULD & CURRY.—The station timbers are now put in, and a drift east commenced, near the bottom of the shaft.

WHITE PINE.

EBERHARDT.—Treasure City *News*, May 31st: "We yesterday paid a visit to this mine. On the point between the Keystone and Original Eberhardt, a force of workmen are engaged blasting and breaking down a huge mass of rich chloride ore which crops out on the surface. Further to the southward is another force breasting on a level with the Keystone works, toward the main building. At this point also the ore comes to the surface, and is of high grade. There is, perhaps, not less than 800 ton of ore, of high and low grade, on the several dumps, and this amount is rapidly increasing, notwithstanding 20 to 25 tons are daily shipped to keep the two mills of the company, at Shermantown, in motion. The large tunnel or chamber leading from the original Eberhardt cut to the Blue Bell shaft, a distance of 100 feet through solid ore, which milled high up into the thousands, is on an average of about 12 feet in hight by 25 in width, and is securely braced with double sets of timbers on either side. Above and below this ample chamber one continuous mass of ore of fabulous richness meets the gaze. Along the entire length of the western wall in particular, is to be seen a stratum of chloride from one to four feet in width, uninterrupted in its course, save where it is occasionally supplanted by pure horn silver of such vast richness that the mark of the pick and drill are clearly discernible as if stuck into a pig of lead."

The same of 3d says: We understand that the Eberhardt yesterday struck a splendid body of high grade ore in the Keystone shaft, at a depth of 145 feet.

Same of 4th: The Keystone shaft in the Eberhardt mine, unearthed an immense chunk of horn silver yesterday, about the size of a flour barrel.

C. C. F. COMPANY.—*News*, May 4th: The mine of the Consolidated Chloride Flat Company is the most thoroughly prospected in the district. It is honey-combed with drifts. We visited it yesterday. In all of the drifts through which we passed, one continuous mass of the finest grade ore was to be seen above and below and upon either hand. It is impossible to estimate the extent of the deposit, notwithstanding the great number of tunnels and drifts that have penetrated it in every direction, for none have yet reached the termination of the ore. To close up, in a word, the whole of Chloride Flat appears to be literally bursting with one vast mineral deposit of of the rarest value, and to the Consolidated Chloride the most of it belongs.

CONSOLIDATED HIDDEN TREASURE.—Two inclines are sunk on the ledge, in which developments of the most encouraging nature are being made.

MILLS.—*News*, 3d: Work on the Metropolitan Mill, at Shermantown, progresses finely. The ten pans are all in position, and yesterday the huge battery blocks were being placed. It is believed that this mill will be ready to steam up within the next twenty days....We understand that the Stanford Brothers have determined to immediately erect a 30-stamp mill near the town of Eberhardt for the reduction of the ore from the California mine....The 8-stamp mill of Moyle & Sears, near Shermantown, started up on the 1st.

We understand that the old Manhattan mill, brought from Washoe by the Consolidated Chloride Company, will steam up either to-day or to-morrow, adding 20-stamps to the milling capacity of White Pine.

The price of reducing ore, is $30 per ton, delivered at the mill in quantities of 100 tons or more.....Same of 4th: Work commenced Monday, in 'Eberhardt City,' Menken Cañon, to level the ground for a large, new mill, which the California and Aurora Companies will erect as rapidly as possible.

MILL FOR PATTERSON.—Messrs. Murphy and Seal, left a few days ago for Patterson District, with a view of making arrangements for the erection of a first class quartz mill in that section.

WORK RESUMED.—In our daily rounds, on Treasure Hill in particular, we notice preparations being made in all directions to commence the work of prospecting in earnest during the Summer campaign. Yesterday the Golden, Napoleon and South Beecher Companies, each started up work.

ORE SHIPMENTS—Will not now fall short of 200 tons per day. This will be doubled as soon as mining facilities are provided.....The Hidden Treasure yesterday shipped for milling, 50 tons. A portion goes to the Newark mill, and the ballance to one of the mills at Hamilton..... The Rattler Company will commence shipping ore on Monday next for milling, a contract having been effected with Messrs. McCone & Dunn for the reduction of 200 tons. About half of the amount is now on the dump.....A thousand pounds of ore arrived yesterday from San Francisco District, situate 65 miles to the southeast. It is to be shipped immediately to San Francisco, where its value is to be tested.

BULLION SHIPMENTS.—3d: Agency of Bank of California shipped yesterday and day before, fifteen thousand dollars bullion, for the Consolidated Chloride Flat Co., and eleven thousand dollars for the Aurora South and other mines....The following shipments were made yesterday: By Wells, Fargo & Co., from Shermantown, four bars valued at $6,580.08; from Hamilton, 6 bars, valued at $8,299.44; by First National Bank, Hamilton, one bar valued at $1,828.99, and by Agency of Bank of California of this city, $26,000, making a total of $42,708.51.....We saw yesterday, at Hamilton, the first brick turned out by the Treasure Mill. It was the result of ore worked from the Nevada mine, and bore the following inscription: No. 1. Oz., 14,028,90; fine, 990: value, $1,828.99; J. W. Bailey, agent. It is to be sent overland, to the President of the Company, in Indiana.

PENNSYLVANIA TUNNEL.—This has penetrated the hill 60 feet, and advances two feet per day. It is believed that 50 feet additional will be sufficient to tap the Sanderson ledge at a depth of 100 feet from the surface.

WHITE PINE WATER WORKS.—Work is progressing satisfactorily. The tunnel, 370 feet in length, through the hill north of this city, is already completed, and the pipes are being delivered on the ground. Much of the machinery to be used in raising the water has also arrived.

A fine body of ore has been struck in the Good Omen, on Pocotillo Flat.

OREGON.

GOLD ON THE MOLALLA RIVER.—*Oregonian*, May 29th: Wm. Sprague has discovered rich surface diggings along the bed of a small tributary of the Molalla river, called Lost Coffee Creek, which will pay from $3 to $5 per day to the hand. These diggings extend along the creek eight miles. The creek runs through a deep cañon in the Cascades, inaccessible to horse or wagon. Sprague has sold one sluice right and 300 feet along the creek to Wa Kee, of this City, for $750, who will place a large number of Celestials to work. The mines are 58 miles east of Oregon City, far back into the Cascade range.

WARREN'S DIGGINGS.—The *Commercial* has the following extract from a private letter May 9th: We are still at work on the Rescue and the prospects are flattering. We have a shaft about 70 feet deep—good ore all the way down. The gold worth $13 per ounce. We will have 50 tons of choice ore for milling the last of this week. It cannot yield less than $70 per ton. The ledge grows larger and wider as we go down.

WYOMING.

Sweetwater Mines, May 26th: Atlantic Gulch, mined a short time last year and abandoned, has been struck richer than ever and the whole gulch re-located. One nugget was found weighing $57 53. The gold is all coarse. Mining is progresing to some extent in Rock Creek.

A splendid Ledge has been discovered on the west side of Willow Creek, and called the "Mineral Wealth".

Pease & Co., are running their arastra on Mary Ellen rock.

Foreign Patents.

Henry Bessemer, the inventor of the Bessemer steel process, has lately applied for five British patents. The first is for improvements in the manufacture of malleable iron and steel, and in furnaces and apparatus employed for their fusion and treatment.

Second. Improvements in the construction and mode of working furnaces and apparatus employed in fusing malleable and wrought iron and steel, and pig or other carburets of iron, and obtaining cast steel or other malleable iron therefrom.

Third. Improvements in the conversion of fluid crude iron and molten pig or other carburets of iron into fluid homogeneous malleable iron and steel, etc.

Fourth. Improvements in the treatment of crude or pig iron and other carburets of iron, and in the apparatus employed for such purposes.

Fifth. Improvements in the construction and mode of working blast furnaces employed for smelting the iron ores, and in the mode of employing and utilizing the gaseous products of such furnaces, and also in the construction and mode of working blast engines employed to force air into blast and other furnaces.

Railroad Building in the Metropolis and the Wilderness.

The following is the commencement of an article upon the Pacific Railroad in *Engineering* for May 14th: "Two years after the Bill for the Metropolitan District Railroad was sanctioned, the charter of the Pacific Railroad had become a law of the United States, and in less time than has been required to build some ten miles of City line, nearly 2000 miles have been laid across the American Continent. These two undertakings present the strongest possible contrasts of engineering construction, the one taking its course through a densely populated Metropolis, displacing its thousands of artizans and its hundreds of shopkeepers; the other penetrating through wild deserts, disturbing but the deer and buffalo herds, and the predatory hands of Indians. This one requiring ground, each inch of which has to be valued, bought and economized; that one acquiring land grants by millions of acres.

The Metropolitan Railway, built foot by foot, through all the difficulties of surrounding property that had to be maintained, through the complicated network of sewers, gas mains, water conduits, telegraph tubes; the Pacific Railway advancing in its progress as much as six miles a day, across the level prairie, unhampered by any difficulties save those of nature, and costing little more than 7000*l.* per mile.

On Promontory Summit, beyond Salt Lake, 1083 miles west of the Missouri river, and 672 miles east of Sacramento, the last link of the great iron chain was added on the 8th of thie month; the last 20 ft. rail required to complete the 1850 miles was secured to its sleepers, and the great work, no less important than the severance of the Isthmus of Suez, far more promising in its future, and more fraught with difficulty to its engineer, was practically finished."

DR. HAYES.—The Geographical Society of France have decreed a gold medal to Dr. Hayes, of the United States, for his eminent services in the work of Arctic exploration and diacovery. The President of the society, with a deputation of members, waited upon General Dix, the American Minister, and presented the medal.

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Traveling Agents.

Wm. H. Murray, California.
Dr. L. G. Yates, California.
Isaac G. Street, Oregon.

Resident Agents.

Oakland.—W. B. Hardy.
California and Nevada—S. H. Herring.
Sacramento—A. S. Hopkins, No. 70 J street.
White Pine District.—Alex. Bruckman, Hamilton, Nev.
Treasure City, Nev.—J. L. Robertson.
Shermantown, Nev.—T G Anderson.
Helena, Montana.—E. W. Carpenter.
Black Hawk, C. T.—Harper M. Orahood.
Central City, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.
Georgetown, C. T.—John A. Lafferty, Postmaster, is our agent in this place.
Denver City, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.
Cheyenne, D. T.—Mr. Robert Beers is our authorized agent for this place.
Omaha, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.
London.—Oco. Street, 30 Cornhill, E. C.
Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

San Francisco:
Saturday Morning, June 12, 1869.

Notices to Correspondents.

Electro-Metallurgist, San Francisco.—Faraday has found, as a general rule, that the salts of the magnetic metals are themselves magnetic, provided that these metals entered into the hase of the salts. As an instance, crystals of proto-sulphate of iron placed in a thin glass tuhe, which is not magnetic, will cause tho tube to point axially. Such salts will preserve their magnetic properties, even when dissolved in water. If the solution is placed in a glass tuhe constructed for this purpose, so as to retain the contents when placed horizontally, when suspended by a loop of copper wire and a few fibres of silk in that position, will be found to take an axial position hetween the poles of a magnet. Solutions of sulphate of nickel and sulphate of cohalt act in a similar manner to the solutions of the salts of iron.

Saturn, Sacramento.—The age of the glohe we inhahit cannot he expressed much better than in the words of Professor Owen, who has observed that "the time which it has revolved in its orbit is so great that present evidence strains the mind to grasp such eum of past time with an effort like that hy which it tries to realize the epace dividing that orhit from the fixed stars and remoter nebulæ. Yet during all those eras that have elapsed since the Camhrian rocks were deposited, which hear the impressed record of creative power as it was then manifested, we know, through the iuterpretatiou of these 'writings on stone,' that the earth was vivified by the sun's light and hoat, was fertilized by refreshing showers, and washed hy tidal waves."

Ku-li.—The Yang-tse-Kiang is called by the Chinese "The Girdle of China," as it traverses the whole of the center of China. No river in the world possesses ou its banks such a numerous population, estimated at upwards of one hundred millions of inhabitants, or more than three times the number found in the Uuited States. On its shores are to be found moro than 100 cities, of the first, second and third classes, and 200 towns aud villages. From its source in Thibet, to its embonchure, its course extends over 3,000 miles, and the basin drained by it covers 800,000 square miles. Hang-Khow forms probably the greatest exchange mart throughout Asia.

Aquatic.—Great sea-waves have been treated in the ablest manuer by Professor Bache. The article alluded to cau be fouud in a work published by him, in company with a paper "On the Tides of the Atlantic and Pacific Oceans." These works were puhlished at New Haven, in 1856.

Immense quantities of bat guano have been found on Lookout Mouutain, Tennessee. It is believed to be superior to the Peruvian guano.

The vines in Franoe are diseased, aud in many parts of the wine districts tho crop e said to be totally destroyed.

Under-Current Sluicing and Sulphuret Saving at North San Juan.

In addition to what was said in the Mining Press on this subject last week, we give the following particulars:

The American mine, situated a mile below San Juan, nearer Sebastopol, is 1,500 feet above the Middle Yuha, and is one of the hest paying, best managed hydraulic mines in the country. Its outlet is through a cut and tunnel, in granite, of 2,200 feet in length; after which there is about half a mile more of rock-paved sluicing to the river. For sluice bottoms, granite hlocks 10x8x4 inches are to a coneiderable extent used in the place of the ordinary wooden blocks; but, unless these are set vertically with the cleavage plane, they are not much to be preferred to wood, except in the matter of durability, which furnishes an ample offset to the expense.

Certain strata in the mine are of the hard, compact, more thau usually rich pyritiferous cement, which is characteristic of the ancient river deposits. This, it has been found, after long experience, yields in the ratio of ahout $900 when crushed and amalgamated in a stamp mill, to $500 when treated in the ordinary manner by sluice amalgamation. Stamping direct is therefore resorted to in the working up of this strata. The rest is washed through a total of three-quarters of a mile of rock sluicing, with a grinding head, as stated, of 1,500 feet.

Bnt instead of restiug content with this very thorough treatment, Mr. Brown, the foreman, has hrought into use, in the course of the descent to the river, seventeen under-current sluices, each from forty to fifty feet in length, and from twelve to twenty feet iu width, two of which are under-current sand sluices, intended mainly to catch sulphurets.

The plan is to clean up the rock sluice helow the first undor-current sluice in the series as seldom as possihle, relying upon the more delicate, broad distrihuting and nicely-adjusted undor-current sluices, paved with wooden blocks and longitudiual slats, for the arresting aud amalgamation of the gold. The main sluice, down to and including the first under-current at the mouth of the tunnel, is paved partly with wood, and is cleaned up once in fourteeu days, or an average, including stoppage for cleaning up and repairs, of every three weeks. The nexteight uuder-current sluices aro cleaned up every other run, or each of them onco in twenty-eight days, and in such a manner as to alternate, four of them heing cleaned up at the end of one run, and the four alternating ooes at the uext. The remainiog five or six amalgamating sluices are cleaned up once in every three months. The sand sluice (only one as such heing at present ruuniog) is cleared off whenever the boxes are deemed sufficiently filled.

As the latter arraugement differs from the other under-current sluices only in substituting for blocks, elats aud quicksilver, a succession of cross slats, or hoards, eeveral inches in hight, and about four feet apart, behind which are caught the heavier sand and sulphurets, whilst the lighter are washed away again into the main sluice,—nothing more is uecessary in cleaning off than to remove the cross slats and let on a stream of water for a few minutes. The concentrated pyritiferous sand obtained was formerly ruu down iu a separate couduit to the sulphuret mill, built Mr. I. S. Crall, at the foot of the ravine. It is now sized in Germau sizing boxes, aud thence let into one of Jenning's sulphuret concentrating sluices (described heretofore), which throws off the lighter half of the matter into the main sluices, while the comparatively pure sulphurets only are carried down to the mill.

Here they are wasbed through a shaking sieve, aud grouud up in the presence of quicksilver iu a Crall'e "waltziug pan," which does not differ in principle from the Hanshrow planetary pan, heing merely a very large excellently devised grinder and separator comhined.

Touching the assay value of concentrated "water sulphurets," as the miners designate all which are not "quartz sulphurets," the only test that has heen made has resulted in $40 to the ton. For some reason or other, the number of tons actually worked does not appear to have been very large thus far.

To give an idea of the efficiency of the under-current amalgamating sluices, the first in the series cleans up from $300 to $800 to the man, in exact ratio to the clean-up of the sluice ahove it; and the very last one in the series, at the river's edge, yields $50 to the ton. The river tailings do not pay Chinamen to work.

From seventeen to eighteon tanks of quicksilver, altogether, are in the sluices at once; of which about half a ton is lost to every clean-up. The tank holds from seventy-five to eighty pouuds, and costs about fifty dollars.

The owners of the Amorican mine—Messrs. J. H. Brown, A. B. Swan, George Spooner, S. M. Crall, etc.—have spent about $20,000 on the processes to work tailings, with the foregoing results; which, thongh they do not appear to be fully satisfactory in the matter of returns, are sufficiently so to have warranted all the attention and outlay that has hcen hestowed upon the subject.

Improved Prospects in Humboldt County, Nevada.

In further evidence of the reawakeuing of mining operatious in Humboldt County, we notice the organization of tho Great Central G. &. S. M. Co., whose existence arises from the fact just discovered that it will pay to ship the Humholdt cupriferoue silver ores to this city by railroad for Swansea. The mattor has been nicely figured down, and there is a margin clearly in favor of the miners, on ores assaying only in the neighborhood of $100 iu silver and gold. Copper of from 7 to 50 per cent. is tho ingredient that necessitates shipment, and that renders the ore at the same time especially marketable at Swansea. The Central Company have commenced operations on the Juno ledge, Battle Mountaiu District, distant from Battle Mountain station about six miles, to which reference was made under "Minerals, etc.," last week.

The White Cloud miners are also at work, and in excellent spirits. A batch of ore brought down by the railroad quite recently, assays $875 Ag., $290 An., and 48 p. c. Cu., or ahout $2,000 per ton, and is under test of smelting at North Beach.

Twenty-five Per Cent.—According to a certificate shown to us by Mr. Constahle, signed by L. B. Hopkins, Superintendent, and Dan. Abell, engiueer of the Nevada mill, Virginia City, the Carvalho superheater introduced there eome months ago, has resulted in a saving of 25 per cent. of the fuel previously required. All is effected by so simple an invention as a coiled hot wire in the hot steam tube which prevents the steam from partly condeusing to water, which of course is uo longer expansive.

The Colorado Canon.—Professor Powell's exploring party did not succeed in getting down the Colorado Cañon last season, it appears. Four portable boats were to be procured hy him this season in Chicago, and brought out by Pacific Railroad to Green River, for a fresh etart. Mrs. P. does not accompany the second expedition.

Distinguished Visitor.—Hon. Wm. H. Seward is now ou his way overland to this State, in accordance with a long-cherished purpose to visit California. He will probably deliver the address at the alumni meeting at Oakland.

Bedrock Tunneling.

Three or four great tnnnels are going into the ancient river channel at Smartsville and Timbnctoo, where mining appears to he carried on still as vigorously and as profitably as ever. Six men and a blacksmith, working night and day, are, in O'Brien's tnnnel, accomplishing with the nse of giant powder, at present, ahout six inchee a day, the rock being diorite, or "hlue granite." In the old tunnel into this claim the rock was found so hard that a few rods of tunneling cost thousands of dollars. Mr. O'Brien pays $40 a foot. By following qnartz veins, however, the cost has in several cases been reduced two-thirds. Deep placer mining seems to all intents and purposes as permanent an interest as vein mining, for there is no greater likelihood of the former heing any sooner exhausted. At the head of the Smartsville Consolidated claims, to he opened in depth hy the Crary tunnel, (which ie two-thirds completed, only 800 feet remainiog) there will soon he exposed a vertical bank of auriferous gravel over 300 feet in hight, which is to be worked away if possible through tho ridge to Mooney's Flat, the grouud baving been proved to he all rich. How much lava cement cappiug can be dealt with, or to what extent tunneling underneath like ridges wonld be found practicable or economical, are questions that must receive atteution soon iu this vicinity.

Farming Engines.

Messrs. Palmer, Koox & Co. havo lately heen hurried with work on portahle engines for driving threshers and other machinery, aud are making some improvements in the same, rendering the engines more euitable to the times and locality. This class of machinery is being rapidly adopted into favor by California farmers.

Tho agricultural locomotivo engine, which has been huilding at tho Goldeu State Foundry for Byrou Jackson, of Woodland, Yolo County, made its first trial on Thnrsday last, whon steam was got up for the purpose of driving it to tho wharf of the steamer New World, where it is to be shipped to its destination. This engine, which is tho first of its kind that has ever beon built on this coast, is a modification of Aveliug & Porter's (English) eogine. It has an 8-iu. cylinder with 12-in. stroke, link valve motion, and will work up to a maximnm of oighteeu horse-power. The driving wheels are six feet in diameter with twelve inch face, aud are geared to the eugine by chaiu in a ratio of 12½ to 1. The engine is steered aud assisted, if need be, by two horses, and attains a speed of 2½ milos per hour. The weight is seven tons without water, and about nine tons with water in both boiler and tank. The tank contains a supply for ahout three hours' run. This constructiou admits of moving a heavy engine from placc to placo without a large team. We hope soon to report the building of draft engines for common roads.

Cheap Stamp Mill.—A very cheap stamp mill of redwood, and having only the lower end of the stamp and the dies of iron, may be seen under construction in frout of John Clark's carpenter shop, Harrison street, near Third. It is for a Mr. Eastman, somewhere this side of White Pine, in Nevada. The extreme simplicity of a wooden stamp mill, as well as its durability when properly coustructed, are points worthy of a little attention by those who own good mines, yet who are in want of capital.

Grasshoppers have made their appearance in large numhers in Idaho, and it is feared that they may do great damage to the coming crops.

Oregon Grain Crop.—It is estimated that the grain crop of Oregon will be 33 per cent. greater this year than last.

The Grass Valley Strike.

The strike at Grass Valley still holds ont, and is beginning to be felt as a serious matter by the merchants and business men of that town. They, together with the miners themselves, will be the only parties who will be seriously punished by the untimely and ill-advised movement. In the meantime the wide notoriety given to the affair, will operate as an advertisement to the cheap and skilled mining labor of Europe, to seek in this State, at lower than present prices of labor here, a far more remunerative occupation than they can find at home. In the end, the mill owners, for whom punishment alone was intended, will be the only parties who will reap solid and substantial benefit.

The strikers are still holding meetings, and the report is they are increasing in numbers. They exhibit no disposition to be noisy or demonstrative; but there is evidently a deep seated determination to carry out their programme at all hazards. The way they operate may be inferred from the following paragraph from the *National* of the 2d inst: "Day before yesterday a man who had been hired at the Empire mine, came out of the shaft, changed his clothing in the dry house, and then started home. In a few minutes he returned and told the undergrounnd foreman that he could not work any more, as he had just been warned not to do so."

This is a pretty strong use of "moral suasion," and one which may lead to difficulty. The mine owners are quite as firm as the miners; but as the amount of the stake played for, and the ability to hold out the longest is altogether on the side of the former, there is no uncertainty in the mind of any intelligent man, as to what will be the ultimate result; although the road thereto may be just what the latter may choose to make it.

The Bellingham Bay Mines.—The fires in these mines are again in full progress, and are reported to be extending. No sooner had the waters which drowned out the firea of 1866 been pumped out, (a nine months' job), than new fires were ignited by spontaneous combustion, the work probably of decomposing iron pyrites. Between the fire and water there appears to be but little choice at Bellingham Bay. Nanaimo shipped 1,372 tons of coal in April.

White Pine News.—This daily comes to us enlarged in size, and with a new and handsome head. The heavy paper upon which it is printed, and its comfortable appearance generally, indicate anything but failing mines in the region upon which its hopes are based. It evidently believes,—as well as says,—that White Pine is all right yet. Success to it.

The First Fruit Overland.—Fifty pounds of apricots, grown by W. Carpenter, at Smartsville, Yuba County, were shipped overland a week ago. This will probably be the first California fruit seen in the Eastern market, the climate of the foot-hills in that region being noted for its peculiar adaptation to early fruit raising.

Idaho Transportation. — Two new places on the Pacific Railroad are spoken of as depots for Idaho. Indian Creek on the Central Pacific Railroad, 240 miles from Boise City, and Corinne on the Union Pacific Railroad, 200 miles from Boise City. The latter place has already a population of 1,500, and Bear River Valley adjacent is claimed for ranches twenty miles.

Mr. Sutro, the originator of the Sutro Tunnel project, arrived in this city a few days since. He thinks he will soon be able to commence work on the tunnel.

Continental Life Insurance Company, 203 Montgomery street, corner of Pine.

California Academy of Sciences.

At the regular meeting of the Academy, on Monday evening last, Edward Cohn, Hugo Eloesser, Arthur Eloesser, Dr. J. Van Zandt and Major George H. Elliott, U. S. A., were duly proposed as resident members.

Some limestone fossils were presented from W. H. Sears, Treasure City, and crystallized gold in crystallized quartz, from Mr. Warren, of Amador.

The resignation of T. A. Mudge, as Recording Secretary, was received and accepted.

Mr. Yale, as Committee on Outside Lands to be conveyed by the city to this Association, asked for further time in order to make a further abstract of the title. He desired that Col. Ransom be associated with him in order that a proper survey of the land be made to accompany his report. On motion, Col. Ransom was added to the Committee.

President Blake referred to a visit he had recently made to Petaluma. Whilst there he visited the locality where the bones of a mastodon were found. He saw only some small pieces, the large ones having been previously removed to San Francisco.

He examined the effects of the earthquake of last October upon the country around, and found its force more distinctly visible in the rocky portion or mountain range, while the marsh or alluvial soil was comparatively undisturbed.

Disturbances among the Elements.—New York harbor and vicinity was visited by a severe tornado on the 28th ult. It took up such quantities of dust from the beach at Long Branch as to completely envelop vessels passing at the time a full mile from the shore. Several vessels lost spars and sails. In the Sound, near East river, a regular water-spout was formed, and a row-boat was taken up a hundred feet or more high, carried over a boat-house, and landed quite a distance beyond.

About the same time a terrible hurricane visited the Miami Valley, Ohio, doing a large amount of damage. Hailstones are said to have fallen as large as a man's clenched fist. The overland mail of the past week also reports the occurrence of quite a severe earthquake shock in Georgia. The vibrations lasted ten seconds. Another earthquake is reported at Helena, Montana.

Historical Sketch.—We have received from the publishers, J. H. Carmany & Co., a neatly-printed pamphlet of forty pages, giving a Historical Sketch of Calvary Presbyterian Church, with a full report of the late dedication services of the new church, including the sermon on that occasion by Dr. Wadsworth. The pamphlet is accompanied with a very fine wood engraving of the new edifice. Aside from its value as a brief history of one of the oldest and most important religious organizations on the Pacific Coast, the mechanical execution of the pamphlet is also a credit to the office from which it has been issued.

We hereby acknowledge the receipt of the Annual Report of the Crown Point G. & S. M. Co., for 1868-9, which has been issued in the highest style of the art typographical; the 14th Annual Report of the Odd Fellows' Library Association; a report of the celebration of the 50th anniversary of Odd Fellowship, under the auspices of the White Pine Association at Shermantown, and a Lecture on Sanitary Reform by F. M. Shaw.

Cost on Sleeping Cars.—The charge for sleeping cars on the Central Pacific is $5 extra for each half section, including two seats and a bed for two, from Sacramento to Promontory Point; or $10 for seats and beds for four. The cost of passage ticket to the same point is $50—all in gold. The first "Pullman" sleeping and dining car arrived at Sacramento on Thursday evening last.

In England a farmer does not work nor own land—he only hires it. He who does the work is neither farmer, contractor, nor proprietor.

Mining Progress.

New Gold Mines.—Col. Drew, who left Sacramento, some two months since, with a party, on a scientific prospecting tour, has returned to that city, according to the *Bee*, and reports having discovered gold and silver at the head of the South Fork of the Owyhee. He reports the finding of some very rich rock. The Colonel returns for supplies and an efficient outfit for developing the ledges which they have located. This locality must be about 120 miles north, of Austin, and is probably a southern continuation of the mineral belt of Southern Idaho.

New Mines in Arizona.—A party of miners arrived in this city a few days since from a locality in Arizona, where they have been prospecting and mining about two years. They bring with them rich specimens of gold, silver and copper. Their object is to organize a company of about thirty experienced miners, to return and work the newly-discovered diggings. The party will be armed with revolving rifles, as the neighborhood is infested with Apaches. Further information in regard to these mines can be obtained at 413 Kearny street.

Work to be Resumed on a Copper Mine.—The Nevada *Gazette* says that work is about to be resumed on the Thorp or Fox copper mine, the discovery of which, some two or three years ago, created considerable excitement. A shaft was sunk at the time to the depth of 155 feet, and considerable quantities of ore extracted, some of which was brought to this city and sold for a good price. The paying ore, however, was found in small seams, of from two to ten inches in width, while the width between the walls is a little over thirty feet. Mr. Thorp is confident that further explorations will develop a large body of ore, and he is now negotiating for a small engine, with the purpose of sinking 200 feet deeper. The engine will be used only for hoisting purposes, as there is no water in the mine to contend with. Mr. Thorp has secured from the railroad company a title to the land on which the mine is situated.

New Almaden.—The Grass Valley *Union* is authoritatively informed that the expense of labor in the New Almaden quicksilver mines, which has heretofore been about $40,000 a month, can, by the use of Giant powder and single handed drills, be reduced to $30,000. The miners object to the change, and it is probable the mine will be closed until men can be found who will work the new explosive. Mr. Butterworth, the superintendent, has recommended such a course.

Coal Oil in Oregon.—Professor Veach, now temporarily in Oregon, has discovered a coal oil spring near Albany, on the farm of Mr. C. L. Burkhart, of that State. Whether or not the oil exists in sufficient quantities to prove of any benefit has not yet been determined, owing to the nearness of the spring to the Willamette River—the water being the only barrier to a thorough examination.

Big Nuggets of Copper.—A large mass of native copper weighing about 3¼ tons, was recently shipped from Lake Superior. It required four span of horses to haul the ponderous weight to the dock. This, we believe, is the largest single mass of native copper ever taken out from a mine. A few days afterwards another nugget, weighing 2¾ tons, was shipped from the same point.

Zinc.—The Lake Superior *Miner* says: "We have scarcely begun to raise the ores of zinc, but the metal abounds in all quarters. Its discovery in workable quantities caught science napping, but until she comes up with some economical method of freeing the ores from sulphur, this element must, to a great extent, remain in its native bed."

Accident Fund—A Good Idea.—At the North Star mine, Grass Valley, every miner pays fifty cents a week into what is called an Accident Fund, to be disbursed to disabled or sick miners and their families. The disbursements for April last were $381. The idea is a most excellent one, and should be generally introduced. The Reese River *Reveille* says that a similar fund was established at the Florida mine, a year or two ago by Major Sherman, the then superintendent.

Diamonds.—It is said that a lucky miner has found two or three very valuable diamonds in the gold mines of Nova Scotia, one of which is valued, in the rough, at $300,000.

Company Transactions.

New Incorporations.

The following new companies have been incorporated:

Land Reclamation Co.—San Francisco. June 8th. Capital stock, $12,000,000; Trustees: George G. Roberts, A. C. Peachy, Lloyd Tevis, Sol. Heydenfeldt, and — Dorsey.

Western Land Association.—San Francisco. June 8th. Capital stock, $60,000, with privilege to increase to $240,000. Trustees: L. H. Foote, W. Andrews Navel, C. W. Wilson, J. Rolph, E. Chattin, J. Lloyd, and G. S. Ingersoll.

Pooonip & Othello M. Co.—White Pine, Nev, June 9th. Capital stock, $1,600,000. Trustees: G. W. Beaver, Mark Livingston, George Oulton, F. F. Low, and C. L. Low.

Prince Imperial M. Co.—White Pine, June 9th. Capital stock, $1,400,000; 14,400 shares, $100 each. Trustees: Paul Rougset, F. F. Oison, A. W. McPherson, F. Levey, and R. R. Hammond.

Merchants' Homestead Association.—San Francisco. June 9th. Capital stock, $54,400; 136 shares, $400 each. Trustees: William Monahau, T. P. Riordon, John Calvert, C. H. McCurrie, Emlen Painter, J. G. Burt, and G. C. Randall.

Stockton Park Homestead Association.—San Francisco. June 10th. Capital stock, $99,000; 60 shares, $1,650 each. Trustees: H. H. Bancroft, Geo. L. Kenney, W. H. Knight, P. J. Merwin and G. A. Shurtliff.

Seal Rock G. & S. M. Co.—White Pine, Nevada. June 10th. Capital stock, $1,000,000; 10,000 shares, $100 each. Trustees: E. V. Sutter, L. M. Gautier, H. J. Tilden, Wm. Cotter, and Gabriel K. Stevenot.

Arizona Mineral Exploring Organization.—White Pine, Nevada, June 10th. Capital stock, $1,500,000; 500 shares, $3,000 each. Trustees: F. E. Ketchum, W. H. Trainor, J. S. Maxwell, Daniel McLean, A. P. K. Safford, Felix O'Brien and Matthew Stakum.

Meetings, Elections, Etc.

Wheeler M. Co.—White Pine, Nevada, June 7th. Trustees: L. Sawyer, S. F. Reynolds, M. H. Myrick, C. W. Jones and H. P. Parker.

Hearst M. Co.—White Pine, Nevada, June 7th. Trustees: A. Hayward, D. D. Colton, J. O. Earl, S. M. Wilson, and Geo. Hearst. President, D. D. Colton. Secretary, Charles E. Johnson.

San Buenaventura Commercial Manufacturing and Mining Co.—June 8th: President, Edward Conway. Secretary, W. L. Ustick; Trustees: W. H. Patterson, E. R. Carpentier, F. F. Vassault, Edward Conway and C. J. Hutchinson.

Ascendant M. Co. June 8th. President, L. L. Alexandor. Vice President, Albert Shepard. Secretary, D. McLaren.

Pinto M. Co.—June 8th. President, E. J. Moore. Vice President, R. C. Johnson. Secretary, D. B. Arrow Smith. Trustees: E. J. Moore, R. C. Johnson. Peter B. Forster, H. B. Laugley, R. Mayrisch, C. P. Schmidt, and David H. Jackson.

Paul Traot Homestead Association.—San Francisco, June 7th. President, H. F. Williams; Vice President, S. S. Arnheim. Trustees: H. A. Crane, A. B. Stout, L. Gerstle, M. L. Citron, W. M. Larmour, John Burns and T. H. Hatch. Treasurer: W. C. Ralston; Secretary, B. F. Wilde.

Geological Changes.—A redwood log, two feet in diameter, was struck, a few days since, at a depth of over 200 feet below the sea level, in boring an artesian well upon the place of Judge Billings, in Santa Clara. When that log was growing, the ground upon which it stood must have been at least 250 feet higher than it now is. We have here indubitable evidence of a subsidence of the Santa Clara Valley to that extent. The lateral pressure which elevated the mountains on either side of that valley must have depressed the intervening country, just as in the shrinking of an unripe apple, the skin rises in ridges parallel to corresponding depressions.

Potatoes.—Every bushel of potatoes raised, takes from the soil a quarter of a pound of potash. This suggests application of ashes to potato ground.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Plans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.
San Francisco, May 1, 1868. 18v16tf

Globe Iron Works,

STOCKTON, CAL.

KEEP & BARGION,

MANUFACTURERS OF

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers,

High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

Mining Progress.

THE CALIFORNIA PACIFIC, connecting Vallejo with Marysville, and thence mountainward, is being pushed ahead with vigor. Measures are also being taken to secure whatever business may be brought to the main trunk by means of branches. With this end in view, arrangements have been made with the Napa Valley road, by which that road will hereafter be run in perfect harmony with the California Pacific. This latter road will in a few weeks reach the northeastern boundary of Yolo County, where it will cross the Feather River at Knight's Landing. The company intends to relay their track from Vallejo to Sacramento with heavy iron, in order to enable the trains to be driven with great speed, to meet the river opposition. The work of re-laying will go on gradually, so as not to interfere with the regular running of trains. The old iron will be used for branches, side tracks, etc. All the iron for the company's main road from Vallejo to Marysville has arrived.

SAUCELITO AND HUMBOLDT.—Work on this road has been suspended, whereat the people along the route are very much vexed, and pronounce its inauguration a trick of the projectors of the new town of Saucelito to sell their lots; which accomplished, they have no further use for the road, and stop work. There may be other roads more needed than this just at present, and those which do not interfere so much with existing monopolies; but a road will soon be called for over this route to meet the growing wants of this city for suburban residences, if for nothing else.

THE WESTERN PACIFIC.—Mr. Strobridge, the energetic manager of the Central Pacific track-layer, is now at work upon the Western Pacific, with a large number of men, between Oakland and Vallejo Mills. The employment of Mr. S. is a promising augury of the speedy completion of this last section, which is to connect the great overland railroad with this city. It is intended that grading and track-laying shall be pushed with increased energy on this end of the Western Pacific, and that the connecting rail with the Sacramento end will be laid at or near the crossing of the San Joaquin.

OREGON AND CALIFORNIA ROAD.—The Central Pacific Railroad Company appears to have entered in earnest upon the enterprise of the construction of a railroad from Marysville to Chico, having the Columbia River as its ultimate objective. Several lines have already been run between Marysville and the Honcut, to determine the most feasible route. Four or five surveying parties are now out on various parts of the line, one of which is on a route via Pitt river and Klamath Lakes, and the entire route to the Columbia river will soon be definitely located. Negotiations appear to have failed for the purchase of the Oroville road, as a part of the line, and the company appears to have commenced work upon an independent route to Chico, more direct than via Oroville. It is expected that a force will be put on sufficient to build the road to Chico the present season. Another season will be sufficient to reach Shasta. From that point northward towards Oregon, the work will be heavy; but the company that has built a road to Salt Lake in six years will not be materially retarded by anything between Sacramento and Oregon.

OREGON AND MONTANA.—A company is now seriously considering the matter of constructing a railroad easterly from the head of navigation on the Columbia, for meeting the growing demands of the Montana trade. The *Oregonian*, speaking of the project, says: "The navigation of the Columbia is established from the Pacific ocean to Wallula, nearly 300 miles in an air line. From here to Pen d'Oreille Lake is a distance of 250 miles. Over this distance a road can be built in quite a direct line, without encountering any serious obstacles. Then we are within easy reach of the heart of Montana." It is believed the parties who have the matter in hand are in earnest, and that they will soon commence active operations.

IDAHO.—The sale by the Union Pacific of all their rights west of Ogden, involves the abandonment by that company of their projected branch to Idaho; whereat the Idahoans are in much tribulation, lest they may have to "stage it" for years to come, to make their connection with the Central

Pacific, and the rest of the railroad world. If Idaho pushes on the development of her mines for a few years longer with the same success as has attended her efforts in the past, we presume the enterprising managers of the Central Pacific will be ready, at the proper time, to extend them all needed railroad facilities.

BRANCH TO DENVER.—The telegraph of Monday last says: Arrangements have been made by Gov. EVANS for the early completion of the Denver Pacific Railroad. He starts East to-morrow to complete a contract with the Union Pacific for laying the track and equipping the road.

DUTIES ON COPPER ORES, REGULUS, ETC. The duties on copper ores, metallic copper, and copper furnace products, under the recently established tariff are as follows: On all copper imported in the form of ores, three cents on each pound of fine copper contained therein; on all regulus of copper, and on all black or coarse copper, four cents on each pound of fine copper contained therein; on all old copper, fit only for manufacture, four cents per pound; on all copper in plates, bars, ingots, pigs, and in other forms not manufactured or herein enumerated, including sulphate of copper or blue vitriol, five cents per pound; on copper in rolled plates, sheets, rods, and all manufactures of copper, or of which copper shall be a component of chief value, forty-five per centum advalorem.

ILLINOIS
SILVER MINING COMPANY
White Pine District.

Trustees:
JAS. H. CUTTER, B. H. FREEMAN,
E. H. SHAW, JAS. R. CARNISS,
DAVID BUSH.

The Company's Mine adjoins the celebrated "Silver Glance," and is in close proximity to the "Argyle," and other prominent mines of the District.

From developments already made, the Trustees feel justified in saying to their friends that this is one of the best opportunities ever offered for investment in this State.

For the purpose of further developing the mine, the Company has set aside a limited amount of stock, to be sold as a working capital, of which they now offer 1000 shares, at the nominal price of $2 50 per share, unassessable—the entire proceeds of which will be devoted to developing the mine.

The books of the Company are now open for subscription at the office of the Company, No. 432 Montgomery street, Room No. 1, first floor. By order.

JAS. H. CUTTER, President.
G. W. STEWART, Secretary.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skilful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

QUARTZ OPERATOR'S
HAND-BOOK.
—BY—
WHEELER & RANDALL.
San Francisco, 1865.

A cheap and handy book for Quartz Prospectors, Millmen, and Amateur Assayers.

This little work, of 130 pages, although partly devoted to a discussion of limited interest to general readers, contains instructions in the WORKING AND ASSAYING OF ORES, AND TABLES FOR REFERENCE, which renders it quite desirable and of frequent service.
Price, $1, coin—$1 30 in currency or postage stamps. For sale by DEWEY & CO.,
Mining and Scientific Press, San Francisco.

Our Patent Agency.
The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Pins—How They Are Made.

The pin machine is one of the closest approaches that mechanics have made to the dexterity of the human hand. A small machine, about the height and size of a lady's sewing machine, only stronger, stands before you. On the back side a small helt decends from the long shaft at the ceiling that drives all the machines, arranged in rows on the floor. On the left side of our machine hangs, on a peg, a small reel of wire, that had become straightened hy rnnning through a compound system of small rollers.

The wire descends and the end of it enters the machine. This is the food consumed hy this snappish, voracious little dwarf. He pulls it in and hites it off hy inches, incessantly, one hundred and forty hites to the minute. Just as he receives each hite a saucy little hammer, with a concave face, hits the end of the wire three taps and "upsets" it to a head, which l e grips into a conuter-sunk hole between his teeth. With an outward thrust of his tongue he then lays the pin sideways into a little groove across the rim of a small wheel that slowly revolves just under his nose. By the external pressure of a stationary hoop these pins roll in their places, as they are carried under two series of small files, three in each. These files grow smaller toward the end of the series. They lie at a slight inclination on the points of the pins, and hy a series of cams, levers and springs are made to play "like lightening." Thus the pins are pointed and dropped in a little shower into a hox. Twenty-eight pounds are a day's work for one of those jerking little automatons. Forty machines on this floor make 560 pounds of pins daily. These are then polished. Two very intelligent machines reject every crooked pin, even the slightest irregularity of form heing detected.

Another automaton assorts half a dozen lengths into as many hoxes, all at once and uuerringly, when a careless operator has mixed the contents of hoxes from various machines. Lastly a perfect genius of a machine hangs the pins by the head in an inclined platform through as many "slots" as there are pins in a row on the papers. These slots converge into the exact space spanning the length of a row. Under them runs the strip of pin paper. A handlike part of the machine catches one pin from each of the slots as it falls, and by one movement sticks them all through two corrugated ridges in the paper, from which they are to be picked hy taper fiugers in houdoirs, and all sorts of human circumstences.

An interesting inquiry connected with the above is—

WHAT BECOMES OF THE PINS.

This question has often been asked, hut we have never yet met with a satisfactory answer. Few persons are aware of the enormous consumption of the useful little instrument. The annual report of the Secretary of the Treasury, ten years ago, contained some interesting memoranda relative to manufactnres, furnished hy Hon. Phillip Allen, then Senator from Rhode Island, in which, among other things, he stated that the number of pins made per annum in the United States was two billions, six hundred and seven millions, three hundred and sixty thousand. Now the old question comes up for solution—what becomes of the pins? The population of the country was then twenty-six millions. Does each individual—man, woman and child,—consume one hundred pins a year? for that would be the average supply. But it is well known that it is only one sex who use pins at all. Does each example of the feminine gender consume two hundred pins a year? From habyhood to maturity, and from that to the grave, the passion for pins, it is admitred, is n part of woman's nature; hut we submit that this fact affords no satisfactory explanation of the disappearance of twenty-six hundred and seven millions of pins per annum. The questiou remaius—what *does* become of the pins?

THE ENGLISH PATENT SYSTEM.—The *English Mechanic* calls for reform. It wants a cheaper system, oue that will make patents more valuable, and less assailable. There is now a surplus patent fund amouuting to $2,000,000, out of which it is suggested that an industrial and inventor's museum should he estahlished and endowed. It is also urged that the present patent fee should be reduced one-half. The injustice of charging such exorbitant fees is shown hy the surplus which has accumulated.

ANOTHER SHIP CANAL.—The cutting of a great ship canal from the Bay of Biscay to the Mediterranean is projected. The cost is estimated at ninety millions of dollars, and the time required at six years.

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

The following is a revised list of books interesting to our more spccial readers. The newest and most complete treatises on subjects within the scope of this paper, includiag local maps, pamphlets of value, etc., will he added from time to time:

ANTISELL.—The Mannfacture of Photogenic or Hydro-Carbon Oils, from Coal and other Bituminous Substances, capable of supplying Burning Fluids. By Thomas Antisell, M. D. 1 vol. 8vo.. 3 00

BARSTOW—Sulphurets; What they are, How Concentrated, How Assayed, and How Worked; With a Chapter on the Blow-pipe Assay of Minerals: 1 vol. 12mo. cloth 1 00

BLAKE, W. P.—Annotated Catalogue of California Minerals. 8vo 50

BLAKE, (W. P.)—Report on the Precious Metals at the Paris Ex., 1869. (To be hed through Members of Congress.)

EVANS—White Pine. 25

FREY & WELL'S Topographical Railroad and Coun y Map of California and Nevada.. 1 50

FEUCHTWANGER — Treatise on Gems. 6 00

GOODYEAR'S Translation. A Treatise on the Assaying of Copper, Silver, Lead, Gold and Mercury, from the German of Th. Bodeman and Bruno Kerl. 1 vol. 12mo. cloth..... 2 50

HITTEL'S (JOHN S)—Resources of California; comprising Agriculture, Mining, Geography, Climate, Commerce, etc., etc; the Past and Future Development of the State. 12mo., cloth. 1 50

HOSKOLD'S Practical Treatise on Mining Land and Railway Surveying, Engineering, Etc. 1 vol. 8vo. cloth..... 16 00

KUSTEL.—Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada; also, a description of the General Metallurgy of Silver Ores. By Guido Kustel, Mining Engineer. illustraied by accurate engraving. 1 vol. 8vo cloth..... 5 00

KUSTEL.—A Treatise on Concentration of all Kinds of Ores: Including the Chlorination Process for Gold bearing Sulphurets, Arsenurets, and Gold and Silver Ores Generally. By Guido Kustel, Mining Engineer and Metallurgist. Illustrated with 120 diagrams on 7 plates. 1 vol 8vo. cloth..... 7 50

LAMBORN.—Rudimental Treatise on the Metallurgy of Copper. 1 vol. 12mo. limp cloth. Illustrated 1 00

MITCHELL'S Manual of Practical Assaying. 1 vol. 8vo cloth..... 10 50

MAKINS.—A Manual of Metallurgy, more particularly of the Precious Metals, including the Methods of Assaying them. By G. H. Makins. 1 vol. 12mo. cloth. Illustraied by upwards of 50 engravings..... 3 50

MAPS—Of Oregon, Idaho, Mexico, White Pine, etc., can be had at Bancroft's and Gensoul's.

OVERMAN (Fred.)—A Treatise on Metallurgy; comprising Mining, and General and Particular Metallurgicel Operations. 1 vol 8vo. cloth. 7 50

PHILLIPS (J. ARTHUR) — Mining and Metallurgy of Gold and Silver. New edition.) 8vo. cloth..... 15 00

PERCY (John). — Metallurgy; the Art of Extracting Metals from their Ores, and adapting them to various Purposes of Manufacture. Iron and Steel. 1 vol. 8vo. cloth. 13 00

PLYMPTON—Practical Use of Blowpipe. 1868..... 2 00

Practical Usc of the Blowpipe; bcing a Graduated Course of Analysis. 12mo. cloth. New York, 1858 ..... 2 00

SCOFFERN'S Useful Metals and their Alloys. 1 vol. cloth..... 5 50

SIMONIN, L.—Underground Life; or, Mines and Miners. Edited by H. W. Barstow, F R. S. 160 wood engravings, 20 maps (colored), and 10 plates of metals and minerals in chromo-lithography..... 18 00

SIMONIN, L.—Underground Life, or Mines Miners..... 18 00

URE'S Dictionary of Arts, Manufactures, and Mines. 2,300 Engravings. From last London edition. 3 vols. 8vo. cloth. New York..... 16 50

WHEELER & RANDALL'S Quartz Operator's Handbook. Flexible cloth. 12mo. San Francisco 1865..... 1 00

WHITNEY.—A Geological Survey of California. Report of Field Work from 1860 to 1864. By J. D. Whitney. Per. vol quarto..... 6 00

YALE'S Mining Claims and Water Rights. 8vo..... 7 50

Any of the above Books will be furnished by return mail or express, on receipt of the price with postage added. Any other books desired will also be furnisbed at the lowest San Francisco retail prices. Address,

DEWEY & Co.,
Mining and Scientific Press Office, San Francisco.

MINING AND SCIENTIFIC PRESS.—This useful and scientific journal has entered upon its eighteenth volume. To the scientific, mechauic, and practical men of all classes it is almost invaluable; and we are glad to learn that it is increasing in patronage every day.

The publishers, Dewey & Co., Sau Francisco, say the present volume shall be superior in all respects to its predecessors.

The terms are $5 in advance, $3 for six months.—*San Bernardino Guardian, March 6th.*

New Mining Advertisements.

French Silver Mining Company.—Location of Works: White Pine District, (formorly Lander County), State of Nevada.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the fourth day of May, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. certificate.	No. Shares.	Amount.

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Monatain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of May 1869, an assessment of one dollar and fifty cents ($1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, Pioneer Hall, (up stairs) Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain napaid on the twenty-sixth day of June, 1869, shall be dcemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the fourteenth day of July, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. CROWNINSHIELD, Secretary.

Office, Pioneer Hall, Montgomery street, up stairs, San Francisco. my22

North Star Gold Mining Company---Location of Works: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of June, 1869, an assessment (No. 1) of twenty dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 10 second floor of No. 402 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Friday, the ninth day of July, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold Friday, the thirtieth (30th) day of July, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. W. COLBURN, Secretary.

Office, room No. 10 second floor of No. 402 Montgomery street, San Francisco. jun6

Nuestra Senora de Guadelupe Silver Mining Company.—Location of Works: Tayolilla, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of May, 1869, an assessment of two dollars per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, No. 210 Post street, or to the Treasurer, A. Himmelmann, No. 67 Washington street, San Francisco, **to settle the indebtedness of the said Company.**

Any stock upon which said assessment shall remain unpaid on the sixteenth day of June, 1869, shall be deemed delinquent, when **the payment will be enforced by law.** By order of the Board of Trustees.

E. J. PFEIFFER, Secretary

Office, No. 210 Poststreet, San Francisco, Cal. my15

Siempre Viva Silver Mining Company, District of Zarigossa, Sinaloa, Mexico.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the fifteenth day of April, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Bacon, J S	91	25	$25 00
Lohse, E S	237	2	2 00
Lohse, J F	165	10	10 00
Lohse, J F	193	4	4 00
Lohse, J F	242	10	10 00
Simon, B	98	10	10 00
Meeiz, Theo	99	10	10 00

And in accordance with law, and an order of the Board of Trustees, made on the fifteenth day of April, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by J Middleton & Son, at their salesroom, 310 Montgomery street, San Francisco, on Monday, the fourteenth day of June, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOHN F. LOHSE, Secretary.

Office, 318 California street, San Fraacisco. my29

Silver Sprout Mining Company.—Location of Works and Mines: Kearsarge District, Inyo county, Cal.

NOTICE.—The Annual Meeting of the Stockholders of the Silver Sproul Mining Company will be held at the office of the Company, No. 408 California street, San Francisco, on TUESOAY, the twenty-ninth day of June, 1869, at 12 o'clock M., for the cleclion of Trustees to serve for the ensuing year, and for the transaction of other business.

T. B. WINGARD, Secretary.

San Francisco, June 4, 1869. je5

Quarterly and Monthly Editions.

At the end of each quarter a large number of our weekly issues for the preceding three months are bound up in book form, which, by special arrangement, are placed upon the ferry boats and various steamers leaving San Francisco and other ports on the Pacific Coast, for free reading by the intelligent traveling public. The Quarterlies are also to be found in the principal libraries, depots, hotels, and free reading rooms of the Coast.

This, in addition to our Monthly Series and large weekly circulation, makes the PRESS the BEST and CHEAPEST general advertising medium throughout the Pacific Coast. The value of advertising in our columns, however, is best determined by those who have tried it, and we respectfully refer to our patrons in that line. No paper in the United States can boast a better class, and no weekly paper on the Pacific Coast receives as large a sum for regular advertising, or has more constant or long-continued customers.

A Long Desired Article

FOR CLEANING THE HEAD AND HAIR, THE CLEANing of the head and hair has been the subject of consideration for a long time. This object will be accomplished by using

CAMILLE CHAMPOO,

which not only does away with the poor soap so offensive to use, and so injurious to the hair, but it cleans the head, strengthens and beautifies the hair, preserves the color, and prevents baldness. It is cooling in nature, and can be used with safety and reliance on the smallest infant. Price 50 cents per bottle. Prepared by EMERTON & LUELLING, 273 Montgomery street, San Francisco, Cal.

HEATHFIELD & BOGLE, Wholesale Druggists, 206 and 208 Battery street, San Francisco, sole Agents for the Pacific Coast. 24v18-3m

To Quartz Mining Companies.

To be sold positively within the next three months—the MINES, ENGINE, MILL, and entire Machinery of the TEMPLAR No. 2 Quartz Mining Company, located at Indiana Ranch, Yuba County, consisting of—

One Steam Engine, 60-horse power, made by Burden, Brooklyn, New York.

Two Large Boilers, in complete order.

One Eight-stamp Battery.

One Chile Mill.

One Cornish Lift-Pump, 6 inches, of superior make and finish.

280 feet of 5-inch Iron Suction Pipe.

One large Water Tank.

And also all of the necessary machinery, with Belting, Feed Pumps, Hose, Turn Tables, Cars, Ropes, Track Iron, Flumes, Plates, with Blacksmith Shop and all Tools and requisite implements to be found in a large and first class quartz mill.

The Company having ceased operations intend selling off their effects as speedily as possible.

For Particulars as to price, etc., address, by letter or otherwise, L. W. CAMPER, at Indiana Ranch; GEORGE B. HORNISH, Marysville; or E. W. HASKELL, Pacific Fruit Market, San Francisco. 24v18-1m

This will resist the extremes of heat and cold without liquefying or hardening.

It is therefore peculiarly adapted to the varied climate of this coast, especially localities where THE WEATHER BECOMES EXCESSIVELY HOT, causing oil and all other kinds of grease to run from the axle, retaining the proper position. It remains soft until exhausted, leaving no deposit of GUM TAR OR PITCH. Its superior lubricating properties, durability and cheapness have been tried and approved by the CENTRAL PACIFIC AND OTHER RAILROADS, STAGE PROPRIETORS, STABLE KEEPERS, TEAMSTERS, CONTRACTORS, MILLMEN, FARMERS, and many others who prefer to

USE NONE BUT THE BEST.

Being prepared by a peculiar CHEMICAL COMBINATION OF OIL, previously freed from gum or other deleterious substances, it must be obvious that by its use friction will be reduced to the lowest point. We feel assured that all desiring A NO. 1 LUBRICATOR will give this the preference over any other Grease IN THE MARKET.

Sold by the Trade generally, and at the Factory, 109 Commercial street, San Francisco. **PETTIT & CO.**

will receive proposals until the first day of July, 1869, for boring an ARTESIAN WELL on the Fair Grounds belonging to the Society, 1½ miles from Salem. All communications and proposals to be addressed to

J. H. MOORES,
Salem, Oregon.

23v18-2w

Notice To Mining Companies.

The undersigned offers his services to the mining public. Having devoted several years to the study of mining and metallurgy in some of the best schools and works of Europe, and being acquainted with the metallurgical treatment of ores as practiced on this coast, he is confident of his ability to render valuable aid to parties employing him.

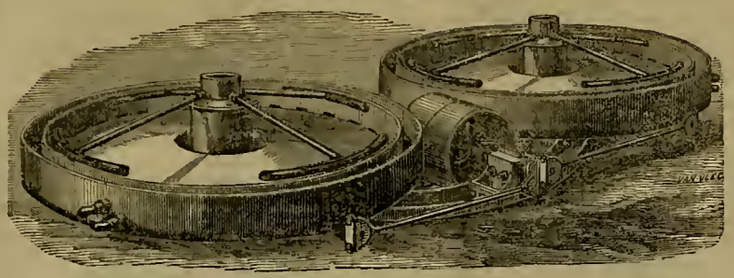
CHAS. C KUEGER.

Address, care of Mining and Scientific Press. 23v18

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low 10v17tf

HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.



There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

RECOMMENDATIONS:

SAN FRANCISCO, October 19th, 1868.

MR. M. HUNGERFORD—*Dear Sir:*—We have had twelve of your Concentrators at work at the Oneida Mine, Amador County, for about six months. They give entire satisfaction. They are strong and substantial, requiring, thus far, no repairs, and do their work thoroughly and effectively. At a recent clean-up of four of them, I found that in four weeks' time we saved about $500 in free gold, besides the sulphurets, or not far from one dollar per ton on the entire crushing of the ten stamps connected with them. In my opinion, it is for the interest of every quartz mill to have your machines. Yours, respectfully, GEORGE PRINGLE, Supt. Oneida Mine.

OFFICE OF THE ONEIDA MINING COMPANY, Jackson, May 13th 1868.

MR. MORGAN HUNGERFORD—*Dear Sir:*—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any others I have used. I have ordered Messrs. Goss & Lumbard to make eight more for me as soon as possible. Very truly yours, JAMES MORGAN.

BIG OAK FLAT, May 25th, 1868.—*Mr. T. W. Mulford*—DearSir:—I have used two of M. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

The Hungerford Concentrator has only to be seen to be appreciated. No millman will use any other kind after he has tried that. They are in active operation in mills throughout the State, and give perfect satisfaction.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

In future these Pans will be manufactured by GODDARD & Co., at the Pacific Iron Works, San Francisco, which is a guarantee that they will be built in the most substantial manner.

These Pans may be seen at the Pacific Iron Works, First street, near Howard, San Francisco.

Address,

GODDARD & CO., San Francisco.

Or M. HUNGERFORD, at the Pacific Iron Works.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.,

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. Branch Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. A. ECKFELDT,

Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco, 12th March, 1869—Messrs. A. S Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,

Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the **10th, 17th** and **30th** of each month that has **30** days.

On the **10th, 18th** and **30th** of each month that has **31** days.

When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding; when the 17th falls on Sunday, they will leave on the Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departure of the 17th or 18th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

The following Steamships will be dispatched on dates as given below:

June 1—GOLDEN CITY.....Capt Wm. F. Lapidge,
Connecting with ARIZONA, Capt. Maury.

June 9—MONTANA.....Capt E. S. Farnsworth,
Connecting with ALASKA, Capt. Gray.

June 18—COLORADO.....Capt. Wm. H. Parker,
Connecting with HENRY CHAUNCEY, Capt. Connor.

June 30—CONSTITUTION.....Capt. Wm. H. Hudson,
Connecting with ARIZONA, Capt. Maury.

Passengers berthed through. Baggage checked through. One hundred pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets to Liverpool by the "Inman" and "National" Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight to New York and Way Ports, Company's Form of Bill Lading only used.

No Freight will be received on board after 2 P. M. of the day prior to the steamer's departure.

The Steamship CHINA, Capt. Warsow, will be dispatched for YOKOHAMA and HONGKONG on FR DAY, June 4th, 1869, at noon connecting at YOKOHAMA with the steamer NEW YORK for SHANGHAI.

For passage, freight and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.

Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

J. M. BUFFINGTON,

A NEW

Gold Metal.

THE GOLD METAL WATCHES

Now being introduced by

C. E. COLLINS & CO.,

No. 629 Washington street,

SAN FRANCISCO,

Surpass anything yet made in the way of an Imitation Gold Watch. They wear well, and keep good time.

The Ladies' Watches cost $8 and $10 each. The Gentlemen's cost $15 and $20 each. Chains, from $3 to $6 each.

RECOMMENDATIONS:

SAN FRANCISCO, May 12, 1869.

This to certify, that I have carried one of the small size Gold Metal Watches which I got of C. E. Collins & Co., and I find that it runs as well, and keeps as good time, as any Watch I ever carried, and I can therefore recommend them. I am engaged on the Sacramento steamer "Chrysopolis." C. A. COLBY.

I am an engineer on the San Jose Railroad. I have been carrying one of C. E. Collins & Co's Watches for about one year, and I can safely say it is the *very best* watch for time that I have ever seen. GEO. CORNWALL,
Engineer on the San Jose Railroad.

MESSRS. C. E. COLLINS & CO:—Having heard your watches spoken of in the highest manner, I have resolved to order one for myself. You may send me one of the Lady's $10 Watches, without the chain. Send it as soon as possible, as I am very much in need of a time-piece.

R. B. PATTEN,
Toano, C. P. R. R.

The Public are cautioned against buying their watches at high prices, as many of them are sold for genuine *Gold Watches*, at from $100 to $150 each.

For List of Prices and Description of Goods send directly to us. Can be sent by Express, to be paid for on delivery.

C. E COLLINS & CO.,

No 629 Washington street, San Francisco.

P. S.—Where six Watches of the above are ordered at one time, we will send one extra, free of all charge.

We also deal in the finest Gold and Silver Watches Watch Materials, etc. Send for circulars or prices.

RANSOME'S PATENT

Diamond Grit Grindstones,

Warranted of Uniform Texture,

TWICE AS STRONG AND WILL CUT AT LEAST TEN TIMES AS FAST AS THE BEST NATURAL STONES.

We manufacture the following qualities, viz:

"Hard," for Machinists, etc.

"Medium," for General Use.

"Soft," for Wood Workers, Etc.,

Diameters, 4 to 70 inches; thickness, ¼ inch to 12 inches; and any fineness required.

Solid Emery Wheels and Sharpening Stones,

Of all forms and materials.

These Stones are fast superseding the natural ones in England, the tests made there showing them to cut about fifty (50) times as fast as the Newcastle, and entirely free from flaws, and hard and soft spots.

☞Grindstones, with Frames, Iron Troughs, Shafts and Treadles, ready to set up in working order, for sale a wholesale or retail.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

Mining Property for Sale.

A Two Thirds Interest

OF THE

Golden Rule Mining Company's
Claims and Mill,

Situated in Tuolumne County, California, two and a half miles south of Jamestown, on the Great Mother Quartz Lode. A good 15-stamp Water Power Quartz Mill is situated on the property, with a never-failing supply of water, as can be shown by the last four years continual running. This Claim has three parallel Ledges, from 50 to 100 feet apart, averaging from two to six feet in width, with a length of six hundred feet. They are so situated that a tunnel has been run through them at right angles, making a surface drainage of from seventy to eighty feet in depth on the mine. The mine is well ventilated by shafts from the surface, and well timbered so far as worked. In the mine are steam Hoisting Works, capable of hoisting from a depth of 300 feet. A force of thirteen men only are required to keep both mill and mine running regularly.

On the surface and flats for a distance of 500 feet from these veins, the ground or surface was mined by placer miners, in former years, producing from two to five ounces per day to the man, during the season when water could be obtained, which factgoes to prove that a heavy deposit of ore was once contained in the croppings of these shutes, which, by all former and present theories of deep mine workings, came from below, indicating that when sunk upon to a proper depth, the lead will develop a mine equal to the Amador or Eureka.

This claim has paid its 19th regular dividend of $1,500 each, during the past four years, besides all the construction and other expense account, and has levied no assessments during the same time, and at present has on hand $8,000 in the Treasury, and no debts.

The last level, 150 feet from the surface rock, averaged $7 per ton, on which was a profit of from $1 to $1 50 per ton. The length of the two shutes of ore on the east vein, and the only one worked upon, has been about 200 feet.

Now I propose to sell two-thirds of this valuable property for $16,000, cash; and any party who desires to purchase a property of this kind—which theory has proven that it requires depth, on well known shutes of ore, for a sure fortune—could obtain a chance here, providing he or they will go down a sufficient depth. No purchaser is solicited unless he first goes and examine the mine, or sends a mining engineer in whom he can have confidence, to indorse what he may think proper of what has been here stated.

For any further particulars, direct by letter to Wm. Sosworth, San Francisco, P. O. Sox 1978, or at my office, room No. 5, over Donohoe & Kelly's Sank.

Written for the Mining and Scientific Press.

Eating.

EDITORS PRESS:—Eating is a pleasant exercise to one in health. But wherein consists the chief pleasure? Let us step into a restaurant and observe the process awhile, and see if we can make an analysis of its pleasures.

There is one chewing away on a tough piece, as though he enjoyed the *chewing*. Without doubt there is great pleasure in this part of the process. We love to chew for the sake of this pleasure, even when no other is connected with the exercise. We all loved to chew gum or the gluten of wheat. Some will chew even the piece of an old shoe, if made of india-rubber. Others again will chew tobacco. Chewing may be cultivated till it becomes a habit. Then the subject is uneasy, unless he has all the time something between his teeth. We prefer to chew that which has a decided flavor, whether that of itself be pleasant or not, rather than chew a tasteless thing. Some can chew contentedly on dry toast or a cracker; but few, if any, love to chew long on the same piece of beef-steak. The picture of perfect content shown by the cow or the sheep, while ruminating, illustrates the great pleasure in chewing.

Yonder is another, who takes his food in little mouthfuls, and seems to spread that little all over the inside of his mouth; and he gently, very gently smacks his lips now and then, and his countenance lightens up as he put some more savory morsel upon his tongue. He seems to enjoy the tasting more than the mechanical process of chewing. He loves those dishes that are so prepared as to need but little chewing; yet he eats slowly, as though he would bring every particle of food in contact with some part of the gustatory nerve, and thus extract all possible pleasure from its rare flavor. He does not holt his food like the dog, as though it were a disagreeable pill that ought to be sugar coated and swallowed at the earliest possible moment. Tasting is his chief pleasure.

But over there is another who seems to place the hight of enjoyment in the swallowing. Just notice how he shovels it in! And how quick all is disposed of! He eats like a serpent. Swallowing is the principal thing with him. Then he is sure of it; like that man who laid a wager he could swallow three dozen hard-boiled eggs within so many minutes. Swallow them whole! As though there was manhood in acting like a constrictor or a shark.

Again, there is a negative pleasure from eating—a relief of hunger. We feel better after we get over hunger, and we would eat, were it an unpleasant exercise, just for the relief it affords.

But there is a man who is never satisfied with *quality;* he must have *quantity* till he feels a sense of fullness. He scarcely ever knows what hunger is. He eats early and often, and stimulates his appetite with condiments. Eating is continued till he is *full,* whatever may be the nature of the dish. Such are gluttons, and if not drunkards also, it is because under great moral restraint, or because they are too stingy to buy their own whisky. Their only rule is *fullness,* whether they take solid or fluid. When the sense of fullness subsides they are ready for another drink. Of all the pleasures of eating or drinking, that arising from fullness is the meanest and most brutal. It can not be followed without debasing the whole nature, clogging the mind and destroying the body.

Savage nations have very little idea of savor or flavor in their food. If it is not decidedly repulsive and relieves hunger, they are satisfied. But as refinement comes in, neatness and skill in preparing food gradually develops a keener appreciation of flowers, until at length we perceive a harmony existing between certain dishes, and one course follows another, as strains in a tune, in such a manner as to develop the greatest amount of rational enjoyment from the skillful arrangement of their amount and succession.

We are inclined to place the most rational pleasure of eating in the tasting. But if we place the highest pleasure here, we should so use it as not to destroy its

power. A wise use will preserve it to a good old age.

Eat not to fullness, for that is a low, swinish kind of enjoyment. Bolt not your food, for then you lose much of the pleasure it was designed to give. The person who eats wisely will *taste* more while eating an ounce, than some men and animals do while eating a pound. I once knew a man who was very fond of oysters. He would give a good price for a choice lot; have them prepared with great skill in his favorite style; invite his friends to enjoy the treat with him, but a saucerful was all he would take at a sitting. They were delicious, and *he* enjoyed them best of anybody; and he expected to enjoy the like some other time. In my estimation he was the noble eater, the rational and refined eater, a true gentleman. JEIGH ARRH.

A NATURAL PIGMENT.—A new pigment has been discovered in some lead mines in New Jersey, which consists of an intimate natural mixture of zinc and lead, and is termed plumbate of zinc. A certificate of its qualities has been obtained from the School of Mines, Columbia College. It is stated to possess the following peculiarities: It covers better than pure oxide of zinc, or the best white lead; it covers more surface, weight for weight; it makes a harder and more durable coating; it will wear longer when exposed to the weather; and it resists for a greater length of time the action of sulphureted hydrogen, and other deleterious gases, which so quickly discolor white lead. At the same time its cost is considerably less.—*Iron Age.*

NOTHING LIKE ENGLISH.—It is said that there is no other spoken language so cheap and expressive by telegraph as the English. So the electric wires are becoming teachers of our mother tongue in foreign countries. The same amount of information can be transmitted in fewer English words than French, German, Italian, or any other European language. In Germany and Holland especially, it is coming to be a common thing to see telegrams in English, to save expense and insure precision.—*N. Y. Stockholder.*

GEO. E. ROGERS,

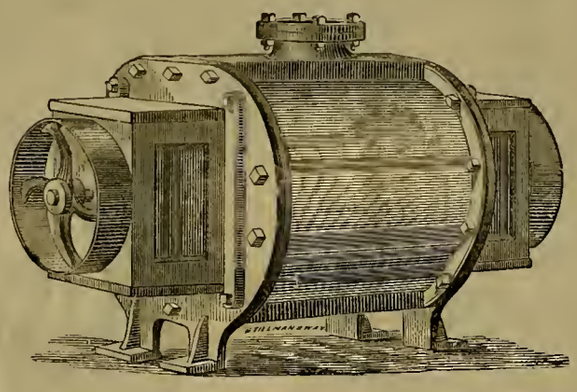
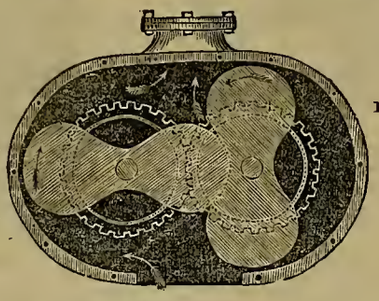
LEA & PERRINS'
CELEBRATED
WORCESTERSHIRE SAUCE
Declared by connoisseurs to be the only
GOOD SAUCE.
The success of this most delicious and unrivalled condiment having caused certain dealers to apply the name of "Worcestershire Sauce to their own inferior compounds, the public is hereby informed that the only way to secure the genuine, is to ask for
Lea & Perrins' Sauce,
and see that their names are upon the wrapper, labels, stopper, and bottle.
So one of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L and P give notice that they have furnished their correspondents with power of attorney to take instant proceedings against Manufacturers and Vendors of such, or any other imitations by which their right may be infringed.
Caution against Fraud.
Ask for LEA & PERRINS' Sauce, and see name on the Wrapper, Label, Bottle, and Stopper.
Wholesale and for Export by the Proprietors, Worcester; Crosse & Blackwell, London, etc., etc.; and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 3v18-6m

$500 WANTED—TWENTY MEN WITH $500 EACH—must be men of the right stripe—to join an expedition that is organized in this city.
FOR SALE.—Patent Dovetailing Machines, that do the work of 40 men—the greatest invention on this coast. For particulars apply to J. S. MAXWELL, 413 Kearny street, Room No. 1. 22v13-1m

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.
Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.
Awarded the First Premium at the Paris Exposition.



ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may he seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address

KEEP & BARGION,
Globe Iron Works, Stockton, Cal.

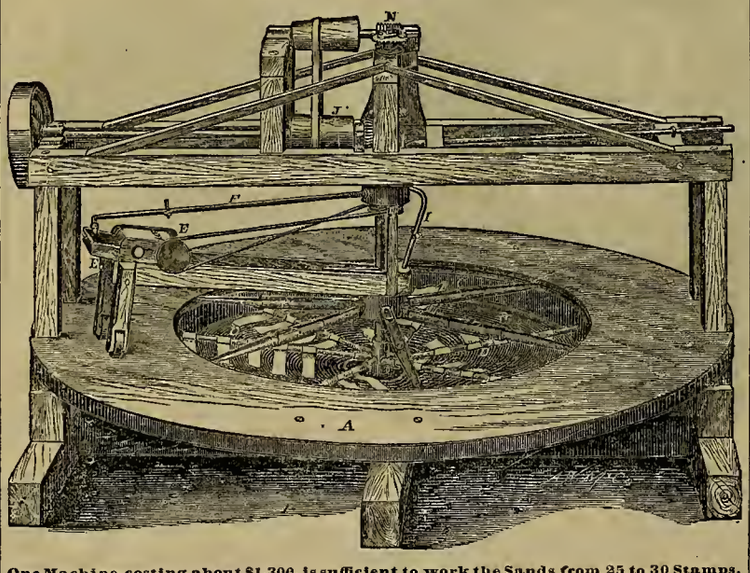
PAINE & STEPHENS'
IMPROVED CONCENTRATOR,
For Saving Gold and Silver Sulphurets.



One Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps,

Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Bauer Co's mill near Nevada, and see for themselves.

CERTIFCATES:

GRASS VALLEY, Jan. 4th, 1869.—This is to certify, that we have used the Paine, Stephens & Harry Concentrators for over twelve months. They have given us entire satisfaction, and are the best we ever used. WILLIAM WATT, Supt. Eureka Mine.

This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphuret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets.
WM. L. TISDALE, Supt. Star Spangled Banner Mine.

NEVADA CITY, Oct. 26, 1868.

Any one wishing to purchase one of these useful machines, can do so by applying to THOS. N. PAINE, at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.

10v18-6m B. F. HOWLAND.

DR. HALL has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs. Curling, Druit, Lee, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Boech, Sperino, and Dewilz. Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to newcomers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco. 2Iv18-3m

Pain Killer.—We beg leave to call the attention of the public to this long celebrated and unrivalled Family Medicine. The Pain Killer is a purely vegetable compound, and while it is a most efficient remedy for pain, it is a perfectly safe medicine even in the most unskillful hands. For Summer Complaint, or any other form of bowel disease in children or adults, it is an almost certain cure and has without doubt been more successful in curing the various kinds of Cholera than any other known remedy, or even the most skillful physician. In India, Africa and China, where this dreadful disease is even more or less prevalent, the Pain Killer is considered by the natives, as well as European residents in those climates, a sure remedy.

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

REDINGTON & CO., and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents. jelm

PATENT AGENCY

DEWEY & CO.

PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS. Principal Agents west of the Mississippi—Established 1850. Our appointments are substantial, reliable and complete, for securing patents in the U. Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1885, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

Barlow's Double-Shanked Anchor.

A special trial of this anchor was recently made at Mare Island Navy Yard, by order of the Commandant, the official report of which, under date of May 27th, 1869, having been placed in our hands, we copy as follows: "The anchor weighs 270 pounds; it has no stock, has a double shank, working on a pivot at the ring and at the crown. Both flukes take the ground at the same time, so that it cannot foul the chain. The test was made by the steam tug Monterey dropping the anchor in between five and six fathoms of water, veering to fifteen fathoms chain, then backing the engine strong, which caused it to drag slowly, but on stopping the engine the anchor held.

We are of the opinion that the anchor deserves favorable consideration—that it has the advantage of not fouling the chain, and will hold better than any ordinary anchor of equal weight."

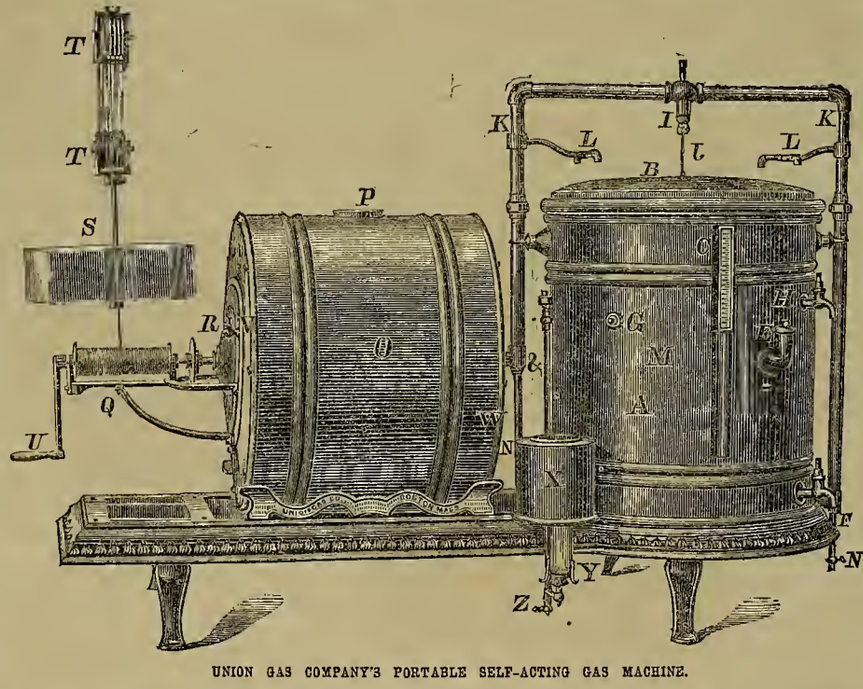
This anchor,—the invention of Mr. E. T. Barlow, of this city,—will be recollected as the one which attracted considerable attention while on exhibition last summer at the Mechanics' Institute Fair, and at the Merchants' Exchange. A caveat having been filed for this invention some months since, application for Letters Patent for the same have been sent to Washington, the past week, through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

THE OPENING OF THE NEW STOCK BOARD took place formally on Monday last, in the elegant hall at the corner of Montgomery and Washington streets. Mr. W. H. V. Cronise the Vice President's address was an interesting, clear-minded, crisply-worded little speech, that did all that could be desired to launch the undertaking favorably before the public. "A Stock Exchange," said Mr. Cronise, "is the congregation of various wares under one roof (for stocks are wares). Even the necessities of domestic life demand that household supplies should be found in one market. The only difference is that the broker is a middleman, and agent for both buyer and seller. His duty lies between them, and herein lies his responsibility."

Home Gas Manufacturing—Light and Power.

A few facts on this subject will be of interest, scientifically, as well as of importance to all consumers of light-producing agents, from an economical point of view. One of the latest, and the simplest, of home gas manufacturing machines yet invented, is illustrated in the accompanying cut, representing the Union Gas Machine, which may be seen in use at Mr. James Atkinson's saloon, No. 538 Market street. In regard to the principles employed, the inventor's own language cannot be improved upon:

The action of the Union Gas Machine is as complicated as the following experiment—no more so. Take a common bowl. Pour



UNION GAS COMPANY'S PORTABLE SELF-ACTING GAS MACHINE.

in some light naphtha (distilled or light petroleum). Put the end of a pipe-stem into the fluid. Cover the first bowl by a second one inverted—putting the two bowls rim to rim. Blow through the pipe-stem as if you were to make soap-bubbles. The operation is finished the moment the upper bowl is filled. Gas is made. Prevent the escape of the gas between the rims; make an orifice in the upper bowl, and from it you can obtain a good gas-light. The air passes through the naphtha, becomes impregnated with its vapor, rises to the surface, and is there caught and held in the upper bowl, ready for use.

A is the generator—the lower bowl. B is the cover or holder, with a rim of water to prevent escape of gas—the upper bowl. O is the air pump—the lungs. S is the weight to propel the air pump—the muscular power. The weight S begins to fall, and by means of the wire-rope, pulleys and drum, revolves the pump inside of O, which then forces air through its center up one pipe K, through the valve I, down the other pipe K under the generator, and up through the fluid by means of a float. It is then gas. The floating cover B holds it, and as more gas is made it rises up until the pressure of the gas under this holder or cover balances the power that forces in the air, whereupon the weight ceases to fall and the pump to move. As soon as a burner is lighted, gas is consumed, and the pressure diminishes in the holder B. Of course the weight is then greater than the pressure, and therefore begins to fall, which in turn induces the air-pump to move, and fill up the vacuum, or rather attempt to restore the equilibrium. The more gas that is used the faster the pump moves and the more the weight falls.

What practical drawbacks might be discovered, we know not; but Mr. Atkinson informs us that there are none whatever; that the machine works to a charm, requiring only a daily winding up,—a care of about three minutes. He has used it for eight months to supply fifteen burners, one of which is used both night and day, and he calculates his saving on gas bills within that time at $396. The price of city gas is at present $5.75 per thousand feet; that of the Union Machine, according to our informant, is $1.75 per thousand feet. He pays for naphtha 33⅓ cents per gallon, and uses about a gallon in twenty-four hours. Just now there is little naphtha in the market; but it is produced in more than the necessary quantities as a regular distillation product of petroleum. Another of these machines may be seen in operation at the shop of D. Simpson & Co., plumbers and gas-fitters, No. 117 Sutter street, who are the agents for the Pacific Coast, and who sell a 40-light machine at $450, one of 60 lights for $500, 100 lights for $700, and 200 lights for $850.

Home gas machines, that will run and regulate themselves, at such a reduction even on the price of petroleum light; using oil that is bored from the rocks of the earth many hundred feet beneath the surface, whence it flows like a spring out of a reservoir of nature's distillation from the vegetable matter of ages past; and then to convert all this into power, with the *gas engine* of Lenoir, described and illustrated in these pages a few weeks ago, that likewise takes care of itself, runs at little cost, and without steam, or boiler, or preparatory firing up: what a comment upon the efficiency of invention in our day! Light and power, *ad libitum*, at everybody's command. Let us make a note of it—this is what we have come to.

A NEW ANTIMONIAL LEAD AND SILVER COMBINATION.—From the vicinity of Oreana, Humboldt County, there has fallen into our hands, through Mr. G. Kustel, a specimen of an ore commonly recognized in that neighborhood as carbonate of lead, but which does not contain any carbonic acid whatever. It is, apparently, a combination of antimoniate and arseniate of lead, containing some silver in a metallic state, with a considerable percentage of water. It has somewhat the appearance of a smelting product, but its percentage of water is decisive against that supposition. It is homogeneous, semi-translucent, of amber color and of the same cloudy appearance, in parts also like sulphur in color; hardness 4 (of fluor-spar); smelts only at a white heat, but on reaching that point the mineral fluxes beautifully; gives before the blowpipe a garlic odor, the white sublimate of antimony, and a lead button. This ore is one of the peculiarities of the Humboldt region, which is remarkable for the variety, oddity and complexity of its ores of silver, lead, and copper, including gold.

CEMENT.—A contract has been made for the delivery in this city of 20,000 barrels of Rosedale cement for the construction of the new mint building, on Fifth street. It will cost the government $3.93 per barrel (currency) landed here. The only bid from this city was at $6.50 per barrel. It is to be regretted the new mint building could not have been put up with California cement, than which no better is made anywhere. We should suppose that so large an order might have been filled at a lower rate than that named for San Francisco; although the successful bid is much below the market price, and will probably leave but little if any margin for profit. A strong Eastern opposition is always brought to bear against any industry here which promises to seriously interfere with any large importation from the Atlantic States.

Silk Culture in California.

Our people appear, at last, to he in earnest with regard to tbe establishment of silk cultnre in this State. The more inquiry is made among tbose who bave bad experience in the matter, the stronger the impression grows that the business is destined to become one of overshadowing importance.

The peculiar applicability of our climate to this cnlture is attracting to our shores silk growers from all parts of the world. In addition to Mr. Prevost, tbe well-known pioneer grower, and Mr. Newman, the pioneer manufacturer, we bave also a great nnmber of otbers experienced in the business, from Italy, France. Japan and China, the four great silk-growing districts of the world. All of these persons are unanimous, after careful inspection, in the opinion that the advantages of this State for the successful prosecutiou of the business have not been overrated. The peculiarly favorable conditions of our climate, and our nearness to the silk-producing regions and cheap labor of Eastern Asia, places us at least on an equality with the cheapest and best skilled labor of Europe.

What are we Doing.

Three years ago there were only about 4,000,000 mulberry trees iu tbe State; now the number cannot he less than 20,000,000. This is a very good stock of trees to begin business witb, and there is every probability that it will be fully improved.

With regard to the present year's prodnction of cocoons, the probability is that the number will certainly reach 75,000,000, and most probably 100,000,000, or more. One million of cocoons will weigh about one ton. Extensive preparations bave been made for the permanent introduction of the bnsiness in the vicinity of Los Angeles. Mr. Prevost has removed thither, and associated himself with Mr. Gary, of that city, where they have erected the largest cocoonery in the State, and expect to produce at least 3,000,000 cocoons this year, which will make 6,000 pounds of reeled silk.

Mr. Albert Brewster, at tbe San Gabriel Mission, nine miles above Los Angeles, is feeding 6,000 worms, and expects to feed over 3,000,000 during the season.

Mr. D. F. Hall, near by, is feeding 500,000. We are not informed of the nltimate number he proposes to feed the present season; but presume it will reach several millions.

A firm at the same place, name notgiven, has gone very extensively into the business; having hired forty Chinese families to carry it on. Each family is provided witb a house and garden. Their engagement lasts for four years; at the expiration of which time, each one who chooses to continue with him will be entitled to a deed of ownership to his house and garden.

Tileston & Emery, same place, offer as a free gift, to any skilled Japanese, 2,000 acres of good laud, provided they will enter upon and establisb there permanent silk culture.

Nevada County has also entered extensively into the business, and will produce a large amount of eocoons the present year, more or less of which, we believe, it is their intention to reel. The experiments of Messrs. Muller and Isoard, of Nevada, have been highly satisfactory. Attention in that connty is now being very generally turned in this direction, and efforts are being made to induce some of the Japanese, now in the State or to arrive, to locate there and establish a factory as well as plantations.

Mr. Louis Reiher has started tbe bnsiness on his place about six miles east of Placerville, and will raise at least 100,000 cocoons tbe present season, so as to come in for the State bounty.

A company is engaged on a very large acale, near Davisville, in Yolo County, which intends to make the culture of silk a permanent business.

We are not informed in regard to tbe number of worms whicb will be fed the present season hy Messrs. Hoag & Haynie, of Sacramento; but judging from their extensive arrangements, and from what they did last year, the number will be immense. These gentlemen are well knowu as tbe largest silkworm growers in the State.

In addition to the parties already mentioned, there aro great numbers of others engaged iu the business in all parts of the State, the aggregate of whose productions, will be very large.

Japanese and other Adventurers.

Perhaps the most promisiug aud important incident connected witb this husiuess, the present season, is the arrival among us of Herr Schnell, a Parisian gentleman, by birth, but for the last twelve years a resident and prominent official in Japan. Tbis gentleman has brought with bim several Japanese, skilled in the cultivatiou of both silk and tea, who are tbe precursors of forty families now on their way thither, and some eighty more, who will soon leave Japan with the view of making tbis State their permanent home, and to engage here in the culture of silk and tea. Many of the individuals connected witb this company have been men of prominence at home, who have been forced to leave their country on account of political disturbances. They are educated and intelligent, and thoroughly understand the business in which they propose to embark. They have already selected one location of 2,000 acres—the ranch of Charles Grainor, near Placerville, for which they pay $5,000. They will probably make additional locations in other portions of the State. We understand they prefer the central to the southern counties, and the foot-hills to the valleys, for reasons which we will endeavor to give at length hereafter. They have brought with tbem 50,000 trees of the *Alba* or wbite variety, which is preferred in Japan to any other.

In this connection we would also meution tbe recent arrival of Mr. Lewis D. Combe, a native of Piedmont, iu Northern Italy, where he was for mauy years engaged in tbe growing and manufactnre of silk. Mr. C. has resided several years in St. Louis, wbere he has become familiar with our language. He has been attracted to this State hy the fame of its superior fitness for silk growing, and proposes to associate himself witb capitalists for the purpose of going extensively into the business to which he become strougly attached in bis early life.

The Mannfacture of Silk.

The efforts of Newman, the pioneer silk manufacturer in this State, have uot yet met with any marked success, for several reasons. First—At the time of his attempt to introduce such manufacture in San José, the puhlic had not become sufficiently settled upon the value or feasihility of the business here, to risk capital in that direction. Perhaps, too, tbe original plan of operations was not altogether what it should have been. Hence notbing has heen attempted beyond the production of a few yards of dress goods, mainly to sbow what *can* he done. His experiments have shown conclusively that silk cau he woveu in California as well as elsewhere. Then again, for reasons hereafter given, no considerahle quantity of merchantable cocoons have yet been produced here from which goods could be made. This matter, however, will soon right itself, and manufacturing operations will be entered upon in earnest.

In the meantime Mr. Newman is engaged at his rooms, No. 422 Commercial street, in reeling a lot of California cocoons (all he has been able to purchase) upon an improved machine, of his own invention, and on which he has applied for letters patent throngh this office. A portiou of this silk will he woven into bunting for the manufacture of two national flags.

Several other projects for manufactories have been projected; and persons engaged in the raisiug of silk may look out for quite a lively competition for tbe purchase of the raw material, as soon as they are ready to put it iu the market.

We may also state in tbis connection that a gentleman from Illinois, who has been engaged in the manufactnre of silk aud woolen goods in tbat State, has written to the Mechanics' Institute of this city tbat he proposes to come bither to engage in the manufacture of silk exclusively. He has all the requisite machinery, which he will bring with him. He will start his manufacture with raw silk made in Tennessee, such as he has heretofore been using; but will purchase the same material here, as soon as it is put into the market.

Questions about the Bounties.

By a singular and unforseen circumstance the purpose of the State in offering bounties to encourage the proper inception of the silk business has been, thus far, rendered quite inoperative, so far as the actual production of silk is concerned. Since the bounties were offered, a most unexpected demand for the eggs has grown up in consequence of the appearance of the silkworm malady iu Europe. In order to obtain these eggs the cocoon must be destroyed so far as its value for reeling is concerned, and the consequence has been that notwithstauding several tons of cocoons

However unfortunate this may be for tbe encouragement of the legitimate and laudable enterprise of our friend Newman in establishing his pioneer manufactory, tbe speculation will not he without benefit in the end. Trees will be multiplied to the utmost extent, so that when we are prepared to enter in earnest into the business, there will be no lack of material. It is simply a putting off of the legitimate enterprise, sought to be encouraged, to a later time; when it will be undertaken on a larger scale and with a greatly increased capital, over that which could have been obtained at an earlier date. We have too much confidence in the enthusiasm and love of the business on the part of those most deeply engaged tberein, to believe that they will at present unnecessarily witbdraw therefrom a dollar whicb has been made from it, or which may hereafter be derived from State bounties.

The State offers a bonnty of $300 for each 100,000 "good, marketable cocoons;" and $250 for each plantation of 5,000 tons two years old or more, set out at proper distance apart for silk culture. Much difference of opinion seems to exist as to what should be considered "good merchantable cocoons"—whether those only should he counted which are in perfect condition for reeling, or whether tbe bonnty also applies to those from wbicb the worm bas been hatched, and the cocoon thereby rendered unfit for reeling, and those also in which the worm has been prematurely killed by the forcing process before the cocoon was fnlly formed, to multiply the numher of cocoous at tbe expense of quality.

Similar questions seem also to have arisen with regard to the application of tbe bounty for trees. Can the amount of $250 be claimed for each numher of 5,000 trees in a plantation; or will any one plantation numbering five times 5,000 trees be entitled to five bounties of $250 each. There also appears to be a question of doubt as to intent of the law in defining the age of trees, and the proper distance apart for silk culture.

While these matters may have little to do directly with the establishment of the silk bnsiness, they are of much importance to tbe public treasury. There will most probably be found the coming season, fully 15,000,000 trees in the State two years old, and fit for silk culture; possibly 100,000,000 eggs. By a free construction of the law the trees will draw bounties to the amount of $750,000, and the eggs $300,000, or $1,050,000 in all; while by a close construction tbis sum would probably be reduced to less than $100,000. Tbe law should be construed witb a reasonable liberality towards the silk culturists; but careful investigation sbould be made into the facts before any bounty whatever is paid. The next legislature should and probably will repeal the present law, and pass another offering reasonable bounties for the prodnction of raw, spun, and woven silks. A few thousand, or even a few hundred thousand spent in a proper encouragement of the silk business in this State would soon return to us an hundred fold.

The Silk Growers in Council.

A meeting of persons engaged in silk growing was recently held in Sacramento, having for its object a comparison of notes and interchange of statement upon all matters pertaining to the business of silk growing. The meeting, although an open one, was held uuder the auspices of the Pioneer Silk Growers' Associatiou. Most of those present, ahout twenty-five in nnmber, who were not already members of the association became such, by the payment of the small fee required. Interesting and instructive remarks were made by Capt. Blanding, Mr. Hoag and others. Among other business a committee of correspondence was instituted and instructed, in addition to tbe usual duties of such a committee to procure a uniform paper, to be stamped with the Seal of the Association, for the use of the members in saving the eggs of the worms. The object beiug to prevent imposition by traders in European countries, in counterfeiting California eggs, which has been done the past year, to a very great extent. All other associations of silk growers in this State were invited to coöperate in this last matter.

Encouraging remarks were made with regard to the present condition and future prospects of the silk business in this State. The members appeared to be in earnest in their efforts for its advancement, and willing to lay aside all selfish considerations for the general good. Several ladies were present, as silk growers, which added much interest to the occasion, and gave a practical demonstration of the fact that this was a business in whicb women and children might become active and useful coöperators.

were produced in this State last aeason, it has heen very difficult to find a sufficient quantity of merchantable ones to furnish the silk for the national flags, above alluded to, which the State desires to manufacture from native cocoons—the one to be raised over our new State Capital, the coming winter, and the other for tbe National Capitol at Washington.

Nature of the Luminiferous Ether.

Tbe following is part of a communication to the Boston *Journal of Chemistry*: "Some conteud that it consists of ordinary matter in an exceedingly rare condition; othera believe it to be characteristically different, being, for instance, void of gravitation. Of the ultimate constitution of matter, we know little or nothing. While aome contend that it consists of ultimate particles of definite size and shape, others deny the existence of *atoms* altogether. From analogy, we might fairly infer that what constitutes a cbemical atom is not an ultimate atom, even if we admit the existenco of ultimate atoms. When, from the imperfection of our senses, we are no longer ahle to trace the subdivision of matter we should not conclude tbat we have arrived at the limit of its actual subdivision; but, as we know that in the celestial space wo have suns innumerahle, each of whicb has probably a retinue of planets; and each sun, with its planets, constituting but a *molecule*, as it were, of a great stellar system,—creation thus extending tbrough *infinite* spaces,—we may tberefore fairly infer that in the desceuding scale of creation tho same condition also exists; that is, each chemical molecule is a collection of chemical atoms, each atom of which is probably a collection of innumerable sub-atoms, thua descending also to infinity.

It may be objected that we can have no conception of a universe of infinite extent, or of an infinite subdivision of matter. Tbis is true; but we know that *space* is infinitely extended, and as we find matter occupying space everywhere, we have no difficulty in admitting that where there is space there *may* he matter. Therefore creation *may*, obviously, be infinite in extent, and chemical atoms may be, and probably are, iufinitely divisible.

I infer, therefore, that the ether is matter in no respect different from ordinary matter, except that it is in a finer state of subdivisiou than our chemical atoms, but capahle perhaps of couversion into chemical atoms hy a process analogous to that by which stellar systems bave been formed from nebulous matter."

A Canadian Exodus.—The New Dominion does not seem to be in a very prosperous condition, even when excepting the "moral rebellion" in Nova Scotia. Tbe people are rapidly leaving every part of the Dominion, and manufacturing and commercial interests are suffering greatly in consequence. Things are equally as unpromising in the little patch of British territory sandwiched in between Alaska and Washington Territory. The establishment of the new government is greatly increasing taxation, without any corresponding benefit—that's what's the matter. Annexation to the United States is the ouly remedy. At the present rate of depletion, there will be scarcely anything but unpopnlated territory to annex in ten years from this time.

Forces of Nature.—According to the law of Carnot, heat can he converted into mechanical force only when it passes from a warmer to a colder body. The radiation and conduction by whicb tbis is effected, tend to induce an equilibrium of temperature, and consequently to annihilate mechanical force. The same destruction of energy is always proceeding in other natural processes. Professor Thompson has deduced from this law of Carnot, that the universe is continually tending towards a state of eternal rest, and that its store of available force must become at length exhausted, uuless replenished by a new act of Creative Power.

Spars.—A contract has heen made at Victoria for the shipment of a largo quantity of spars from British Columhia to England.

In every plaster of paris statue or ornament there is one pound of water to every pound of plaster.

Mechanical Progress.

Krupp's Establishment at Essen.

A correspondent of the *Scientific American* has recently visited these works. He says that the most extensive similar establishments in England bear about the same relation to Mr. Krupp's works that a yacht does to the Great Eastern. "It covers a continuous surface of 450 acres, 200 of which are under roof. The men employed number about 14,000. At the present time 180 steam boilers are used, evaporating 200,000 cubic feet of water into steam of four atmospheres pressure every twenty-four hours; and 12,000 gas burners consume, in the same time, 500,000 cubic feet of gas—the gas being lighted night and day. There are about twenty miles of rails traversing the works in every direction, upon which run seven locomotives and 150 wagons. Here is the largest forging steam hammer existing; the 'drop' alone weighing 100,000 pounds, and the casting for the hammer block 300,000 pounds. The foundation for this hammer is 60 feet deep, built up with timber and iron.

I was shown a 1,000-pound rifle breech-loading gun intended for coast defense service. It consisted of an inner tube, upon which were shrunk cast steel rings. The inner tube when finished weighed 20 tons, and was forged from a massive ingot of 40 tons; and the cast steel rings about 30 tons —total 50 tons. The diameter of bore was 14 inches, the total length 9 feet 2 inches, the weight of solid shot 1,212 lbs., the weight of shell 1,080 lbs., and the charge of powder from 110 to 130 lbs. It required sixteen months to manufacture this gun, working day and night. It reposes upon a steel carriage of the weight of 15 tons, and together they work upon a turn-table of 25 tons. The total weight of cannon, carriage and turn-table was 90 tons. The gun carriage slides smoothly upon the turn-table, and the necessary mechanism for working the gun is such that one or two men can easily elevate, depress, and turn the gun, and can, with the utmost certainty, follow and cover any passing vessel. The cost of this gun mounted complete is $187,000 gold."

Liquid Fuel in Iron Manufacture.—*The Engineer* has witnessed some experiments with vaporized creosote as fuel, in the bending of heavy armor plates. The furnace was heated by six jets; which entered it through small openings in the sides. Air was also admitted through the same openings. A plate 7½ feet long, 3 feet wide, and 6 inches thick, was placed in the furnace one hour after the fire was first lighted. In one hour and a half more, it was ready for bending. With coal, the furnace could not have been heated up to the proper commencing point in less than four or five hours; and for the heating, one hour per inch of thickness is usually allowed. It would therefore have taken ten hours at least, with coal, to do the work here done with creosote in two and a half hours. Another very important fact is, that there was scarcely any *scale* compared with that produced by the ordinary furnace. The journal named above says that the result of the experiments was highly satisfactory; and declares that a new era in the science of metallurgy has dawned.

The New Telegraph Wire.—The following is the mode of manufacture of Mosee Farmer's new compound telegraph wire, which is said to have already proved itself superior to anything heretofore used. We find it in the proceedings of the Polytechnic Association of the American Institute as reported by the *Artisan:* "Fine steel wire, cleaned in the usual way with acid, is coated with tin by being drawn through a molten bath of that metal. Pure copper, previously prepared in thin stripe, is lapped around the wire by machinery made for the purpose. After this the copper is cleaned with dilute muriatic acid, and the wire is again drawn through the bath of melted tin, which not only coats the copper with tin but brazes it to the steel wire or core. It was asserted that not only is the conductivity of this wire several times greater than that of ordinary telegraph wire, but that from its tinned surface it is inoxidizable, and consequently durable in the extreme."

To Ascertain Amount of Carbon in Iron.

Professor Eggertz, of the Swedish School of Mines, at Fahlun, gives a process for determining the absolute percentage of carbon chemically combined with iron, which J. Wharton translates for *Silliman's Journal*. We quote: "When steel or pig iron, containing carbon in chemical combination, is dissolved in nitric acid, a soluble brown coloring matter is formed, whose coloring power is quite intense, and the solution assumes a tint which is dark in proportion to the quantity of the chemically combined carbon. Iron and graphite (or free carbon), do not influence this coloring, for the solution of nitrate of iron is colorless, or at most, slightly greenish, unless extremely concentrated, and graphite is insoluble in nitric acid. Thus, in dissolving two pieces of different steels of the same weight in nitric acid, taking care to dilute the darker solution until the two liquids present exactly the same color it is very evident that the more highly carbureted steel will furnish the larger quantity of liquid, and that the proportion of the volumes will indicate the relative proportion of carbon in the two steels. If now the composition and contents of carbon of one of the steels is known, the absolute percentage of carbon in the other steel may be immediately deduced. Suppose that one gramme of each of two steels (a and h), have been dissolved, and that the volumes of the two solutions, brought to the same degree of coloring, bear the relation to each other a : b : : 5 : 7. Knowing that the steel (a) contains one per cent. of carbon, you at once deduce that the steel (h) contains 1.4 per cent of carbon."

Divers precautions are enjoined. The use of nitric acid containing hydrochloric acid must be avoided, because the solution of iron would have a yellow tint.

In proportion as the metal contains more carbon, more nitric acid must be used. The operation should always be conducted under the same circumstances as to heat any length of time.

Boiler Explosions—A New Cause Suggested.—In our issue of June 5th, we gave a notice of the experiments and conclusions of Mr. Tomlinson, in reference to certain phonomena of boiling liquids, condensed from *The Engineer*. That journal since publishes a letter, the essential portion of which we copy:

"Your report of Mr. Tomlinson's paper, 'On the Boiling of Fluids,' has reminded me of a hypothesis that occurred to me a year or two ago, respecting a possible cause of many boiler explosions which have hitherto remained inexplicable.

My idea is, that water or other fluids when quiescent are capable of receiving an increase of temperature, without a corresponding change of their bulk and density, to an extent which is not at all appreciated; and that the moment any motion from extraneous sources commences, the equilibrium is totally destroyed, and the fluid instantaneously attains its normal condition. The way in which this operates in a steam boiler is, that when the engine is standing, the safety valve closed, and the feed off, the water becomes highly superheated, until, on the opening of the stop valve, a disturbance is caused, when the surplus heat instantaneously transforms a large quantity of the water into vapor, at a great pressure, endangering the boiler. This would be prevented by some action, such as that described of Mr. Tomlinson's nuclei, or a provision by which a continuous escape of steam, however small, is allowed."

Big Locomotive.—The "Liverpool" was built for the London and Northwestern Railway. The cylinders were eighteen inches diameter with twenty-four inches stroke; the driving-wheels two in number, and eight feet diameter. The weight, thirty-five tons. The tender weighed twenty-one tons; thus making the total weight fifty-six tons. The boiler contained 2,290 square feet of heating surface. But it "used up" the road too fast, and was withdrawn from service.

Corundum Wheels.—W. E. Driscoll, of Bedford, Ind., writes to the *Dental Cosmos* as follows: "Presuming that many have been annoyed in getting corundum wheels to run true, or to give them an even surface when rough, each indispensable in making good joints, I offer the following suggestion: The wheel being adjusted to the lathe, revolve it very fast, holding a piece of corundum stone against the uneven or wabbling surface, and in a short time you will find the *piece* melting and uniting with the wheel, so as to make it perfectly true in all respects."

Scientific Progress.

The Rival Theories of Light.

Professor Tyndall, in a recent lecture at the Royal Institution, explained the reasons why the wave theory of light is now universally accepted, instead of the emission theory advanced by Newton, and supported by Laplace, Biot, Malus, Brewster, and other noted physicists. We quote paragraphs from the lecture as reported in *The Engineer*, giving some of the reasons: "If light consist of minute particles, they must be shot out with the same velocity by all celestial bodies. This seems exceedingly unlikely, when the different gravitating forces of such different masses are taken into account. By the attractions of such diverse masses the particles would, in all probability be pulled back with different degrees of force; and hence the light emitted by different bodies would move with different velocities. That such is not the case—that light moves with the same velocity whatever be its source—renders it probable that it does not consist of particles thus darted forth. According to the emission theory, when a light particle approaches a refractive surface obliquely, it is drawn towards the surface, as an ordinary projectile is drawn towards the earth. Like the projectile, the velocity of the particle is augmented during its deflection; it enters the refracting medium with this increased velocity, and once within the medium, the attractions before and behind the particle neutralizing each other, the increased velocity is maintained. Thus it is an unavoidable consequence of the theory of Newton that the bending of a ray of light towards the perpendicular is accompanied by an augmentation of velocity—that light in water moves more rapidly than in air, in glass more rapidly than in water, in diamond more rapidly than in glass. In short, that the higher the refractive index the greater the velocity of the light. But it has been demonstrated by the most rigid experiments that the velocity of light diminishes as the index of refraction increases. The medium which transmits light, assumed to be of extreme elasticity and of extreme tenuity,—fills all space, and surrounds the atoms of all bodies. The reflexion of ether waves obeys the law established in the case of light; the angle of incidence is demonstrably equal to the angle of reflexion. In the case of refraction the ether wave is retarded as it enters glass; consequently, the end of the wave which touches the glass first is retarded more than the other end, and this causes the wave to swing round so as to take a fresh direction. Waves of light are of different lengths, and refracting substances retard short waves more than long ones, so that a prism throws colored and not white light upon a screen. Color, in fact, is a phenomenon of wave-length, and white light is made up of a mixture of all the colors. Ether waves gradually diminish in length from the red to the violet. The length of a wave of red light is about 1·39000th of an inch, and that of a wave of violet light, about 1-57500th of an inch. By means of these data, it is calculated that the number of undulations, produced by red light, in the ether which touches the retina, is 477,000,000,—and by violet light, 699,000,000,—per second!

Formation of Graphite.—Berthelot has communicated to the Academy of Sciences a memoir upon the various modifications of carbon, which is full of new and interesting matter. We quote a paragraph from *Comptes Rendus:* "The intense heat produced by combustion in oxygen converts a small portion of gas-retort carbon into graphite. Berthelot suggests that it is in this manner that natural graphite has been formed, the amorphous carbon, being more oxidizable at a low temperature, having been gradually dissolved. This view derives some support from the presence of a trace of graphite in lamp black. Electricity also converts amorphous carbon into graphite, the carbon carried over to the negative pole being found to contain a considerable quantity of the latter, while the positive pole contained only a trace. The actual transference of the carbon is not however necessary for the formation of graphite; carbon from sugar softened by the heat from a battery of 600 pairs being found to contain graphite in large proportion. Carbon separated from hydrocarbons by the agency of heat does not contain a trace of graphite, while that which is separated by heat from the sulphide or chloride of carbon or by chlorine from boron contains a considerable quantity."

American Museum of Natural History.

New York has at last made a movement towards the establishing a Museum of Natural History. A recent act of the Legislature constituted seventeen wealthy and public-spirited business men Trustees of a corporate body to be known by the above title. The *Tribune* says: "Nearly $50,000 has already been subscribed toward this enterprise, and the Central Park Commissioners have generously offered the use of the fine hall in the Arsenal Building as a place where the collections may be deposited, and exhibited to the public until the erection of a special museum edifice. The only specimen yet received is the skeleton of a whale, seventy feet long, contributed by Peter Cooper, who has also given the museum the privilege of digging near Poughkeepsie for a mastodon, some bones of which have already been taken out. A large part of the great collection made by Professor Albert S. Bickmore, of Cambridge, during his travels through the East Indian Archipelago, has been definitely secured for this new museum, and successful negotiations are in progress for obtaining magnificent collections of shells, of butterflies, and of the birds of America and Africa, and also for securing a complete set of all the works of Linnæus, which, it is said, not even the British Museum possesses. A gentleman of much energy and ability and of wide experience as traveler and naturalist, has had special supervision of the enterprise thus far, and will doubtless be made superintendent of the museum."

Trichlormethylsulphonochlorid.—The simplest way to prepare the chlorid, with the above unpronounceable name, according to O. Loew,—who gives a paper upon the subject in *Silliman's Journal*,—is the following: "300 grms. bichromate of potassium in pieces of the size of a pea, 500 grm. common hydrochloric acid, 200 grm. nitric acid of the common strength, and 30 grm. bisulphid of carbon are mixed in a flask, filling it to one-fourth of its capacity and loosely stoppered. It is kept cool in the beginning and shaken from time to time. In about eight days the process is finished. In direct sunlight only four days are required. By addition of water the chlorid and nitrate of potassium are dissolved, and there remains the insoluble trichlormethyl-sulphon-chlorid. It is filtered off, washed, and pressed between sheets of filter-paper."

Fossil Reptiles in Brazil.—Professor Marsh describes the tooth of a large Crocodilian, of a species new to science, from Bahia. Other reptilian remains from Brazil, together with divers fishes and other fossils, collected during the past six or eight years, will be described in a forthcoming work on the geology of that region, by Professor C. F. Hartt, of Cornell University. Professor H. was, in 1867, engaged in an exploration of the coast of Brazil, and himself collected many of the specimens, which were submitted to Professor Marsh for examination and description.

Complementary Colors by Reflected and Transmitted Light.—A plate of glass is coated with a layer of the violet colored ink, made from aniline color, now much used, and allowed to dry. If we place this in such a position that light is reflected from its surface to our eyes, it will appear of a metallic golden color, as though coated with a gold bronze; but if we look through it at the light, the color will be a rich purple. Salts of the sesquioxide of chromium, which are green by reflected, are red by transmitted light; a solution of ordinary litmus is blue by reflected, but red by transmitted light.

Number of the Stars.—Herr Von Littrow has prepared and presented to the Vienna Academy an enumeration and classification of the stars in the northern hemisphere. According to this, the total number of stars in that hemisphere, of from the first to the sixth magnitude, is more than two thousand millions.

Chemical Action Arrested by Pressure.—M. Cailletet is investigating this subject. In one of his experiments, sulphuric acid remained in contact with an excess of zinc in a revolving tube hermetically closed, for twelve days without becoming saturated.

Farming and Gardening.

Agricultural Progress—Herr Schnell and his Enterprise.

The introdnction of new branches of agricnlture into our extensive domain, and the ntilization of lands hitherto considered of but little value, is one of the most important considerations connected with the future growth of California. Gold and grain have hitherto been our standard staples, and in their prodnctiou no country on the globe can excel us; but we need variety in our productions, and we mnst have it if we would draw around us a dense population, and reach that climax of prosperity to which all Californians are looking.

We have been talking about wine and silk and tea for many years, and, to all appearances, with a very satisfactory degree of success. Our fame as a grape-growing and wine-producing State is now quite well established, and the business has already reached an extent and importance, which renders its future development into a leading hranch of industry a matter of undoubted assnrance. The same may be said of silk. The present condition and future prospect of this latter husiness in California is dwelt upon at length in another column of this issue.

The cultivation of tea has for several years been intimately associated in the minds of Californians, with the production of wine and silk. The few experiments already made in this State, coupled with the more extensive and practical ones in Pennsylvania and Georgia, had already fully impressed the minds of many of the more thoughtful of our citizene with the idea that this leading product of Chincse industry might be successfully transferred to the Golden State. Much, however, as we were anticipating in this direction, the pnblic was hardly prepared for the important enterprise which our newly-arrived coadjutor, Herr Schnell, has already set on foot. The promptness and confidence manifested in the unheralded movements, and the magnitude of this undertaking, affords the surest guarantee of his thorough acquaintance and ultimate success with the same.

A most important feature connected with this enterprise, is the mixed character with which it has been clothed. Agriculture, unlike most other occupations, never flourishes when undivided attention is given to a single production. Our wheat growers are already finding out this fact, at the cost of a dearly-bought experience. Herr Schnell, profiting by the experience of the oldest agricultural people on the globe, has wisely recognized this fact at the start, and will introduce at one and the same time the culture of the mnlberry, the tea plant, the grape, the bamboo, the wax tree, rice, etc. The plantation eystem, with its thriftless and exhaustive character of cultivation, will be entirely ignored. Each family will have its allotted piece of land, cultivate its own trees, feed its own worms, spin its own cocoons, and receive pay therefor according to the quantity and quality of product. This system secures personal interest and personal care in the entire process. Tea and other products will he cultivated on the eame principle. The several families will cultivate their own tea gardens, pick their own leaves and deliver them to the factory, where the curing process will be carried out in a uniform manner, so as to secure a known product and a reliable market.

The cultivation of the tea plant forms the most interestiug feature connected with this enterprise. The Japanese whom Mr. Schuell brings with him, are particularly ekilled in this business, and express themeelves highly pleased with the capacity of our soil and climate for that culture. The p'aut rather prefers elevated situations, and thrives best on ligh', stony ground—just the character of our foot-hills. A continued sunshine is all important in perfecting the juices, and color of the leaf. Rain is very detrimental to them, especially in the latter part of their growth. Good tea cannot be made from leaves plucked in rainy weather. Four hundred pounds of tea, it is said, have been produced on an acre of ground in Pennsylvania, and a much larger production may he expected here. There is no question whatever as to the superior fitness of California for this branch of industry; and we look confidently for the time when our foot-hills will be covered with tea plants, not for our own consumption alone, but for large export to the Eastern States.

The Dusty Side for Farming.

All intelligent observers must have noticed that the trees along the leeward side of much frequented roads, especially when exposed to the influence of prevailing winds, manifest a luxuriance of growth, superior to those upon the opposite side of the same road. The same fact has often been noticed, wheu traveling between opposite grass, or wheat fields similarly located. More careful attention has recently, and with good reason, ascribed this fact as due to the dust from the road, which is carried into the field by the wind. Dry road dust, such as is raised and swept away hy the wind, contains from eight to ten per cent. of organic matter which may have fallen in the road and been finely pulverized by the passing wheels and hoofs. This matter is in just the state to enter rapidly into decomposition, and form a readily soluble nourishment for vegetation. An intelligeut Eastern farmer, who has been among the first to observe this fact, says: "When I buy a farm for one of my sons or daughters, I always select it on the dusty side of the road." Dust is very annoying to the senses, and in a rainless climate like this, it may sometimes be injurioue to vegetation, especially when it adheres firmly to the leaves of such trees and plants as exude a slight gummy fluid to mix and form a sticky substance with the dew. But street dnst is always very fertilizing, and, on the whole, beneficial rather than otherwise, especially when occasional raius occur to wash it from the vegetation on which it may have lodged. It is in snch, at first, uuapparent causes, that an explanation of many of the declared mysteries of vegetation may be found; and that man will be most likely to succeed as a farmer, who is of an observant turn of mind, always eeeking for information, and ready to make the best possible use of it when required.

To Keep Birds from Cherry Trees.

Every one who has grown cherries has no doubt been vexed and disappointed to find that just as his finest fruit becomes nearly ripe it is devoured by multitudes of different kinds of birds. A resort to shooting not only injures the trees, but in the end works a serious damage by killing off the insect destroyere. Moreover, destroying a few birds in one or two localities, in any manner, does but little towards getting rid of the annoyance, while putting nets over the trees is an expensive and impracticable arrangement in an extensive orchard. A suitable scare-crow is probably the hest remedy. The difficulty with this is that no ordinary device of that kind will answer, as the birds soon find out the "cheat" aud cease to mind it. The best thing is to get a good-sized stuffed hawk, and set him, with distended winge, upon a tall pole overlooking the trees. Don't put him up, however, until the birds begin to eat the cherries; for, until that time, they are your best friends, in daily consuming au immense quantity of insects, which would otherwise annoy you. Take the hawk down as soon as your cherries are gathered, so that the birds may once more commence their friendly work. If you are a good gardener and a humane person you will leave a few cherries on the ends of the limbs for the benefit of the little warblers. Such thoughtfulness will hring them back all the quicker after their enemy is removed.

Those who have tried this device at the East, and many have done so, speak highly of its efficiency. They report the consternation of the hirds as quite amusing when on coming for their usual meal they get the first glimpse of their well known enemy. The sndden wheeling and twittering, and flying off on the double-quick, assures the gardener that his cherries will now be allowed to ripen unmolested. One hawk will sometimes answer for half a dozen trees. Of course you must first catch your hawk—a matter of some difficulty, we apprehend, in this country. But it would pay well to send to the East for them. We have seen it stated that they can be bought in New York for a dollar apiece, properly etuffed. One hawk will often save $20 worth of cherries or more in a single season; and if taken care of, will last, in our dry summers, for an indefinite number of years. Perhaps we may have some other birds on this coast that may be more easily obtained, and which will answer every purpose. It may not he too late for some of our cherry-growers to try this experiment even the present season.

The Bamboo.

The bamboo, the culture of which is about to be introduced into this State, by the Herr Schnell Japanese Colony, is a very interesting and important plant. The Chinese reckon not less than 60 varieties. The plant is an arborescent grass, and forms the connecting link between the true grassee and trees. It sometimes grows to the hight of 60 feet; but usually not more than 30 or 40. In diameter it varies, according to kind, from one to eight inches. The Asiatics employ it very extensively for roofing purposes, and sometimes construct entire dwellings of it. The Chinese sometimes make boots of it, and also use it for the manufacture of ropes, sails, and cloth for various purposes. The pith is used for lamp aud candle wicks; while the firmer outside covering softened, flattened and dried again, is by carving and inlaying, wrought into various and beautiful ornaments. Pencils are made from it for the scholar, and brushes for the artist. Its roots are carved into various ornamental or grotesque characters. The ehoots of the young plant are preserved as sweetmeats and as food. The young sprouts, when boiled, partake very much the nature of asparagus; they are exceedingly palatable and nutritious, and are of mammoth proportions, compared to the asparagus of our gardens. In short, there is scarcely anything in China, either on land or water, into the composition of which bamboo does not in some way enter. The plant does well on a comparatively dry soil, which should be loose and sandy; although it is usually grown on the banks of rivers in China, for the double purpose of economizing ground, and to give support to the river banks. If the roots, however, reach permanent water, the plant dies. It is multiplied by cuttings, and will no doubt take kindly to the foothills of California.

Plants that Grow Well in the Shade.—All the broad leaved evergreens will grow in the shade of trees, provided the roots of trees do not exhaust the soil. Kalmias, rhododendrons, daphne, tree box, ivy, vincas, etc., sweet violet, hepaticas, eome of the campanulas, dicentra, bloodroot, and several of the herbaceous spirzes and saxirages will do well.

Farmers in Minnesota are paying 24 per cent. interest for money to hold their wheat, uot wishiug to take 80 or 85 cents for it.

Window Gardening.

There is a German synonym for flowers, having the beautiful significance of "Smilcs of God;" and there seems to be a universal love for flowers everywhere implanted in the human breast. Flowers are always regarded as one of God's latest and most heantiful gifts. It is a singular fact, revealed to us by geological researches, that the rose, the queen of flowers, is of recent origin—it nowhere occurs as a fossil. Its appearance on earth must have been nearly or quite coeval with man. Some portion of our premises should always be set aside for the nnrture aud enconragement of these beautiful creations. It is in the power of every one, rich or poor, high or low, to secure some bright sunny spot, which may gladden the heart with the lovely and heautiful, of which flowers are ever the expression.

If you cannot have a garden anywhere else, make it in your window. Window gardening is always in the reach of every one. The roughest box of unplaned hoards is better than nothing; and yon can surely plant something there which will grow to delight you with its beauty, refresh yon with its fragrance, and impress the stranger that passes your door with feelings of pleasure and regard for those who dwell within. There is nothing more attractive to the eye of the outsider than plants and flowers in the windows of houses where no spot of earth is spared to the tenant hy the encroaching inroads of brick and mortar. Here is what the editor of *Hearth and Home* says of "window gardening:" "There is a love of plants so interwoven in the make up of many people, that it will gratify itself under the most adverse surroundings. To those who are blessed with this love—for it is a blessing—no hrick aud mortar of the city, nor newness of a backwoods dwelling, prove any obstacle. As we go about the streets of our large towns, we admire the well kept places, but not the less do we stop to note the humhle efforts at horticnlture that are made upon window sills or upon some favoring roof. What pleasure often grows in a discarded eauce-pan or other domestic utensil, which, having served well in its proper ephere, is glorified by being the home of a balsam or an aster."

Moss on Flower Pots.—Ladies who are fond of cultivating flowers in the house, will find great benefit to the plants by spreading a coat of moss over the earth in their flower pots. This keepe the water from evaporating, and the temperature more uniform. Tea grounds are often used for the same purpose. Where a flower pot etands in a saucer, with a hole in the bottom of the pot, put a littlo sand in the saucer, and cover it with moss, and you have a simple and admirable arrangement.

New Way to Kill Weeds.—Beecher says that the only way to exterminate the Canada thistle is to plant it for a crop aud propose to make money out of it. Then worms will gnaw it, bugs will hite it, birds peck, heat will scorch it, and mildew and blight will cover it.

One of the aims in farming should be to produce as far as possible everything you need to consume—to buy nothing you can raiee yourself.

Boston Peace Jubilee.—O'Baldwin, the Irish Giant, is to beat a mammoth bass drum, eight feet in diameter. Each head of this drum rcquired, for its making, the hide of a mammoth ox; it being found,—says the New York *Tribune*,—impossihle to procure the hide of an elephant!

Northern capital is rapidly investing in Southern real estate. A New York gentleman bought 14,600 acres of rice and timber lands in South Carolina for $40,000, and 24,000 acres of plantation land in the same State for $28,000.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

San Francisco, June 19, 1869.

Financial.

Money is not over-abundant in this market just at present; but for the prosecution of legitimate business there is no actual stringency. The pressure is more severe upon domestic produce, the prices of which depend upon the markets of consumption where they are at a low ebb. There is no activity in real estate, and nearly all stocks are more or less depressed. No disposition is evinced to make anticipatory purchases of incoming crops, as no one can possibly form any accurate estimate of the demand or the prices that may rule when they are actually in market. Business is, however, conducted on a sound basis, and the disposition to economize is more pronounced.

A new savings bank, entitled the "Union Savings Bank," has been incorporated in Oakland, and will commence operations on the first of July. Its officers are as follows: President, A. C. Henry; Cashier, H. A. Palmer; Directors—John B. Felton, J. West Martin, A. C. Henry, John C. Hays and E. Bigelow. There are several other localities where the establishment of savings and loan institutions would prove valuable auxiliaries to local interests. Los Angeles, for instance, offers an excellent field. It is the center of large vineyard productions, which are steadily increasing in number and value, and has also extensive farming and stock raising interests.

The U. S. ship Pensacola recently arrived from Mexican ports with specie to the amount of $360,000, and the steamer California brought $133,000 from Victoria.

Crops of all kinds throughout the State look promising and will give heavy returns in a majority of districts, while in others, where careless and inefficient farming was done, the yield will be proportionably small. Considerable hay has been spoiled in the sea-coast counties by heavy fogs and light showers; nevertheless, the supply will be ample. It is a noteworthy fact that while comparatively new and fertile lands in the Western States have diminished their yield of wheat per acre nearly 30 per cent., the old and apparently exhausted lands of New England have given an increased return equal to 20 per cent. This is the legitimate result of careful and intelligent farming. It pays better to realize 60 bushels per acre from 100 acres than to obtain only 30 bushels per acre from 200 acres. We see it stated in an Eastern contemporary that a farmer in Pittsfield, Mass., with the aid of a corn planter, actually planted 2,720 hills in 54 minutes, or nearly an acre to the hour.

Bullion is in light supply, but the demand is not very active. We quote gold bars at 870@880; silver bars remain unchanged, from par to ¼ per cent. premium; currency bills on Atlantic cities pay 35 per cent. premium on gold; coin drafts, 1½ per cent. premium; telegraphic transfers, 1¾ per cent. premium; sterling exchange, 48¾d; commercial exchange, 49¼d; Mexican dollars, 5@6 per cent. premium; gold in New York, June 18th, 137¾; Legal Tenders in this market, 73¾@74.

Unusual activity prevails in all the navy yards of the country, while men are being enlisted in great numbers at all the rendezvous. Orders have been given to place every war ship in the navy in commission with the greatest dispatch. The monitor Monadnock has just been got ready for service with a full complement of men, arms and ammunition. We can form no idea why these formidable preparations are made, but have no doubt the Government is acting on well-advised grounds. It is possible that the recognition of Cuba has been resolved upon, but we are by no means prepared to assert it as a fact. It is very certain, however, that the Government will initiate nothing of a hostile character against any other power, but is determined not to be caught napping.

The citizens of Santa Barbara are moving to build a road to Tulare county for the purpose of attracting the trade of Kern river, Lone Pine and White Pine, as they claim that it will give the shortest and most direct route from the interior to the sea.

The Exports of Treasure from June 1st to date, have been as follows:

June 1—Per Golden City—		
To New York	$ 87,524 81	
To England	669,960 54	
To France	7,000 00	
To Panama	20,000 00	
		$ 784,485 35
June 4—Per China—		
To China	$743,008 20	
To Japan	426,954 08	
		1,170,052 28
June 9—Per Montana—		
To New York	$ 50,000 00	
To England	235,365 76	
To France	38,852 17	
To Central America	151,158 42	
To Panama	23,200 00	
		498,576 35
Total since June 1st, 1869		$2,453,114 08
Previously this year		15,970,193 98
Total since January 1st, 1869		$18,423,308 06
Corresponding period, 1868		18,939,431 42
Decrease this year		$516,123 36

The duties paid at the Custom House, in this city, from June 11th to date have been as follows:

June 11	$ 7,290 45
June 12	18,241 10
June 14	53,408 90
June 15	28,583 49
June 16	21,498 26
June 17	28 315 14
Previously in June	188,353 15
In June to date	$345,695 49
In May	575,030 24
In April	554,882 05
In March	780,447 40
In February	692,340 00
In January	532,997 97
Total since January 1st, 1869	$3,391,393 15
Corresponding period, 1868	3,699,864 55
Decrease this year	$308,471 40

City Stocks.

The Stock Board sales during the past week of miscellaneous securities were confined to a few companies, and in amount quite small. Spring Valley Water Co. stock realized $35 25@35 per share. The annual meeting of the stockholders of this company will be held at 12 o'clock, M., June 19th.—Five shares of California Steam Navigation Co. stock sold at 57 per cent. A dividend of 1 per cent. per month, aggregating $25,000, is payable since the 15th inst.—Omnibus Railroad Co. disbursed its usual monthly ½ per cent. dividend on the 15th inst. The annual meeting of stockholders will be held on the 5th of July next.—The California Powder Works disbursed a dividend of 1 per cent. for the month of May, amounting to $3,000, on the 14th inst.—The California Insurance Co., at a meeting held on the 16th instant, adopted a resolution to increase the capital stock from $200,000 to $300,000. The additional amount of stock will be placed to outside parties at the rate of $1,600 per share of $1,000.—Five shares of Bank of California stock were sold in the Board, on the 16th inst., at $150 per share. Offers were immediately made for any part of 500 shares at the same rate. This institution paid its usual monthly dividend of 1 per cent., equal to $50,000, on the 15th inst.

Mining Share Market.

The mining share market during the past week experienced a very material decline from prices previously obtained, and a falling off of business is also noticeable; however, the number of stocks dealt in embraces more than the usual variety, including a larger number of White Pine stocks. The latter description of stocks is receiving increased attention at the hands of San Francisco dealers, which has not been the case heretofore. Further satisfactory developments through the efforts of California and Nevada capitalists have produced this reaction, and henceforth we may look for a very fair business in this line of stocks. Considerable quantities of bullion are beginning to make their appearance from the White Pine district, which will be augmented as mill facilities increase. At the close a much better feeling prevails and the various descriptions of stock, with but few exceptions, show a considerable improvement.

Chollar-Potosi—sold to a moderate extent, at a heavy decline. In our last issue a serious error occurred in reference to this company. The annual report credited to the Chollar-Potosi should have been to Crown Point, and the closing paragraph of the statement, after the word "Secretary," should have been under the heading of Chollar-Potosi. During the week ending June 11th this company extracted 1,823 tons of ore, against 1,477¾ the previous week, and forwarded 1,477½ to the mills during the same time, leaving on hand 345½ tons. All the faces in the Blue Wing stope are reported to be producing good ore in increased quantities. The New Tunnel developments are affording excellent ore, showing an excess over previous yields. The branch drift to the Grass Valley deposit from the Potosi tunnel is in ore, and the indications are that the main body is further west. On the 14th inst. the ore slip shows that 266¾ tons were delivered to six different mills on that day.

Gould & Curry—changed hands in small amounts and reduced rates. The report for the week ending June 14th shows that 434 tons of ore were taken from their upper works, and that they shipped 319 tons to the mills for reduction, leaving 403 tons on hand. The timbering of the shaft has been completed, and the sump is 18 feet in depth below the station set. Fifteen days more will be required to put the shaft in good condition, after which the opening of the seventh station will be commenced.

Hale & Norcross—exhibits a very material decline. During the week ending June 12th 1,300 tons of ore were extracted, and in the same time 919 tons were delivered to custom mills, leaving 1,382 tons on hand. The fifth station developments produced 759 tons of the above amount. The various stopes are reported to be looking well.

Kentuck—has been pretty active under a sharp decline. An assessment (No. 1) of $10 per share was levied on the 14th inst.—Savage has been less active, but has also receded from previous prices.—Imperial shows no change for the better in its lower workings. The annual meeting of stockholders will be held on the 29th inst.—The Ophir drift was in 361 feet on the 15th of June.

Amador (Cal.)—continues to be well maintained. A letter of the 14th states that the north shaft is down 101 feet below the San Francisco level, and that they are working toward the Badger drift, in which the vein is increasing in size. All the stopes are looking well. The May receipts aggregated $61,576, and the first clean-up the present month will yield nearly $30,000 in bullion.

The Golden Chariot (Idaho) paid a dividend of $3 per share on the 15th inst.—Of White Pine stocks we make note as follows: Noonday levied an assessment of 30 cents per share on the 14th.—Consolidated Chloride Flat levied an assessment of $3 per share on the 28th of May.—Mammoth levied an assessment of 25 cents per share on the 20th of May last.—Aurora Consolidated reports a shipment of bullion amounting to $7,337, contained in five bars, the fineness of which ranged from 912 to 994. One hundred tons of ore were shipped to Avery & Co.'s mill on the 13th, and the present week shipments have been made to other mills.—Large sales of Original [illegible]din Treasure were made during the past week. The 76 tons of ore recently reduced at the Newark Mill yielded over $8,200 in bullion, without a thorough clean-up. The ore will probably average $120 to $130 per ton. A lower grade ore is now being sent forward, which will yield about $80 to the ton.

Real Estate in Chicago and this City.—A piece of unimproved real estate was recently sold in Chicago at the rate of $3,400 per front foot—about $2,600 in gold. This was the highest price ever paid for real estate in that city; and yet it is considerably lower than property similarly situated in this city. The highest price paid for real estate in this city was $3,000 per front foot, at the corner of Market and new Montgomery streets.

Weekly Shareholders' Directory, for Meetings, Assessments and Dividends.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Plantation Bitters Denounced.—While the community at large entertain and express the highest opinion of Drake's Plantation Bitters, as an invigorating and restorative preparation, there is one class of society that cannot be induced to regard the famous tonic in a favorable light. The fraction of the body politic referred to consists of mean boarding-house keepers. They say that the Bitters interfere with their pecuniary interests. In former days, young men generally were in the habit of indulging freely in bar-room liquors, and the result of an overdose of any of these adulterated stimuli at night was nausea and a distaste for food next day. Many a days' rations was thus saved by the proprietors of the caravansaries in question; but now that the Great Vegetable Stomachic has, to a considerable extent, supplanted all the unmedicated stimulants, and almost every young business man keeps a bottle of it by him to give tone and vigor to his system; the boarding-house interest complains that its guests are twice as hearty as they used to be, and that the beefsteaks and buckwheats suffer accordingly. They are, therefore, violently opposed to the use of this agreeable and potent appetizer.

***

If the type of your evening paper begins to look small, dim or indistinct, apply at once to C. Muller, 205 Montgomery street, for a pair of his A No. 1 Spectacles. *

Job Printing.

We employ the best workmen in this department, and promise our customers—(many of whom have patronized the office for over eight years)—the best of work at very fair and uniform rates.

We are constantly adding new presses, type, and other material to our stock, making our facilities good for doing a wide range of work for merchants, mechanics, inventors, manufacturers, and tradesmen of all classes.

To Engraving and Electrotyping, for illustrating books and circulars, we pay particular attention, guaranteeing our customers satisfaction in this line difficult to be secured elsewhere.

Printing in colors, bronze, plain and ornamental style promptly done. Especial care given to working engravings

SPAULDING & BARTO,

"Mining and Scientific Press" Job Printing Office,

No. 414 CLAY STREET, S F

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

The Mountain.—*Chronicle*, June 5th: This week we found the boys pnshing ahead toward the ledge. The rock continues hard, but with the aid of Giant powder good progress is heing made. The tunnel is now in 1,610 feet.

Tarshish.—*Miner*, 5th: The managing director has since his arrival heen quietly making drafts upon various parts of the mine for ores and having these tested. From numerous assays he finds the ledge matter ranging all the way from $14 to over $500 per ton in gold and silver. The examination as to quantity has been fully as satisfactory; these ores heing found, to the north and sonth, 150 to 180 feet.

AMADOR COUNTY.

New Quartz Mill.—*Ledger*, June 12th: The mill of the Amador Mining Co. at Sutter Creek is fast nearing completion. It is adjoining the old one, and of the same capacity—forty stamps. Two new boilers, weighing 8,000 pounds each, will supply the steam.

Summit Mine.—The owners have commenced erecting hoisting works on their north shaft. The prospects of their mine are daily increasing.

CALAVERAS COUNTY.

Enormous Yield.—*Chronicle*, June 12th: Eighteen tons of qnartz from the mine owned hy Peter Gass, at Mosqnito Gulch, yielded $1,165. We are informed that the lead shows a width of three feet, and has every appearance of being a true vein. The lead is within a few rods of the main road to West Point, near the old Vance mill.

Lower Rich Gulch.—The 16-stamp battery on the Palomo is crushing 35 tons of rock per day. Since the completion of the steam hoisting works no difficulty is experienced in ohtaining rock as fast as it can be crushed. Alexander & Co. have ore steadily increasing in richness. The chunks of amalgam taken from the battery resemble a "half bushel" in size more than anything else.

West Point.—The quartz mining interests are rapidly improving. Labor is being resnmed on most of the claims, and bnsiness of every character is looking up.

Railroad Flat.—Forty tons of ore from Sanderson, Gay & Co's mine, crnshed at Smart's mill, netted $2,000. The rock was unassorted. The Company are still crushing ore of the same quality. The lead has been developed to a depth sufficient to demonstrate its permanency heyond a doubt.

INYO COUNTY.

Cerro Gordo.—Los Angeles *Star*, May 29th: Thirty-five pounds of silver bullion recently brought from tho mines of Wolfskill and Cervantes, at Cerro Gordo, near Owen's River, was smelted from the ore at the works on the ground.

EL DORADO COUNTY.

Mendon.—Correspondence of Placerville *Herald*, June 2d: The Crystal Co. take out from 60 to 80 ounces of gold every week with a small 8-stamp mill. Their ledge increases in width and improves in richuess as they go down. Work is being prosecuted ou the Stillwagon mine. It has already made its owners rich with a little 5-stamp mill. The Independence Co. are sinking a shaft. They are now down about 80 feet, and ahout 25 feet below the bed of the river. The ledge has gradually increased from 10 inches to 2½ feet. The rock contains a very large percentage of sulphurets, and pays in free gold from $25 to $40 per ton. The sulphurets assay from $95 to $400 per ton. They save all their tailings, and intend putting up machinery for working sulphurets and tailings. They also inteud to erect permancnt hoisting works. The Quail Co. have taken out 33 tons of rock, which they had crushed, aud obtained 33 ounces of clean gold. Mr. Douglas is putting in a cnt from 18 to 30 feet deep and 4,000 feet in length, to open up several hydranlic claims which have paid immeusely but can not he worked further for want of fall.

NEVADA COUNTY.

Wisconsin.—Grass Valley *Union*, June 8th: Down 360 ft. on the iacline, with good supply of ore.

Allison Ranch.—Pumping is still the order of the day, together with crushing the old dump pile. The dump is payiag well. The company are puttiug in a new separator, invented by Major Hough.

Perrin's miue is paying steadily....The Higgins ledge has come in good agaiu.... The Hartery yields a constant profit.

Empire Shut Down.—Same of 13th: Capt. Lee has attempted to keep the mine rnnning. At times he has succeeded in obtaining a tolerahle force of men, and on Friday had a greater numher engaged than at any time since the strike commenced; but owing to persnasion, intimidation and threats, on the part of members of the Miners' League, his force has been constantly changing, and so seriously has he heon inconvenienced that yesterday he discharged all his workmen, and suspended operations. He informs us that the mine will remain closed from two to three months.

Wm. Penn.—The shaft is down 125 ft., and a drift is heing run on the ledge 50 ft., for prospecting purposes. We saw some rock yesterday from the drift, showing unmistakahly in free gold. We are informed that the company intend soon to sink the shaft deeper.

Co-operative Mining.—We learn that some of the miners engaged in the strike, have it in contemplation, to lease several idle and partially developed mines, and work them on something like the coöperative system. It strikes us that a movement of the kind will be attended with good results.

Kentucky.—*National*, June 7th: This mine is 900 ft. northeast of the Eureka, and promises to be an excellent one. The ledge in the shaft is three ft. wide, and the rock has crushed at the rate of $24 per ton. The sinking only costs $8.50 per foot, and for every foot 1½ tons of rock is taken out. The owners have incorporated.

Quartz Mill Burned.—Nevada *Gazette*, June 14th: The Jim Crack quartz mill, in Eureka district, was destroyed by firc on Friday. It was a 10-stamp mill, erected last season, and we understand that everything connected with the structure was destroyed. It was owned hy A. A. Veatch, who is at the mine, Alphens Bull, of San Francisco, and others.

Mining at Blue Tent.—The Cressy hydraulic claims are paying well, although the company are working off a bench of gravel. They cleaned up $2,100 after a run of 17 days, 150 ft. above the bedrock.

Good Rock.—Lindsay & Co., near the mouth of Cañon Creek, above Washington, are crushing rock at their 4-stamp mill which is yielding on the average $40 a ton. Their ledge is well defined and all of the rock pays.

Pittsburg Mine.—*Transcript*, June 12th: The 10-stamp mill now runs only in the day time, but in July it will run day and night, crushing 20 tons of rock every 24 hours. There are two 60-horse power engines. The incline from the mill is 530 ft. deep. At the hoisting works are two engines, one of 40-horse power and another of 60. A railway extends to the mill, over which cars are run, and the rock dumped at the foot of the battery. This incline is down 580 ft. The ledge looks better than ever before.

Mining on Deer Creek.—Tho Chinese Co. on Deer Creek, have erected extensive flumes and sluices, and are employing 15 or 20 men. They are mining out the bed of the creek, and we are informed they find it profitable.

Loyal Co.—Same of 13th: This company propose to run a tunnel to tap a gravel channel in the west side of Cement Hill ridge, and in that distance they expect to reach a point 30 ft. helow the bedrock of the channel, giviug sufficient fall to work it to advantage.

PLUMAS COUNTY.

Black Hawk.—Quincy *National*, June 4th: Turner, Rice & Co. have finished piping for the season, and will commence cleaning up the coming week.

Indian Valley.—Correspondence of same: The Green Mountain and Caledonia will both start up in a few days. The Crescent is now running on good rock. Judkins & Kellogg are taking out $2,500 per week; Indian Valley, $1,500, and the Genesee Copper Furnace is turning out about two tons of copper per week. The placer miuers on Grizzly Creek are making about $6 per day to the hand; on Light's Cañon, about $4.

SAN BERNARDINO COUNTY.

Green Lode.—*Guardian*, June 17th: We hear that operations are beiug commenced on this mine, 40 miles from San Bernardino and 8 from Holcomb Valley. G. H. Pond, a White Pine miner, lately from that section, will sink a 300-foot shaft from a tunnel level of 200 fect.

SIERRA COUNTY.

Iowa Mining Co.—Downieville *Messenger*, June 12th. This Co., near Mount Pleasant Ranch, has ahout 500 feet of tunnel to run to tap the shaft. The tnnnel will, in all probability, be completed and the work of taking ont gravel be commeuced this fall.

Still Running.—The Montpelier Mill is still running upon Ned Leonard's rock.

Dried Up.—Water has about dried up in the hydraulic diggings of this county.

SISKIYOU COUNTY.

Quartz Mill at Oro Fino.—Yreka *Union*, June 12th: H. T. Sheppard has made a contract with Trimhle & Co. to erect a quartz mill. Trimhle & Co. already have an arastra, propelled by water power, and the wheel now used for running the arastra will be used for running the mill. They are satisfied that they have a good ledge. There are several other ledges in the vicinity which are known to be rich. A mill for custom work is a great desideratum in that vicinity. The mill to be constructed will have sufficient capacity to work more rock than the owners will be able to supply from their own ledge. It will therefore he available for custom work a portion of the time.

Etna.—We understand that this company are obtaining exceedingly flattering prospects in their claim, having got as high as $22 from one pan of dirt one day this week.

Shasta River Ditch.—This ditch was severely damaged hy the storm last Saturday. Some two or three miles of it were filled with gravel aud dirt. The work of cleaning it out and repairing damages is heing pushed forward with vigor.

TRINITY COUNTY.

Indian Creek.—*Journal*, June 12th: An enterprising miner discovered some rich ground on the hill back of the town, but some distance above the nearest ditch. As the only mode of working his claim, he has constructed a chute to the ditch helow, and has been working in this manner for some time with profit. He realizes $8 a day as the reward of his ingenuity.

ARIZONA.

Sterling.—Prescott *Miner*, May 29th: Work is being pushed. The south drift is in 50 ft., and the north 100 ft. Good quartz is heing taken out of the latter. Work on the mill is progressing slowly. It is hoped that the mill will be in rnnning order in four or five weeks.

We were shown this week, several pieces of rock from a lode recently discovered near the head of Lynx Creek, named the Stewart. The ore contained gold and silver in paying quantities. Three thousand eet have been located on the ledge, which, n places, is 30 ft. thick.

Upper Lynx Creek.—Bowers & Wells have their arrangements all made for flumiug and working, and will start up soon.

Granite Creek.—A party of miners have put in a flume helow the old site of the Quartz Mountain Sawmill. Their intention is to work the bed of the creek.

Wickenburg.—John Reese informs us that the mill of Reese & Krause was ready to run when he left.

BRITISH COLUMBIA.

Kootenai.—Dalles *Mountaineer*, June 4th: Messrs. Milby and Hicks, from the new diggings in the Kootenai country, report everything as flourishing. At present there are about 500 miuers, aud the mines are paying well. Mr. Milby showed us specimens, one of which weighed within a fraction of $100. The gold is very fine and assays over $18 per onnce. It is expected that there will he a big rush from Montana.

COLORADO.

Jamestown.—Boulder *Pioneer*, June 2d: Mr. Stewart yesterday showed us specimens from the Grey Eagle lode. One was a piece of chloride resembling first class ore from the Comstock. Another "chlorobromide," carried a heavy per cent. of gold and silver. This specimen had been roasted and globules of the metals spangled its surface. The shaft is 60 ft. deep and shows a vein, carrying 10 inches of the chloride ore, several tons of which are now on the dump.

Empire.—Georgetown *Miner*, June 3d: From Empire we learn that miuing is being carried on with activity, with the probability of a large gold product.

First invoice of miniug machinery for the Washiugton Association, arrived last week.

Bullion.—Shipment for the month of May: Stewart's Reduction Works, $9,360 coin value; Brown Company, 415 lbs., coin value, $6,474. Total, $15,834 coin value.

Huepeden & Co., will not make any report till the first of July. Our shipment for May, iucluding the amount by Huepedeu & Co., largely exceeds the shipment for April.

Jones Lode.—Central City *Register*, June 3d; This lode seems to be the great attraction at present. Several parties are taking out surface rock said to be very rich iu gold. One lot of several cords from Capt. Phillips' claim yielded 26½ ozs. per cord.

Black Hawk.—This mine at the present shows a body of ore, fully enough to keep the company's works running for six months to come. The receipts largely exceed the expenditures, and are constantly increasing.

Nevada Gulch Mills.—There are now seven stamp mills in operation, most of them on custom ore, and three or four others will be started within a few days. Jones & Hawley's building is nearly completed, the batteries up, the 15 stamps in place, and the proprietors confident that they will have the whole in operation inside of two weeks. Whitcomb's 12-stamper is steadily at work on custom rock. It is reducing nine cords per week with satisfactory results.....The old Beverly 8-stamp mill is undergoing repairs. It is leased by Mr. Handy, who will start it up in a day or two on custom rock. It crushes about six cords per week....The Kounce & Beverly 12-stamper has heen thoroughly overhauled and the batteries rehuilt in a substantial manner. It is crushing seven to eight cords per week....The New Bedford has heen running for some time past, on ore from the Forks lode, which yielded from five to eight ounces per cord. The Old Stoner 12-stamp mill, under lease by Mr. Chatfield, is crushing custom rock, six to seven cords per week, at an average yield of four ounces....B. C. Waterman's 12-stamp mill is running on ore from the Flack lode, reducing six to seven cords per week. The yield is from five to six ounces per cord....The Gilpin 18-stamper is being run by Mr. Conlee, on ore from the company's mine on the Burroughs' lode, of which he also has a lease.

The lowest yield that we have heard of recently, was three ozs. per cord, and that from only one small lot, while several lots have yielded 15 ozs. and npwards, and one lot from the Jones lode gave 26¼ ozs. In addition, it must be borne in mind that from the deep mines only the second class ores go to the stamp mills, all the rest being sold to the smelters, at prices from $35 to $100 per ton, and in some cases as much as $300 per ton. Many of the mines are raising a large amount of that class of ore, some as high as 60 tons per week.

Gold Hill District.—Erie Bottleson has got his stamp mill on Left Hand in operation. It is a 10-stamper, reducing surface rock from the Williams lode, on Gold Hill. The results have been satisfactory. The Hoosier mill is now putting in new crushing machinery.

An assay of ore from the Williams lode, yesterday, gave 25 ozs. gold, and 60 ozs. silver, per ton—$594.75 coin valne.

Quartz Hill.—Mining is lively. Parties have leased the Ayers property and are taking out dirt, which yields fairly. James O'Brien and James Taylor are working on the Tigress lode. Their ore prospects largely. Parties are preparing to sluice ahove the Leavenworth mill. Several abandoned claims are now being worked. Thos. Daily and James Livingstone have commenced working the Calhouu, aud are taking out nice looking ore. Geo. Mitchell is working the Alps and Mackie mines, and crushing tho ore in the Leavenworth 12-stamp mill. He has not received a dollar from the stockholders during the past three years, and has heen gradually reducing the old debt. The mines are now in good condition, veins well developed, and the machinery good.

IDAHO.

Minear Mill.—Silver City *Tidal Wave*, June 8th: R. H. Leonard has taken the mill and premises for a year, and will start up to-day or to-morrow on a small lot of ore from the first north extension of the Morning Star.

Baxter.—We witnessed the weighing of the first lot of bullion from the Baxter mine. The amount crushed was 126 tons; weight of crude bullion, 1,987 ounces, troy, value not known. This miue is uow down 190 feet with only one level. The ore crushed was first and second class thrown together, and was the product of the shaft and tunnel, the 190-foot stopes still left standing. Men are sinkiug in the main shaft again and intend to put it down another hundred fect and start another level. When this is done there will be 290 feet of stoping ground open.

Oro Fino Extension.—The second extension south of the Oro Fino, sometimes called the Peck & Porter claim, which has been in litigation, is relieved from further embarassmeut by compromise.

NEVADA.

HUMBOLDT.

Battle Mountain.—*Register*, May 24th: We have been informed that a new ledge, called the Mary Ann, hids fair to rival the celebrated Little Giant. The averago of several tests has been $250 per ton.

A Chicago Company is negotiating for the purchase of a mine in Gold Run District, in the vicinity of Golconda.

Placer mining is carried on in Star Creek, above the Sheba mill. The largest specimen that has yet been obtained is worth $6. Several pieces worth from $1 to $2 have been found.

Reports from Winnemucca Mountain are encouraging. In the Pride of the Mountain, at a depth of 225 feet, the vein was found three feet in thickness of solid ore, that will net $300 per ton.

REESE RIVER.

The *Reveille* of the 5th comforts the people of Austin by explaining the causes of its depression, predicting the return of the White Pinors at least, and advising everybody to take things easy. For its part, it intends to keep on cherishing the hope that "we may be happy yet."

GOOD NEWS.—Same of 12th: The Lane and the Fuller Co. have leased the mill of the Mettacom Co. The Buel North Star mine of the first named company is yielding a large quantity of high-grade ore, which, together with what custom ore they are sure to have, will keep the mill well supplied.

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

RUSHING BUSINESS.—Gold Hill *News*, June 7th: The Yellow Jacket is employing about 400 men, owing to the air in the mine being so hot as to compel the resort to eight-hour shifts; the drift communications with the Kentuck and Crown Point being closed on account of the fire, thereby shutting off the circulation formerly existing. The pay-roll of the Yellow Jacket amounted to $20,000 for the last month.

SIERRA NEVADA.—Same of 9th: This mine is now a decided success and a paying institution. Last month the yield was over $23,000. This month's will probably amount to $30,000. The ore is mined and milled with less expense than that from any other mine on the Comstock.

OVERMAN.—Repairs to the shaft have been completed, and work commenced from the 226-foot station up. It will require several days to put the shaft in order, during which time no ore can be taken out.

CROWN POINT.—Same of 12th: During the year ending April 30th, 25,833 tons of ore were extracted. Supt. Jones' report also says: The ore in sight is estimated at 2,500 tons; in addition there is a vast amount of low-grade ore remaining in the upper levels of the old west workings, which can be profitably worked upon the completion of the Virginia and Truckee Railroad. Explorations on the 1,000 and 1,100-feet levels were checked by the fire at the beginning of April, and have not yet been resumed.

IMPERIAL.—Nothing more encouraging. The old shaft yielded $43,000 in May.

Kentuck yielded enough to keep the Sunderland mill running....Overman shipped $17,000 in May....Gould & Curry repairing, and yielding 80 tons of ore daily....Ophir's drift now in 350 feet....Savage yielded $155,000 in May....Sierra Nevada is milling 45 tons daily....Hale & Norcross yields 150 tons per day....Chollar-Potosi about 175. Average $50 per ton.

WHITE PINE.

ITEMS OF MINING PROGRESS.—*News*, June 5th: We hear of two mining sales having been effected with eastern capitalists during the last few days. One for $25,000, and the other, conditionally, for $50,000. ....7th: Operations on the Little Bilk mine are to be resumed to-day. Already some very fine ore has been raised from the bottom of the shaft, which is one of the deepest in that locality.....The new strike in the Keystone shaft of the Eberhardt, shows rich chlorides, and will work about $200 to the ton.....8th: About the Hidden Treasure everything is lively. A large amount of ore is sent to the Centenary mill daily. Two large packs are not able to carry away the ore as fast as it is taken out. ....10th: It is now a well established fact that a great north and south fissure vein of wonderful richness runs through Treasure Hill, just back of Main street, and that the rich floors of ore on the three flats are overflows from this channel. The north end of the bill, and west from the Hidden Treasure mine, is now being worked with good prospects.....We were yesterday shown some ore from a claim recently discovered on the Base Range. It was almost free from base metals, and estimated to be worth over $2,000 per ton.....11th: Borcalis shaft is now down 12 feet.....12th: The Orient, between the Eberhardt and Mazeppa, shows rich chloride ore on the surface, and at the depth of 12 feet good milling rock..... Eight mills are in full blast and the streets are filled with teams hauling quartz from morning till night. The White Pine Water Co. has all of its machinery on the ground, and will have the water into Hamilton by the 15th of July, and into Treasure City by the 15th of August.

The *Inland Empire* of the 12th says: "The places of the hundreds who have left disgusted during the past month have to a great degree been taken by men of means and energy. Our mines are being developed, mills have been built, and business is taking a firm root. Our town will within twelve months from its birth be the largest in size, population and wealth in the State."

MILLS.—*News*, June 5th: The Manhattan mill started up on Tuesday, and is running like clock-work. It is the largest mill in White Pine County, having 24 stamps, and is the property of the Consolidated Chloride Flat Co....11th: The Centenary mill, at Newark, 22 miles from Treasure City, has a splendid 20-inch engine, a battery of 20 stamps, with 10 largest Greeley pans, 5 8-foot settlers, 2 clean-up pans, one 10-foot agitator, and other apparatus in full supply and fine condition. Crushes 20 tons a day, dry; and will be fitted with roasting furnaces. It is furnished with a melting furnace and assaying apparatus, and the product of the mill is turned out in silver bars, marked and guaranteed....*Empire*, 12th: The White Pine mill now has 10 stamps, and 10 more will be added. The work will be completed within 20 days....Correspondence of San Francisco *Herald*: The new California mill in Eberhardt Cañon is to have 30 stamps, 4 retorts, 2 melting furnaces, 16 pans, 8 settlers, 4 agitators. The ore house will have a capacity for 350 tons of rock; the breaker is to be capable of breaking 100 tons of ore daily; the kiln capable of drying 50 tons daily; the batteries to crush 50 tons per diem, and filled with automatic feeders. The mill is to be put up especially for the mines owned by the Messrs. Stanford, chief of which are the California and the Aurora South, the Jim Stewart, Evening Star, Mahogany, and Poorman; and the works, which will cover an area of 10,800 feet, are to be known as the Stanford mill. The iron work is from the Union Foundry, after designs by Mr. W. H. Patton, the engineer of the company.

BULLION.—*News*, 5th: Shipped on the 3d, by Wells, Fargo & Co., from Hamilton and the Newark mill, 17 bars of bullion, valued at $23,364.05.....7th: For the week ending the 5th, the different express and banking institutions shipped from White Pine bullion to the amount of $78,575.01. *Empire*, 12th: Wells, Fargo & Co. shipped overland, yesterday, four bars of bullion weighing 408 pounds, and valued at $7,558.46.....*News*, 11th: The estimated shipment of bullion for June from White Pine, is at least $500,000, and for September $800,000 to $1,000,000. The White Pinors say that they can now work out their own salvation, and will let the bullion do the talking for the district hereafter.

OUTSIDE DISTRICTS.—A 10-stamp mill is to be put up in Reveille district....A 20-stamper is nearly completed in Egan Cañon by the Steptoe Co....Reports from Patterson are highly favorable. Negotiations pending for several mills.....Clover Valley district is to have a 10-stamp mill..... New and promising district discovered 18 miles west of Meadow Valley... Sam. Brannan of San Francisco has bought,—says the *Empire*,—a part interest in a certain toll-road, ranch and mining property in Robinson district. The amount paid was $17,000. We learn that he will put on a stage line between Robinson and this city, and will immediately put up a 20-stamp mill.....The San Francisco Co., in San Francisco district, have commenced two shafts. They expect to strike rich rock inside of 30 feet, under the lime rock capping.

NEW MEXICO.

MORENO.—Santa Fe *Gazette*, May 29th: Maxwell's continues to be one of the best paying quartz leads in the country. The mill is constantly at work. Last week a clean up of $15,000 was made as the result of two days' run with 15 stamps. The vein holds out and the quartz gives no evidence of diminishing in value. We are told it is the intention to increase the number of stamps to 50.

Other leads have been discovered in the vicinity which promise to be equally valuable. Gov. Mitchell informs us that steps have been taken to procure a mill from Chicago.

Col. Anderson of the New Mexico Mining Co., informs us that the new machinery will be ready for operation in July. This will give 40 stamps with all the latest improvements. Seventy-five thousand dollars worth of ore has been taken out during the suspension of work.

Mr. Guttman, recently from the mines of the Arroyo Hondo Co., informs us that six wagon loads of the machinery for the quartz mill had arrived.

At latest dates the Moreño ditch was completed all but one mile, and would be finished by the middle of June.

It is said that rich placer diggings have been discovered in the neighborhood of Abiquiu, Rio Arriba County. The distance from the Plaza is reported to be about six miles.

WASHINGTON.

PERRY CREEK MINES.—The Walla Walla *Union* of the 29th ult. says: Mr. McGraugh arrived Tuesday, seven days from Perry Creek. The news is cheering. The day previous to his departure from the camp, a small party who had been prospecting 12 miles from the town, reported so favorably that over 250 claims were taken up in less than 48 hours. The creek is running high at present. Mr. McG. thinks it will be three or four weeks before miners are enabled to work their claims. There is a new camp some eighteen miles from the town on the Mo-Yeah, a stream which runs nearly parallel with Perry Creek, on which had been obtained equally good prospects.

OREGON.

ROCK CREEK.—Dalles *Mountaineer*, June 4th: From Mr. Thornhury, of Camp Watson, we received a small package of gold dust taken from the mines lately discovered on Rock Creek, east of Camp Watson. These mines are said to be extensive and rich.

MYRTLE CREEK.—*Oregonian*, June 6th: More than one hundred men are working and prospecting the gold mines on Myrtle Creek, in Douglas County. Considerable gold is obtained, and there is a good deal of excitement.

WYOMING.

SILAS WRIGHT.—*Sweetwater Mines*, June 2d: This ledge, owned by Dr. Leonard and L. U. Colbath is proving one of the best in the district. At a depth of 20 feet they have an 8-foot vein and free gold. It is easily worked, and two men average over four tons per day. Eddy's mill commenced crushing Silas Wright rock on Monday.

WORLD BEATER.—This ledge is looking splendidly. Men are constantly engaged in taking out quartz.

ATLANTIC CITY.—Some 75 men on Rock Creek are making big wages. All the claims on Atlantic Gulch are being opened, and it is the intention to commence sluicing in two or three days.

Pease & Co. are running their arastra day and night on rock from the Mary Ellen, and are crushing about one ton and a half every twenty-four hours. The Mary Ellen is classed with the rich ledges, and expect a handsome yield.

Silver Placers.

Silver is never found like gold in grains among the sand, to be washed out by hand, but in ores of quartz, from which it must be reduced by stamping or grinding, and sometimes by smelting.—*A. D. Richardson on mining.*

Commenting on the above, the Georgetown (Colorado) *Miner* says: "We beg leave to differ with Mr. Richardson. He does not know everything about silver mining. He should come to Colorado and learn from old prospectors and miners before he writes another article on mining. We take great pleasure in publishing the following extract from a letter written to us last January by William P. Pollock, clerk and recorder of Summit County: "It was no rare occurrence for the gulch and bar miners of Miners' district on Blue river, in 1860 and 1861, to find among their "clean ups" nuggets of almost pure silver.

"In the winter of 1861, J. J. Cobb, Esq., of Parkville, Georgia Gulch, traded an ounce of gold dust for an ounce silver nugget, which was taken out of Blue river, above Breckenridge about two miles, and which assayed at the U. S. mint at Philadelphia, 909-1,000ths fine, and reported by the assayer of the mint to be the purest specimens ever received at that establishment." The knowledge in regard to finding native silver in the clean ups in the Blue river diggings, is not confined to a few men. Native silver is also found in the clean ups near Tarryall and Park County.

LUTE FOR BENZINE BOTTLES.—*Dingler's Journal* recommends as a lute for covering the corks of vessels containing benzine or any of the light hydrocarbons or essential oils, a paste made of finely-ground litharge and concentrated glycerine. The mixture is spread over the corks or bungs, and soon hardens. It is insoluble in the said liquids, is not acted upon by them, and is quite inexpensive, as the commonest kind of glycerine can be used.

Railroad Progress.

NORTHERN PACIFIC.—The telegraph has informed us the past week that Jay Cooke has nearly completed arrangements for selling the bonds of the Northern Pacific Railroad, and contracting for its immediate construction. Surveying parties will go to work immediately. The early construction of this road must be considered certain—there may be a delay of a few years, but *only* for a few years. Judging from the character of the parties who now have it in hand, there can be no very long delay.

SOUTHERN PACIFIC.—Several parties who were originally connected with the Northern Pacific, are now devoting their energies to the Southern Pacific. A European loan of ten millions for the commencement of operations is confidently expected at an early day. The routes of both these roads have near both termini rich districts of country which are being rapidly filled up and developed. Both will be needed before it will be possible to complete them, even with a plenty of money in the hands of their projectors.

THE CENTRAL PACIFIC Co. are pushing on their improvements and branches. The California Pacific are hardly less active. The Virginia and Truckee are straining every nerve to complete the road by October. All these enterprises will be immediately profitable, and it would have been a most unfortunate occurrence for California had they been delayed.

THE VACA VALLEY ROAD.—The last rail on this road was laid on Tuesday last, and it is now open for business.

STOCKTON.—Two more meetings have been held in Stockton, to devise measures and means for the construction of the proposed railroad southwards from that city. At the second meeting a report of progress was read which appears to have given much satisfaction.

THE SAUCELITO RAILROAD.—The report that the work had been suspended on the railroad terminating at Saucelito, and that the enterprise had been given up, is authoritatively denied by the Directors. Work was suspended on a portion of the road which was being built by a person employed by the company, without authority. About fifteen miles of road has been graded and is ready for the iron, and the President of the road is on the way to the East to purchase iron. It is asserted that the road will be built at an early day.

RAILROAD FROM MARYSVILLE TO COLUSA. Marysville has already become directly connected with the California Central, and will soon have a tide-water connection at Vallejo. She is also vigorously pushing on the rail northward for a connection with Oregon. Not content with all these advantages, she has already set the ball in motion for still another connection—with Colusa, an agricultural town, about thirty miles west of the Sacramento. The *Appeal*, in urging the construction of this road, says: "The people of Colusa want the most direct communication with the great thoroughfare of travel and commerce East as well as West, and this desirable object can be obtained by building a railroad to this city, and here connecting with the California and Oregon line as well as the Vallejo. There is a great market for grain, farmers' produce and fruit over the mountains, and if a railroad is built from Colusa to Marysville, direct daily communication can be had with the Central Pacific, going over the mountains, and the Vallejo Railroad, running directly to San Francisco. Some public action should be had immediately to this end. The counties of Sutter, Colusa and Yuba should contribute liberally toward this enterprise. Capitalists and railroad men should examine this route. It would prove a very profitable railroad investment." There is no better field for a short railroad in California than the one here suggested.

SUSCOL TO HEALDSBURG.—The railroad from Suscol to Healdsburg, by way of Sonoma and Santa Rosa, has been mortgaged to a couple of gentlemen of San Francisco representing a large amount of capital, and the amount of stamps on the mortgage—$3,500—seem to indicate an intention to do some work.

San Francisco:
Saturday Morning, June 19, 1869.

Trial of Giant Powder in the Gravel Deposits.

At Sebastopol, on the ancient channel of the Middle Yuba, there was tried week before last, a charge of Giant powder in gravel. A tunnel of thirty-five feet was run into the deposit, then a cross drift or chamber was opened of 20 feet in length by 2x3½ feet. One long thin cartridge was made of the Giant powder lengthwise of the latter space; the mouth of the entrance tunnel was then dammed up, in such a manner as to flood the passages, and water was let in by means of the hose, serving in the place of the usual closing and tamping; communication with the Giant powder having been secured by the placing of water fuse. The quantity of Giant powder used was 175 pounds. The fuse being ignited, it burned successfully to the percussion cartridge and the Giant powder was exploded, but without throwing down or disintegrating the bank. It appeared that the Giant powder operated very suddenly; owing to that or some other cause the effect of the explosion was mainly upon the water, which was blown out of the hole and spattered over the claim with tremendnous force. Whether the results in gravel could be bettered by a different method of tamping, remains to be developed by further experiment. A few seams were of course opened, but not to the degree of assisting in the operations of the hose, for the ground, says our informant, "wouldn't pipe." Forty kegs of common blasting powder were then put into the chamber, inclosed by tamping, and exploded with satisfactory results.

WHITE PINE POST OFFICES.—We are informed that subscribers for newspapers at the principal towns in White Pine, Nevada, are complaining loudly of the post office arrangements there. Papers are not delivered regularly—in fact, are not delivered at all; but thrown into superannuated dry goods boxes or placed in a position calculated to tempt the "boys" to take their choice. This is getting to be a serious matter between ourselves and subscribers, and we respectfully call on our White Pine exchanges to investigate and inform us if "such conducts as those" are likely to continue indefinitely.

THE San José *Mercury*, one of our best interior exchanges, and among the oldest journals in the State, has entered upon its 17th volume. May it live to see a hundred years and more. The proprietors announce the early establishment of a daily.

The New Rivot Steam Roasting Process.

A visit to the "French mill," in the pines above Nevada City, made by us on Friday of last week, for the purpose of satisfying ourself concerning the results of the new Rivot roasting process by the use of decomposed water, disclosed a fine establishment, admirably gotten up with all the requisites for intelligent working, provided only that the great cylinder shall do its duty. The key to the building, unexpectedly to us, was found in the hands of a sheriff's deputy, (who was soundly sleeping, the weather being warm), and all in the neighborhood was rurally quiet. Birds sang around the doors of a comfortable *hutt-house*, where were visible untold dozens of inverted claret bottles, gloaming in their own green blaze of sunshine; while esthetics and embodied suavity were at home in cool shade within. French metallurgy is never less than a success, but the processes incidental thereto are often unconscionably stubborn. From behind a pouderous volume (Racine or Lavoisier?) there met us a classic, middle-aged, amiable face, in lines of gentle repose—the last of the spirits of the French mill, an humble worker—the rest of the ingenious number having all returned to France, and gone we know not whither, even before the famous cylinder begins to rust; not to consult Rivot this time, for he is dead. When Poetry takes a diverging path, leaving French metallurgy in the lurch, what becomes of it and of all the assistant metallurgists?

It seems, withal, that the new Rivot roasting process with steam was not a failure by any means when undertaken in a small way. Chemically, Rivot's idea of roasting with steam alone, under perfect exclusion of air, the ordinary agent of roasting, and, in point of fact, practicable. Instead of using oxygen of the air to convert FeS^2 into Fe^2O^1 and SO^2, the Rivot process vaporizes and decomposes water into its elements by contact with the glowing ore; then by continued exposure and mixture of the latter with the inclosed gases, H and O, in the ore-tossing cylinder, effects an interchanging of elements thus: $FeS^2+HO=Fe\cdot O^1+HS$; the latter gas being easily discernible by its remiuding of things somewhat worse than infernal.

This undertaking, under the immediate auspices of Rivot, who was to have visited this country for the purpose of devoting his personal attention to the matter, was an attempt to make out of a laboratory process a working process, in order to save fuel, the chief cost of roasting. It would be premature to decide against it conclusively at present, however, from this standstill, since greater experience or further trial may yet succeed. Prof. Rivot's death certainly is a loss to California.

There is little to describe in the French mill besides its great cast iron cylinder; there being in place two fine steam engines, five or six large amalgamating pans, a number of settlers, and, in a side department, the entire apparatus, duplicated, on a small scale, with assaying appointments. The cylinder is set in a brick furnace, weighs 21,600 pounds, measures fourteen feet in length and five feet in diameter, resting on wheels, on which it is rolled around by the agency of a tangent screw on top. It is charged with a ton of ore. The flames of a wood fire pass over the cylinder, heating it to a low red heat, and down on the other side, where they pass under the steam generator. The gases from the cylinder are led out from the end opposite to that where steam is first brought in contact with the ore.

That the trials of the past month have not been successful in the estimation of those who were in charge or interested, appears evident; we have not been able to learn the precise cause. Probably the roasting was found to require too much time, and the fuel, after all, was too costly, as compared with ordinary roasting. Years ago Mr. John Scott roasted pyrites in this manner, requiring ten hours to desulphurize and oxydize 500 pounds. A statement of the times required to roast different charges, and the results in general, from some of the late metallurgists of the French mill, would surely be worthy of record, for comparison with the ordinary air roasting. We surmise, further, that the roasting was done in part only to the stage of sulphate, since that is all that a low red heat would effect; while a light red, or white heat, such as is requisite for perfect amalgamation or chlorination, would have destroyed the cylinder.

What was known several years ago as the "Rivot process," was an attempt to accomplish similar results chemically with a different tool,—the reverberatory furnace,—into which steam was injected from above; but it was not successful, owing, as is stated, to the impossibility of excluding air in the stirring that was found necessary. Another attempt of the kind, with still another tool,—the kiln furnace,—is the Hagan process, of which we hear occasionally, but nothing of late.

Giant Powder and Sickness.

The gases from exploded Giant powder appear to operate very differently upon different individuals. Many experience headaches at first, but afterwards get accustomed to it. Others do not experience any ill effects from it whatever. We learn, however, from what appears to us to be an unprejudiced source, that some good and healthy men have been debarred from laboring in the mines where it is employed by reason of its extremely sickening influence upon them; causing headaches, nausea, and, on persisting in trying to get used to it, a wasting of the flesh and a ghastly complexion. At Grass Valley some miners thus affected quit work very involuntarily some time before the strikers were under way.

Recognizing the difficulty of introducing any new and meritorious invention, it is well for the mining public that the giant powder has succeeded in obtaining so thorough a trial; and we apprehend that its advantages will not be lost in the end by reason of its injuriousness to health. Better ventilation, or air-blasts, as at Smartsville, would render it tolerable, perhaps even to those who are most affected. From the laboring miner's stand-point it must be conceded that the question involving loss or change of occupation and home at once, is not a trifling one. Fair play, and moderate pressure, will work best on all sides just now.

Cope Mining District.

Col. Drew has left with us some rich specimens of antimonial silver ore from the new district discovered by him and his prospecting party, 65 miles northeast of Elko, situated 5,750 feet above the sea, and in sight of the region of the Poorman, War Eagle and Oro Fino mines, of Idaho. This new district has already drawn towards it all of Elko's loose saddles, horses, including even stages it is said, by that loadstone attraction which mineralized silver has been observed to exert upon such articles, together with quite a few men who could spare the time and who were willing to go and discover a fortune where such things do grow. The minerals are pyrargyrite, or dark red antimonial silver, chiefly; and stephanite or rhombic brittle silver, in quartz; with flakes of chrysocolla, or "silicious malachite."

The Argenta claim, one of the four locations made, is but a quarter of a mile from the North Fork of the Owyhee river. This ledge is the widest—being six feet in width; but all the ledges are remarkably clear and well defined.

Single and Double-Handed Drilling.

It is alleged, on good grounds, that the principal reason why many of the Cornish miners at Grass Valley object to the employment of the Giant powder is because they do not wish to work with the single-handed drill. The statement, however, without a word of explanation for such aversion, will, to many, look trivial. What is the difference between single and double-handed drilling?

Suppose that the ordinary powder be used. It is true, in the first place, that with the double-handed drill (a holder and two strikers), there is apt to be more talking, and smoking, and idleness, while the work being done is easier. When the same man both holds and strikes, the exertion intrinsically necessary is considerably increased.

The use of the two systems in Cornwall is geographically bounded. A Cornishman will inquire in regard to a new-comer underground: "Is he an Eastern man, or a Western man?" If Eastern, the man knows only the use of the double-handed drill, and will shake his head,—with all the wisdom of a practical miner,—at the entire single-handed system and its aiders and abettors. If he be a Western man, it may be concluded that he is both left handed and right handed in the twinkling of an eye; that he will upon occasion insinuate himself into a hole or crack only a few inches larger than his body, and pointing his drill ahead of him, will swing his hammer rapidly just underneath his beard, right handed or left handed by turns, with a genuine miner's skill. St. Just is the representative of the single-handed system, and the St. Just tin mines are, Mr. Phillips informs us, the cheapest worked mines in the world.

There is a custom in Cornwall touching this single-handed and double-handed drill business, the mere statement of which illustrates the merits of the two systems, and at the same time suggests curious comment upon the laws of wages and labor in Europe, where the lines under the same as shaped to-day are very distinctly drawn. An agent, in letting his contract at so much per fathom, calculates that the miner, whether he work with the single or the double-handed drill, shall be allowed to earn only about $100 per month. It has grown into custom, therefore, to pay him 20 per cent. less per fathom for single-handed drilling than for double-handed; the calculation being that at the end of the month the miner will have made it up. Where $100 would be allowed per fathom for double-handed work, only $80 would be counted upon being given for the same single handed. In other words, the latter, where it can be used, is 20 per cent. more effective and more economical to the mine owner. To see that the latter profits wholly by it, is the agent's look-out, and he is held responsible. No wonder that an "Eastern man" with a bit of native ignorance should be somewhat prejudiced against single-handed drilling.

For shafts, and sinking generally, the double-handed drill with common powder is undoubtedly the best. Rapid progress, under efficient blows and large blasts, render it advantageous. But in ends, overhead work, stopes, or narrow places, even with common powder the single-handed drill is more effective and economical. The "Eastern man," and the intelligent mining superintendent who swears by him, are, in fact, a little behind the age, since all the world outside of the view from Carnbrea, has been using the single-handed drill for, we know not how long. The latter measures about ⅞ of an inch; the double drill from 1¼ to 1½ inches.

RUSSIAN BATHS.—The opening exhibition of the new Russian Steam, Turkish and Roman Bath House, at No. 528 Pacific street, by Dr. F. Zeile, will take place at two o'clock this P. M.—open from two until eight P. M.

Placer Sulphurets.

Different opinions prevail regarding the quantity of gold contained in the iron pyrites of the deep placers; but those who have taken pains to find out, and who have considerable interest therein, declare that the hydraulic mining sulphurets are nearly barren, and will not pay for saving. Fire assays, mill workings after roasting, and chlorination tests alike, are said to give this general result. But other cases are known to us where gold has been found, in very fair quantity, in precisely that kind of sulphuret which is pronounced to be barren—the formations in old trees; and we are told by others that in spots the ancient river pyrites are more richly auriferous than they are in others.

A slovenly fire assay is not a sufficient test for the existence of paying quantities of gold in scattered iron pyrites. The assayer must concentrate his product, and avail himself of repeated scorifications; but it is better still to chlorinate, on a considerable scale.

Much of the river sulphuret crystallizes in the rhombic or trimetric system, the result bearing the name of markasite, for distinction; but the monometric and the trimetric pyrites frequently occur together, and are chemically the same—Fe S^2. Mr. Maltman, of the chlorination works at Nevada City, thinks that the ancient river pyrites are all markasite, and that they do not contain any gold in economical quantities. A variety of markasite which is softer (H. 3 to 4, instead of 6) and lighter (G. 3·5, instead of 4·6), and which contains chemically bonnd water, is called water pyrites, by Breithaupt.

Wurtz has brought to attention the fact that sulphate of iron and chloride of iron, substances common in subterraneously circulating waters, dissolve gold at low temperatures, the latter doing it very freely. It is possible that the watery sulphate of iron, with its gold, in changing to a sulphide by accession of sulphur from organic sources or other reaction, and becoming insoluble or precipitating, would not inclose so much of the precious metal in markasite, as in the monometric sulphuret.

We know that the hydraulic mining sulphurets and tailings do retain large percentages of gold, whether it be free, or rusty, or in mercury; touching here upon a purely theoretical question, yet which, none will deny, is also of practical importance.

Black Silver Sulphurets Replaced by Red Silver and Iron Sulphurets.—The constant changing and relocation of metals in the bowels of the earth through the agency of acid or alkaline waters, is exemplified by the existence of pseudomorphs of other minerals after silver-glance—the soft black sulphuret of silver, the choicest and most especial ore of that metal. At Braod, near Freiberg, there have been found recently (and can yet be obtained) replacements or pseudomorphs of red antimonial silver, and of iron pyrites, in the ground, and mask, so to speak, of silver-glance; the former, baser ores, having assumed the crystallization form of the latter,—a silent but unmistakable record of the former existence of black silver, where only the sulpburet of iron and pyrargyrite are found by the miner.

There have been over 100 applications for space at the Mechanics' Institute Fair, most of them from residents outside of San Francisco—from Oregon, Nevada, Sandwich Islands, etc. To prevent the dissatisfaction that followed the announcements of the committees last year, the Board of Managers have determined to appoint all the committees before the opening of the Fair; but, to prevent exhibitors from attempting to influence the decision of the judges, their names will be kept secret until after they have made their report of awards.

Inventions and Patents.

New Patents Issued to Pacific Coast Inventors.

From official reports to DEWEY & CO., United States and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.
Copies of any U. S. Patent Claims furnished immediately at small cost. Full copies of American or Foreign Patent Claims can be obtained by telegraph or mail through this office.

For the Week Ending June 1st.

Reducing Sulphur Ore.—Charles W. Moore, San Francisco, Cal.—90,677.

I claim the use of black oxide of manganese, burnt lime, and charcoal, in combination or together, as a desulphurizer, substantially in the proportion and manner, and for the purposes specified.

Carriage Wheel.—Eldridge G. Woodside, San Francisco, Cal.—90,714.

I claim the elastic packing-rings B, with their projections *c* and recesses *g*, and with or without shoulders, *b b*, *f*, applied to the ends of the box C, in combination with the hub A, the ends of the interior of which are of a form corresponding to that of the rings B, substantially as and for the purpose described.

This invention is simply an addition to or improvement in a patent held by Mr. Woodsides, of which an extended notice has already been given in the Press, and consists in a broader and more general application of the rubber or plastic packing rings, so as to embrace their use when applied to wooden hubs, boxes, etc.

Electro-Maonetic Amalgamator for Gold and Silver.—Almarin B. Paul, San Francisco, Cal.—90,777.

I claim 1. The construction of the horizontal rotating hollow-axled glass or earthen cylinder A, for the purpose of amalgamating and separating metals, whether precious or base.

2. The introduction of electricity, through hollow axles, or trunnions, into glass or earthen barrels, for the purpose of preparing ores for amalgamation, and for separating metals.

3. The introduction of magnets into glass or earthen barrels, for the purpose of acting magnetically upon ores during separation and amalgamation.

4. The amalgamation of pulverized ore, in a dry or wet condition, with mercury, in glass or earthen barrels, or cylinders.

Burglar Alarm.—Henry Bergstein, San Francisco, Cal.—90,809.

I claim, 1. The lever A, spring *b'*, and wire D, when arranged as described, in relation to a window-sash, and combined with the alarm device I H' *h1 h3*, in the manner described, and for the purpose set forth.

2. The band-slide M, signal-board L, wire *k*, and lever K, when combined and arranged with each other, and with the alarm device I H' *h1 h3*, as described, for the purpose set forth.

Washing Machine.—Frank Buckelew, San Rafael, Cal.—90,817.

I claim constructing the tub with the supporting-cleat D, and with inclined sides A B, against which the fabric strikes as the wheel is turned, with the radial arms G, provided with openings G', to which the fabric to be washed is attached, as set forth and shown, for the purpose specified.

Hoisting Apparatus.—Lewis Cutting, San Francisco, Cal.—90,823.

I claim, 1. The brake-bar I, provided with the angular shoulders K, in combination with the brake D, horizontal brake M, and connecting-rod F, the whole constructed and arranged to operate substantially as described.

2. The slotted link L, for connecting the brake-bar and horizontal brake, as described, and the pin P, for arresting the downward movement of the brake-bar, substantially as set forth.

Gang Plow.—Corydon A. Fargo, Soquel, Cal., assignor to himself and Barber Darling.—90,831.

I claim, 1. The bent plates D D, attached to the outer frame, as described, the vertical set-screws D' D', which bear upon the said plates, for raising or lowering the plow-beams, substantially as set forth.

2. The vertical ways E E, friction rollers E' E', operating in the said ways, and the transverse bar F, to which the rollers are connected, substantially as and for the purpose set forth.

3. Connecting the two crank-axles H H by the rod K', so that both of the said axles may be operated by the upright levers L L', substantially as and for the purpose specified.

4. The set-screws J J, operating in the beams of the plow-frame, and linked to the arms 1.1 of the axles, in combination with the said axles, as and for the purpose set forth.

5. In combination with the levers L L', operating in the double rack M, the pawls R R, for unshipping, or releasing the levers alternately from the notches P', substantially as and for the purpose specified.

6. The front-end cross-beam of the outer frame, for attachment of the neap, or pole, axle, and crank axle, of the driving wheels, in combination with the crank-axle S', and semi-circular rack U, the whole constructed and arranged to operate substantially as specified.

Grain Separator.—Andrew Hunter, San Francisco, Cal.—90,844.

I claim, 1. The formation of the chuts B and C, with screen W W, and perforated plates Y Y Y Y, and inclining as shown in fig. 1, substantially as described, and for the uses and purposes as hereinbefore set forth.

2. The combination, with the grain-separating chutes, of the mechanism substantially such as herein described, for imparting a horizontal vibratory, or both horizontal and vertical vibratory movement to the same, in the manner and for the purposes set forth.

3. The combination of cross-bars N N with chutes B C, set-screws O and M, and pulleys X X, substantially as described, and for the uses and purposes hereinbefore set forth,

4. The combination of hopper E, feed-board I, feed-roller F, eccentric-roller H, substantially as described, and for the uses and purposes hereinbefore set forth, said combination of hopper, feed-board, and rollers to be attached to any machine for similar uses.

Wagon Spring.—Edmond P. McCarthy, San Francisco, Cal., assignor to himself and John Graot.—90,861.

I claim the bolt E, constructed with the head J H,' as described, so as to countersink above and below it in the cushion, or spring, substantially as specified.

Device for Holding Horses Attached to Carriages.—Augustus Moore and John Aylword, Mission of San José, Cal.—90,865.

We claim the ring C, to which is attached the strap H, when used in connection with bent arm G, and combined with connecting-rod E and T-shaped bar E', as described, for the purpose set forth.

DESIGNS.

Blackboard Brush.—Daniel Carpenter, San Francisco, Cal.—3,512.

This is an improved brush or rubber for removing chalk marks from blackboards, and consists in making the back of the brush of leather or other flexible material. The rubbing surface can be either sheepskin with a thin coating of wool, or plush, between which and the back is stuffed wool, hair or other elastic substance, thus making a perfectly flexible brush which will not accumulate chalk dust, and will be comparatively noiseless when dropped on the floor—a requisite, especially when employed in school rooms. It also prevents mutilating the blackboard, on account of its elasticity.

For the Week Ending June 8th.

Grain-Separator and Mixer.—James J. Crowley, San Francisco, Cal.—90,932.

I claim, 1. The device for regulating the feed, consisting of the hinged bottom *a*, the lug *b*, and plate *c*, operated by the screw *d*, substantially as herein described.

2. The oscillating frame K, with the screens D, F, G, and I, and the discharge-trough E and J, for separating and conveying the different classes, substantially as herein described.

3. The mixing-cylinder H, with its stirrer P and the overflow-trough *h*, substantially as and for the purpose described.

4. In combination with the mixing-cylinder, the tank R, with its adjustable gate S, for supplying the solution, substantially as described.

5. The vertically-shaking screen W, with its operating-cam Y, for partially drying the grain and discharging it, substantially as herein described.

This invention relates to a machine by which the different grains, but more especially wheat, may be separated from other sorts, and also from mustard and all other small seeds, so that a pure and unadulterated grain may be obtained for seeding purposes, and that only the largest and best shall be retained for that purpose. It also consists in providing a mixer by which a solution of sulpbate of copper or bluestone is thoroughly incorporated with the cleaned grain, and it is ready to be sown with less than half the expense and time ordinarily devoted to it.

Process of Collecting Gold and Silver from Ores.—August F. W. Partz, Oakland, Cal.—90,955.

I claim, 1. Placing the positive electrode at the bottom of the vessel containing the ore-pulp, and imparting to the said vessel and electrode a swinging or shaking motion, which will cause the heavier particles of the ore to settle, and thus be brought and kept in contact with the said electrode, substantially in the manner and for the purpose herein specified.

2. The use of metallic tubes as negative electrodes, substantially as described.

Device for Turning Saw-Logs.—Warren Richardson, Colfax, Cal.—90,959.

I claim the blocks B B, sliding vertically in mortises, and having bevelled tops, in combination with the eccentrics I I and shaft C, the whole being constructed and arranged substantially as and for the purpose set forth.

This invention relates to a new and improved device for canting saw logs after they have been faced by the saw on one side, and require to be turned so that the remaining sides may also be faced, and in fact it is used to slide the log or stick being sawed to its place on the carriage at any stage of the sawing, when care is to prevent splitting or injury to the edges or corners of the stick.

Composition for Destroying Ants.—John Douavan Dennis, Gilroy, Cal.—91,094.

I claim the use of the above mentioned composition of crystallized corrosive sublimats, pulverized red Cayenne pepper, and pulverized gum camphor, in about the above mentioned proportions, for the purpose of perfectly and effectually poisoning, killing and banishing ants, preventing their harboring, dwelling or remaining in or about the houses, cupboards and pantries, or any other places or articles whatever.

Machine for Cleaning Oats.—William D. Freeman, Tomales, Cal.—91,110.

I claim a riddle, as shown and described, and to be used as an oats-cleaner, and its operation in threshers and separators, for the purposes specified.

Steam-Packing.—A. H. Hall and H. T. Lee, Marysville, Cal.—91,120.

We claim the construction of the malleable metal strips, substantially as described and for the purpose set forth.

Machine for Polishing Shirt-Bosoms.—John J. Kenna, San Francisco, Cal.—91,138.

I claim the roll A, provided with the recess B, substantially as and for the purpose set forth.

A new map of Treasure Hill is about to be issued by W. H. Hall, C. E.

New Inventions.

A female mechanic at Springfield, Mass., has invented a new sewing machine, for which wonderful merits are claimed.

Improved Champagne Bottle.—An attachment to a champagne bottle, patented in England, permits a part of the contents to be withdrawn without in the least injuring the rest.

Pulverized Vine Roots.—A party in France has patented a method of "Utilizing pulverized vine-roots as food for cattle and apparatus for grinding the same.

Aerostatics.—De Louvre, of Paris, France, has patented an apparatus whereby he claims aërial navigation can be accomplished without balloons.

New Iron Process.—A process has been invented in Michigan by which it is claimed Marquette ore can be converted into malleable iron in forty minutes.

New Silk Reel.—Mr. Joseph Newman, the pioneer silk manufacturer in this city, has made application for a patent for a machine for reeling, of a novel construction. The plan now in general use for reeling is to have a brick stove to heat the water required to dissolve the gum in the cocoons. Mr. Newman has a small sheet-iron stove on the floor under the reel, with copper pipes leading to the hot water baths, where the cocoons are wet and reeled while in the hot water. He is now using one of these machines at his rooms on Commercial street.

New Motive Power.—A New York engineer has proposed a novel idea for the utilization of "wave power." He builds a dyke against which the waves may dash with all their fury, and roll up as high as their impetus will carry them; but when they go back it must be by a circuitous canal route, over a water wheel. The waves are thus made to fill a pond, which is drawn off leisurely. This is an improvement on the well-known tide-mill practice. The impetus of the waves or breakers takes the water to a higher elevation than a smoothly flowing tide.

Favorable for Inventors.

As may be seen by the increased list of patents issued for the past few weeks, the business of the patent office is being expedited, and examinations may hereafter be expected more promptly on applications made. We are now obtaining many of the patents for Pacific Coast inventors in one-half the time formerly required.

Twenty-Eight Years' Litigation.—The "hook-headed spike" patent case—commenced in 1841 by Henry Burden, proprietor of the Troy Iron and Nail Factory, to recover damages of Corning & Winslow, proprietors of the Albany Iron Works, of Troy, for the infringement of Mr. Burden's patent upon the machine for the manufacture of railroad spikes—has at length been finally adjudicated. The complainant was awarded about $80,000, and $50,000 costs. The patent right expired long ago.

Patents to Foreigners.—Applications for patents in the United States from inventors in European countries are increasing rapidly in number.

Lander Hill.

During the years 1867 and 1868, there were reduced by Mr. Curtis at the Manhattan mill, Austin, nearly 9,000 tons of ore, chiefly from Lander Hill, which produced about $2,000,000, averaging as follows:

1867.	*Average.*	1868.	*Average.*
January	$101 04	January	$182 63
February	190 90	February	188 54
March	166 15	March	184 36
April	212 29	April	212 48
May	111 24	May	200 95
June	107 96	June	229 76
July	126 64	July	220 82
August	204 83	August	316 95
September	214 87	September	266 26
October	236 89	October	173 02
November	206 23	November	266 73
December	187 42	December	165 87

All under $80 per ton is thrown on the dump, as worthless under present circumstances.

Many a new company has been successful, recently, in "raising the wind" on less than $80 ore, without a vein.

Continental Life Insurance Company, 203 Montgomery street, corner of Pine.

Coal will be King.

We clip the following from an article in the *U. S. Railroad and Mining Register:*

"China and the United States have almost a monopoly of the world's coal. The immensely productive fields of England are small and must soon be exhausted. We say soon; we mean, in two or three centuries; for what is that to the thousands of years in which mankind has inhabited the planet, and will continue to inhabit it? The British annual coal trade has reached one hundred millions of tons. That part of the Pittsburg coal-bed which lies within the Pennsylvania State lines alone will bear the extraction of a hundred millions of tons per annum, for 2,000 years. The calculation has been carefully made. There is as much more in those parts of the bed which extend into Ohio, Virginia and Kentucky; and four times as much more, in the beds which underlie it. So much for the Appalachian coal field merely. The Illinois, the Michigan, the Iowa and North Missouri, the Kansas coal-fields will each of them compare with it in extent, although not in depth of measures, number of beds, and quality of fuel. And recent explorations have shown extensive fields of Cretaceous and Tertiary coals in the interior of the continent.

China seems to have equally numerous, equally large, and various coal fields. Every one of her sixteen provinces or kingdoms supplies itself with mineral fuel from its own mines. Let the steam engine once fairly settle and breed in Kiang-su, or Chen-Kiang, or Fuh-kien, or Kwang-tung, and we shall see what we shall see. The west will find it hard to hold its own. Destiny may exact a century or two of leisure to finish up the job; but when it is done, the History of Mankind will wear a new face. England will have retired up the left, and the stage will be occupied by the three principal *dramatis personæ*, China, Russia and the United States; all the present kingdoms of Christendom, poorly supplied with coal, remaining mere supernumaries."

How to Recognize Good Meat.—Dr. Letheby says: "It is neither of a pale pink, nor deep purple tint. It has a marbled appearance from the ramifications of little veins of fat among the muscles. It should be firm and elastic to the touch, and should scarcely moisten the fingers—bad meat being wet and sodden and flabby, with the fat looking like jelly or wet parchment. It should have little or no odor; diseased meat has a sickly, cadaverous smell, when the meat is chopped up and drenched with warm water. It should not shrink or waste much in cookiug. It should not run to water or become very wet on standing a day or so, bnt should, on the contrary, dry on the surface. When meat is dried at a temperature of 212° or thereabouts, it should not lose more than from 70 to 74 per cent. of its weight, whereas bad meat will often lose as much as 80 per cent."

Thickness of Gold Leaf.—Fifty years ago a workman reqnired 18 or 19 dwts. of gold to make 2,000 leaves; now only 14 or 15 dwts. is required. The thickness of each leaf is ahout one 280,000th of an inch. It would take 120 of these sheets to make one as thick as a sheet of ordinary printing paper.

The Compressed Drill is being introduced into the Lake Superior mines. The *Miner* says that a gentleman connected with the Phœnix mine, Eagle river, has recently procured one of these drills, which he proposes to subject to a thorough test. Much is claimed for this drill in cheapening the cost of drilling in mines, aud the *Miner* promises to note and report results.

Sale of Idaho Mines.—A letter from Placerville, I. T., June 3d, says: "The claims owned hy Langurie, Larkiu, Shelly & Mills, on Giant Creek, have been bargained for $40,000. The Barnard claim, adjoining, has also been sold for $45,000.

To Clean very Dirty Brass.—Rub some bichromate of potassa fine in a mortar; pour over it about twice its hulk of sulphuric acid, and mix this with an equal quantity of water. With this mixture, the dirtiest brass is cleaned in a trice. Wash immediately in plenty of water, wipe it, and rub perfectly dry, and polish with powdered rotten-stone.

A large portion of the estate of the late Baron Rothschilds was invested in United States bonds.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,

SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continuat working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodcuff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.

San Francisco, May 1, 1868. 18v16tf

CALIFORNIA BRASS FOUNDRY.

No. 125 First street, opposite Minna,

SAN FRANCISCO.

All kinds of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, turnished with dispatch.

☞ PRICES MODERATE. ☜

J. P. GALLAGHER. J. H. WEED V. KINOWELL.

9v13-1y

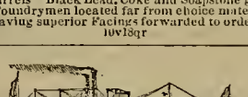
FOUNDRY FACINGS.

BENJAMIN ELLIOT,

No. 483 Brannan street.....San Francisco,

Manufactures Foundry Facings constantly, from choice coals. Bituminous, packed in tight sacks. Anthracite and Charcoal ground together or separate, packed in whole or half barrels Black Lead, Coke and Soapstone ground to order. Foundrymen located far from choice material, can rely on having superior Facings forwarded to order.

10v13qr



JAMES MACKEN,

COPPERSMITH,

226 Fremont st., bet. Howard & Folsom.

All kinds of COPPER WORK done to order in the best manner. Particular attention paid to Steamboat, Sugar House and Distillery work.

Repairing promptly and neatly attended to.

13v11

THOMPSON BROTHERS,

EUREKA FOUNDRY,

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

Power for Sewing Machines.

When the sewing machine was brought into general use, it was received as a great boon to womankind, on the supposition that it would greatly relieve and lighten her labor. But now it seems that a new invention is needed to lighten the labor upon the machine, which is working terrible havoc upon the health of those who are compelled to operate it with anything like continued work, especially such as is required in factories. Dr. Dio Lewis, a most reliable authority, says somewhat bluntly of girls so employed: "If they rnn a sewing machine they last from one and a half to two years, though some few stand it longer. Their backs give out, their spines give way. It is that ugly movement of the foot that spoils the spine."

Such an opinion needs no comment. The experience of every family where a ewing machine is operated a large portion of the time by any one person, is sufficient to condemn the use of this useful machine by the foot power of delicate women. Many devices have been put forward to remedy the evil. A Frenchman has recently invented a magnetic engine; but tho cost of operating such a machine must effectually prevent its coming into general use. Compressed air and water engines have been tried; but neither seems to meet with auy considerable degree of success. An arrangement of clock work was exhibited in this city a few years ago, but it cost about as much as the machine. Coiled springs of sufficient power occupy a large amount of room, and are very expensive.

What appears to be a most excellent device, is a series of peculiarly constructed elliptic springs, with a fusee attachment, for regulating the power derived from the same, the invention of Mr. Jacob Zuckerman, of this city. We understaud that the inventor has refused au offer of $50,000 for the same. This invention was patented through the Mining and Scientifio Press Patent Agency. Mr. Roger S. Day, of Folsom, Cal., has also secured protection through the agency conncctcd with this office, for an invention intended to accomplish the same object.

White Cloud, Nevada.

Mr. H. Bassett, Recorder of this new district, recently visited San Francisco and Santa Clara County, where he had ores from various lodes tested, much to his satisfaction. He returned to prosecute his work with renewed vigor. In a letter to the *Alta* he gives many interesting statements. A pure cold stream, containing about 250 inches of water, courses through tho cañon. Fifty-five ledges have been recorded. Two town sites have been located. The Moonta ledge carries a high per cent. of copper. The Poorman develops splendid looking silver ore. Wood, grass, water, health and ledges are abundant. We regret not having space to give Mr. B.'s letter in full.

Overland Fares.—Charges are being gradually reduced on the Pacific Railroad. The latest reduction, as per announcement on Thursday, was $173 in currency, from this city to New York, aud $153 to St. Louis or Chicago. The time to Chicago is 5 days, 7 hours; to New York, 7 days. The Chicago *Tribune* holds that the faro should be reduced to $60. As experieuce has proven that, withiu a reasonable limit, the profits of all railroads are iu proportion to the cheapness of their fares, we presume the Pacific road will continue to lower the rates from time to time, until the lowest paying rate is reached.

See illustration in our advertising columns of the automatic clothes washer and boiler, patented in 1864. The hot suds and steam, by the action of heat, are driven up through tubes, poured upon the clothes and forced through the fabric, cleansing them in the operation without labor or rubbing. ***

Company Transactions.

New Incorporations.

The following new companies have been incorporated:

MINING.

Frederika Silver M. Co.—June 12th. Capital stock, $800,000. Trustees: J. De la Montanya, L. J. Adams, G. H. Burnham, B. F. Swan and J. H. Pesinger.

HOMESTEADS, ETC.

Junction H. A.—June 10th. President, J. L. Blakie; Secretary, I. T. Milliken; Treasurer, J. C. Collins. Trustees: W. B. Cummings, J. W. Hoffschneider, A. Korbel and H. Epstein.

New Potrero H. A.—June 12th. Directors: Edward Barry, William Hollis, S. B. Goddard, John W. Nye, John Bell, J. T. McLean, George Hearst, R. J. Trumbull, C. S. Swinsou. John Bell, President, Edward Barry, Secretary.

Buena Vista H. A.—June 15th. Trustecs: George Cofran (President), C. W. M. Smith, N. Atkinson aud W. G. Doane. J. S. Luty, Secretary.

Oakland Prospect H. A.—June 16th. President, C. J. King; Vice President, J. L. Coggswell; Trustees: Amos Currier, N. P. Copp, H. L. Chamberlain, William Hollis and John Bays. Treasurer, Geo. R. Eckley; Secretary, J. F. Crosett.

Front Street, Mission and Ocean Railroad Co.—June 14th. Directors: N. D. Arnot, Henry Casebolt, Abner Doble, William Blackwood, D. N. Walter and Isaac Lankershim.

The grass ou the plains is becoming short, and stock is being sent to the mountaius.

Cast Iron Stoves.—M. Morin has demonstrated the escape of carbonic oxide from iron stoves heated to redness,—a fact urged by Messrs. Troost and Deville,—by direct analysis, both of the air of the room so heated, and of the blood of animals introduced into it. Such stoves should therefore be lined with brick or fire clay, so as to prevent the heating of the metal to redness.

Wonderful Invention!—To Housekeepers!

NEW METHOD OF

WASHING CLOTHES

WITHOUT LABOR.

JOHN REIST'S Celebrated Patent Automatic

CLOTHES WASHER AND BOILER.

This Boiler is most effectual, reliable, and universally recommended; and is the first SELF-ACTING, PORTABLE WASH BOILER, for household purposes ever made, and strange to say, has never been improved, as nearly all others, "which are infringements," have proved total failures. See decision U. S. Patent Office, November 1, 1868, for its wonderful operation and you cannot do without it. WM FRIEL, Agent for San Francisco,

25v1 3m 67 and 69 Fourth st., bet. Mission and Jessie sts.

Mining Notices.

French Silver Mining Company.—Location of Works: White Pine District, (formerly Lander County), State of Nevada.

Notice.—The Annual Meeting of the Stockholders of the Silver Sprout Mining Company will be held at the office of the Company, No. 408 California street, San Francisco, on TUESDAY, the twenty-ninth day of June, 1869, at 12 o'clock M., for the election of Trustees to serve for the cosuing year, and for the transaction of other business.

T. B. WINGARD, Secretary.

San Francisco, June 4, 1869. je5

The Press is one of the most valuable and instructive papers published in the United States, and every miner, millman, machinist and foundryman should be a subscriber. The information to be derived from its columns is worth many fold times the subscription.—*Grass Valley National.*

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
19v18 6m B. F. HOWLAND.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 21v18-4w

DR. HALL has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs. Curling, Druit, Lee, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Boeck, Sperino, and Dewitz. Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's. San Francisco. 21v18 3m

Pain Killer.—We beglleave to call the attention of the public to this long celebrated and unrivalled Family Medicine. The Pain Killer is a purely vegetable compound, and while it is a most efficient remedy for pain, it is a perfectly safe medicine even in the most unskillful hands. For Summer Complaint, or any other form of bowel disease in children or adults, it is an almost certain cure and has without doubt been more successful in curing the various kinds of Cholera than any other known remedy, or even the most skillful physician. In India, Africa and China, where this dreadful disease is even more or less prevalent, the Pain Killer is considered by the natives, as well as European residents in those climates, a sure remedy.

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

CARVALHO'S
Patent Steam Superheater

[SECTIONAL END VIEW OF BOILER, WITH SUPERHEATER.]

Save Fuel! Saves Water! Saves Pressure!

Brief Extracts from letters from parties using Carvalho's Superheater. Full letters can be seen on application:

NAVY YARD, Washington, June 15, 1860.

"Superheater saves 12 per cent. in fuel and 10 per cent. more in speed of engine."

NAVY YARD, Washington, Oct. 8, 1867 (after *seven* years of service.)

"Superheater yet attached to boilers, and appears to be in good order."

HOWARD WATCH AND CLOCK CO., Boston, May 19, 1866.

"Superheater saves us at least 10 per cent. in fuel and gives a large increase of power."

JONES & SMITH, New York, March 21, 1867.

"Superheater saves 20 per cent. of coal, less steam pressure, exhaust more serviceable in drying paper."

STEAM ENGINE WORKS, South Brooklyn, April 23, 1867.

"Superheater saves not less than 20 per cent. fuel; no priming!"

CAOCKETT LEATHER CLOTH CO., Newark, N. J., Oct 16, '67.

"Superheater economizes 25 per cent fuel; does our work with 25 lbs. less pressure steam, and steam superior for drying purposes."

N. Y DYEING & PRINTING ESTAB., Oct 4, 1867.

"Superheater brings contents of our dye vats to boiling point in one-third less time and one-third less increase of water; saves us at least 15 per cent. fuel."

CONTINUOUS OIL REFINING CO., Binghampton, N. Y., Sept. 20, 1867.

"Superheaters give entire satisfaction, and we superheat to 55 deg—an increase of 200 deg."

CARKW MANUF. CO, So. Hadley Falls, Mass., Oct. 17, '67.

"Superheater saves 15 or 20 per cent. fuel; steam for paper mill now perfectly pure and dry—an important advantage in our business."

STATEN ISLAND FANCY DYEING ESTAB., June 18, 1867.

"Superheater saves at least 25 per cent in fuel, and we have the advantage (hardly to be over-estimated) of perfectly dry steam."

ÆTNA IRON WORKS, San Francisco, Sept. 15, 1867.

"Superheater saves 25 to 30 per cent. in fuel; no priming"

CONTRA COSTA LAUNDRY, Oakland, July, 1868

"Superheater causes a use of 50 lbs. steam instead of 60 lbs.; use much less water, and there is a saving in fuel."

HAVILAH M. CO., Cal., August, 1868

"Superheater causes a use of 40 lbs. steam instead of 60 lbs.; use much less water, and there is a saving of fuel." (2 sets.)

SIXTH MECHANICS' INST FAIR, S. F. Sept 4, 1868.

"Superheater used proves that it saves fully 30 per cent. in fuel." (Chief Engineer.)

NEVADA MILL, Virginia City, May 30, 1869.

"Superheater is a perfect success, and saves two cords of wood in eight, or 25 per cent. in fuel; engine works better."

And many other letters of the same tenor.

Important to Assayers.
Crucibles.

The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucibles:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. A. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretotore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every not obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,

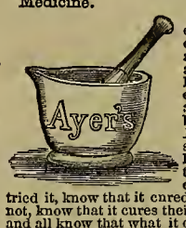
Ayer's Cathartic Pills,

For all the purposes of a Laxative Medicine.



Perhaps no one medicine is so universally required by everybody as a cathartic, nor was ever any before so universally adopted into use, in every country and among all classes, as this mild but efficient purgative *Pill*. The obvious reason is, that it is a more reliable and far more effectual remedy than any other. Those who have tried it, know that it cured them; those who have not, know that it cures their neighbors and friends, and all know that what it does once it does always—that it never fails through any fault or neglect of its composition. We have thousands upon thousands of certificates of their remarkable cures of the following complaints, but such cures are known in every neighborhood, and we need not publish them. Adapted to all ages and conditions in all climates; containing neither calomel or any deleterious drug, they may be taken with safety by anybody. Their sugar coating preserves them ever fresh and makes them pleasant to take, while being purely vegetable no harm can arise from their use in any quantity.

They operate by their powerful influence on the internal viscera to purify the blood and stimulate it into healthy action—remove the obstructions of the stomach, bowels, liver, and other organs of the body, restoring their irregular action to health, and by correcting, wherever they exist, such derangements as are the first origin of disease.

Minute directions are given in the wrapper on the box, for the following complaints, which these *Pills* rapidly cure:—

For **Dyspepsia** or **Indigestion, Listlessness, Languor** and **Loss of Appetite**, they should be taken moderately to stimulate the stomach and restore its healthy tone and action.

For **Liver Complaint** and its various symptoms, **Bilious Headache, Sick Headache, Jaundice** or **Green Sickness, Bilious Colic** and **Bilious Fevers**, they should be judiciously taken for each case, to correct the diseased action or remove the obstructions which cause it.

For **Dysentery** or **Diarrhœa**, but one mild dose is generally required.

For **Rheumatism, Gout, Gravel, Palpitation of the Heart, Pain in the Side, Back** and **Loins**, they should be continuously taken, as required, to change the diseased action of the system. With such change those complaints disappear.

For **Dropsy** and **Dropsical Swellings** they should be taken in large and frequent doses to produce the effect of a drastic purge.

For **Suppression** a large dose should be taken as it produces the desired effect by sympathy.

As a *Dinner Pill*, take one or two *Pills* to promote digestion and relieve the stomach.

An occasional dose stimulates the stomach and bowels into healthy action, restores the appetite, and invigorates the system. Hence it is often advantageous where no serious derangement exists. One who feels tolerably well, often finds that a dose of these *Pills* makes him feel decidedly better, from their cleansing and renovating effect on the digestive apparatus.

CCCCC VOLUME V. YALE.

The College Courant.

A New Volume commences with July. Now is the time to subscribe!

What is the College Courant?

It is NOT made up of a promiscuous mass of materials, a paper with its matter well classified and well arranged.

It is NOT a paper of interest merely to students, a paper containing matter of vital interest to every educated person

It is NOT a refuge basket for stale gleanings, the repository of the best thoughts of the ablest writers.

It is NOT a receptacle of prosy educational essays, a paper that has reached a strong manhood.

It is NOT a weak starving child, begging for support, a national college, scientific and literary paper.

It is NOT the organ of any sect, party, society or clique, 30 by 46 inches in size,—16 pages, beautiful in typography.

It is NOT a small sheet on poor paper, printed with old type, a paper well established and well sustained.

It is NOT a new, visionary enterprise, an experiment, a paper with the freshest news, and discussing live questions.

It is NOT a paper of interest merely to students, a journal with an Alumnus as publisher, and three as editors.

It is NOT a mere students' paper, without responsible publisher, a live *weekly*, fully up to the times.

It is NOT a heavy quarterly or a prosy monthly.

Perhaps we cannot give a better idea of the paper, than by enumerating a few of the

CONTRIBUTORS SINCE JULY 1, 1868.

President Woolsey, Yale, (four articles); President Chadbourne, Wis. Univ., (four articles); President Blanchard, Wheaton Coll., (three articles); Prof. J. Bascom, Williams, (four articles); Prof. J. D. Dana, Yale (six articles); Prof. E. R. Ruggles, Dartmouth, (two articles); Prof. E. D. Sanborn, Dartmouth, (two articles); O. M. Beard, M. D., (ten articles); Prof. J. M. Hoppin, Yale, (three articles); Prest. Wheeler, Baldwin Univ., (two articles); Hon. R. D. Smith, (ten articles); Prof. E. Kellogg, (two articles); Prest Barnard, Columbia Coll.; Prof Alex. Winchell, Univ. of Michigan; Prof. Noah Porter, Yale; Prest J. F. Tuttle, Wabash Coll.; Prof. W. F. Whitlock, O. Wesleyan Univ.; Prof. O. F. Lunny, Wheaton; Prof. Sanborn Tenney, Williams; Prof. H. N. Day; Prof. Enos Loomis, Yale; Prof. Chas. Martin, Hampden Sidney; Prof. Schele de Vere, Univ. of Va.; Prest Fairchild, Oberlin Coll.; Prof. Cyrus Northrop, Yale; Prof. W. S. Tyler, Amherst; Rev. L. Bacon, D.D.; Prof T. Dwight, Yale; Prof. D. C. Gilman, Yale; Prof. D. H. Wheeler, N. W. Univ.; Donald G. Mitchell, and scores of others.

THE COURANT, the coming year, will as far excel the past in value and interest, as the past has excelled any previous year. No College President, Professor, Alumnus, student or liberally educated person can afford to be without it.

THE SCIENTIFIC DEPARTMENT,

Edited by one of the Professors of Yale College, contains the most important scientific intelligence, most of which is translated for it from the leading French and German Scientific periodicals.

Its departments of College News, Personals, Gossip, Foreign Notes, etc., contain, in a condensed form, everything of importance concerning the colleges of this country and Europe.

A NEW
Gold Metal.

THE GOLD METAL WATCHES

Now being introduced by

C. E. COLLINS & CO.,

No. 629 Washington street,

SAN FRANCISCO,

Surpass anything yet made in the way of an Imitation Gold Watch. They wear well, and keep good time.

The Ladies' Watches cost $8 and $10 each.
The Gentlemen's cost $15 and $20 each.
Chains, from $3 to $6 each.

RECOMMENDATIONS:

SAN FRANCISCO, May 12, 1869.

This to certify, that I have carried one of the small size Gold Metal Watches which I got of C. E. Collins & Co., and I find that it runs as well, and keeps as good time, as any Watch I ever carried, and I can therefore recommend them. I am engaged on the Sacramento steamer "Chrysopolis." C. A. COLBY.

I am an engineer on the San Jose Railroad. I have been carrying one of C. E. Collins & Co's Watches for about one year, and I can safely say it is the *very best* watch for time that I have ever seen. GEO. CORNWALL,
Engineer on the San Jose Railroad.

MESSRS. C. E. COLLINS & CO:—Having heard your watches spoken of in the highest manner, I have resolved to order one for myself. You may send me one of the Lady's $10 Watches, without the chain. Send it as soon as possible, as I am very much in need of a time-piece.
R. B. PATTEN,
Toano, C. P. R. R.

The Public are cautioned against buying their watches at high prices, as many of them are sold for genuine *Gold Watches*, at from $100 to $150 each.

For List of Prices and Description of Goods send directly to us. Can be sent by Express, to be paid for on delivery.

C. E COLLINS & CO.,
No. 629 Washington street, San Francisco.

P. S.—Where six Watches of the above are ordered at one time, we will send one extra, free of all charge.

We also deal in the finest Gold and Silver Watches Watch Materials, etc. Send for circulars or prices.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

Blake's Patent.

THE BEST PUMP for Boiler Feeders, Breweries, Sugar Houses, Tanneries, Mining and Fire purposes, etc., is Blake's

Patent Steam PUMP

It is SIMPLE, COMPACT and POWERFUL, needs no expert to run it, and will start at any point. Is warranted to give satisfaction under all circumstances. Send for a circular. W. O. M. BERRY & CO., 114 California St., San Francisco, Cal.

GLASGOW
Iron and Metal Importing Company

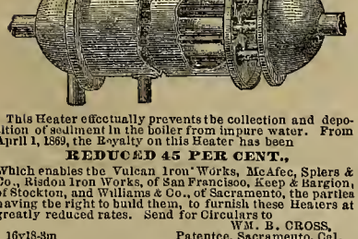
Nos. 25 and 27 Fremont street,

SAN FRANCISCO,

Keep constantly on hand a large stock of best Bar and Bundle Iron, Boiler Tubes, Plate and Sheet Iron, Gas and Water Pipe, Anvils, Cast Steel, Gas and Water Fittings, which they offer to the trade on liberal terms.

21v16-3m W. McCRINDLE, Manage.

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion, of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

WM. B. CROSS,

16v18-3m Patentee, Sacramento, Cal.

MECHANICAL AND ARCHITECTURAL
Drawing School
—FOR—
APPRENTICES.

MR. FREDERICK HELLERT,

An experienced Draughtsman and Teacher, has opened an Evening School at No. 414 CLAY STREET (same entrance as the Mining and Scientific Press Office), where he is giving thorough instructions in DRAWING to apprentices who are inclined to self-improvement. His terms are moderate and within reach of the humblest apprentice; and we are pleased to say that the enterprise is meeting with success.

1v18.tf

MINING AND SCIENTIFIC PRESS.—This useful and scientific journal has entered upon its eighteenth volume. To the scientific, mechanic, and practical men of all classes it is almost invaluable; and we are glad to learn that it is increasing in patronage every day.

The publishers, Dewey & Co., San Francisco, say the present volume shall be superior in all respects to its predecessors.

The terms are $5 in advance, $3 for six months.—*San Bernardino Guardian, March 6th.*

Mining Property for Sale.

A Two Thirds Interest
OF THE
Golden Rule Mining Company's Claims and Mill,

Situated in Tuolumne County, California, two and a half miles south of Jamestown, on the Great Mother Quartz Lode. A good 15-stamp Water Power Quartz Mill is situated on the property, with a never-failing supply of water, as can be shown by the last four years continual running. This Claim has three parallel Ledges, from 50 to 100 feet apart, averaging from two to six feet in width, with a length of six hundred feet. They are so situated that a tunnel has been run through them at right angles, making a surface drainage of from seventy to eighty feet in depth on the mine. The mine is well ventilated by shafts from the surface, and well timbered so far as worked. In the mine are steam Hoisting Works, capable of hoisting from a depth of 300 feet. A force of thirteen men only are required to keep both mill and mine running regularly.

On the surface and flats for a distance of 500 feet from these veins, the ground or surface was mined by placer miners, in former years, producing from two to five ounces per day to the man, during the season when water could be obtained, which fact goes to prove that a heavy deposit of ore was once contained in the croppings of these shutes, which, by all former and present theories of deep mine workings, came from below, indicating that when sunk upon to a proper depth, the lead will develop a mine equal to the Amador or Eureka.

This claim has paid its 19th regular dividend of $1,500 each, during the past four years, besides all the construction and other expense account, and has levied no assessments during the same time, and at present has on hand $3,000 in the Treasury, and no debts.

The last level, 150 feet from the surface rock, averaged $7 per ton, on which was a profit of from $1 to $1 50 per ton. The length of the two shutes of ore on the east vein, and the only one worked upon, has been about 200 feet.

Now I propose to sell two-thirds of this valuable property for $16,000, cash; and any party who desires to purchase a property of this kind—which theory has proven that it requires depth, on well known shutes of ore, for a sure fortune—can obtain a chance here, providing he or they will go down a sufficient depth. No purchaser is solicited unless he first goes and examine the mine, or sends a mining engineer in whom he can have confidence, to indorse what he may think proper of what has been here stated.

For any further particulars, direct by letter to Wm. Bosworth, San Francisco, P. O. Box 1978, or at my office, room No. 5, over Honohoe & Kelly's Bank.

22v18tfqr WM. BOSWORTH.

Resources & Developments

HOW TO FIND AND LOCATE GOOD GOVERNMENT LANDS.—Determine what land district or locality is preferred; then go to the clerk of the Land Office of that district, or County Surveyor, and procure a sketch or diagram of the region, showing as far as possible what lands remain vacant. Very little additional information will enable the settler to accomplish his purposes. The present is a good season for agricultural prospecting, since the best idea can now be obtained touching quality of grass, drying out, and necessity for irrigation from the appearance of growing crops. There is no lack of vacant Government lands almost anywhere; but the charge of dryness, poor soil, or inaccessibility, causes them to be passed by until some experiment proves that the neglect was mainly owing to the plentitude of the article, and a lack of demand for it at the time. Californians are not satisfied, unfortunately, with anything less than a ranch of several thousand acres, and the result is that all but a few continue to pursue the miner's phantom of luck too often, without realizing anything. Ranch lands, or speculative tracts that cannot be bought by subdivision, are always open to purchase by a combination of individuals into homestead, irrigation, reclamation, or joint-producing and manufacturing companies, the formation of which is highly to be recommended, as almost certain to be of profit to those who are able to suggest and carry out any project of the kind.

NORTHEASTERN CALIFORNIA.—As one of the *five* railroad surveying parties now on the Oregon extension of the C. P. R. R. Co's operations has taken the route via Pitt river and Klamath lakes, we give the following description of the geography and resources of that country from the report in the Yreka *Union* of Davidson, White and others of Scott Valley, who have recently returned from an exploring trip to Big Valley. This is a very fine and an important unsettled valley, fifty miles long by thirty in width, and nearly all of a deep, rich alluvial soil. Running into it are numerous creeks, along which are a succession of fine valleys, adjacent to timber, and having fine stock ranges in the hills behind. Similar valleys, though generally smaller, are found farther on, in the Goose lake, Klamath lake and Lost river country, which are valuable for stock and grain even without the market facilities that may be brought about by a railroad.

RAISING HORSES.—Notwithstanding the abundance of horses and the cheapness of pasturage in California, says the *Alta*, we pay tribute for horses to Oregon. We have 220,000 horses and mules, about two for every voter, on an average, and still we must import more. The reason is that our farmers and rancheros do not understand what is wanted. They have large herds of California horses for which there is no demand, and they make no effort to get good Black Hawk and thoroughbred horses for carriage use, or Clydesdale for heavy city work. The mustang is an excellent animal in his place. For the general purposes of the ranchero, he is equal, if not preferable, to any other stock; but he lacks beauty, weight and strength, as compared with other varieties. While the ordinary horse will command from $50 to $60 only, animals of finer blood will bring from $200 to $500 and upwards. It costs but a trifle more to raise a good horse than it does to raise a poor one. Too little attention is paid to this fact by our California stock growers.

THE ALASKA FUR TRADE.—The steamer Constantine arrived a few days since from Sitka, via Victoria, with about $12,000 worth of skins from the fur-bearing animals of Alaska, such as foxes, mink, etc.

There is an apparent infraction of the law in this case in the killing of the fur-bearing animals, outside of the "regulations" provided therefor. The same parties recently received a similar lot by another vessel, taken under the same circumstances. Both shipments are in custody of the law, awaiting a decision of the matter.

OUR COAST FISHERIES.—It is suggested that bringing the large fish of our southern coast alive to this city in smacks, and the curing of herrings, sardines and anchovies, which abound in our bays, might be made a profitable occupation. The two last named varieties of fish are imported in jars and cans, and sell from twenty-five cents to one dollar per pound; and there is no reason why they could not be preserved here in a manner equal to the best from Europe.

SHEEP RAISING IN OREGON.—It is estimated that not less than 40,000 sheep have been purchased in Marion, Linn and Benton counties (Willamette Valley), Oregon, and driven to other parts—chiefly to California—during the past spring. Ten thousand were recently driven away in one drove.

GROWTH AND VALUE OF FOREST TREES.—Sixteen years ago four locust trees, small saplings, were planted in Sacramento. Recently they were cut down. From their trunks twenty-nine wagon hubs were made, and from the remaining portions of the trees four cords of firewood were made.

IMMIGRATION.—Over 25,000 emigrants left Liverpool for the United States during the month of May.

"THE TYRANNY OF LABOR."—Thirty years ago, the practice of hardening needles in oil instead of water, was revived in Birmingham. Needles hardened in water were generally made crooked in the process, and this circumstance gave employment to a considerable number of "straighteners." The oil-hardened needles were invariably straight, and thus a large section of local craftsmen found, like Othello, their occupation gone. A determined volley of abuse was poured on the unfortunate reviver of this process. He was several times mobbed, and ultimately driven from the town.—*The Engineer.*

BEAR TESTIMONY TO THE

Wonderful Curative Effects of

Dr. Joseph Walker's

"The Life of all Flesh is the Blood thereof."—Purify the Blood and the health of the whole system will follow. It a gentle Purgative as well as a Tonic.

These Bitters are not a gilded pill, to delight the eye or please the fancy, but a medical preparation, composed of the best vegetable ingredients known.

CALIFORNIA

VINEGAR BITTERS,

THE GREAT BLOOD PURIFIER.

Cleanse the vitiated blood whenever you find its impurities bursting through the skin in Pimples, Eruptions, or Sores; cleanse it when you find it obstructed or sluggish in the veins; cleanse it when it is foul, and your feelings will tell you when. Keep the blood healthy, and all will be well.

Dyspepsia or Indigestion.

Headache, Pain in the Shoulders, Coughs, Tightness of the Chest, Dizziness, Sour Eructations of the Stomach, Bad Taste in the Mouth, Bilious Attacks, Palpitation of the Heart, Inflammation of the Lungs, Copious Discharges of Urine, Pain in the Regions of the Kidneys, and a hundred other painful symptoms are the offspring of this Dyspepsia. For these troubles take Dr. Walker's Vinegar Bitters, and quickly all painful symptoms will disappear.

It Is a Gentle Purgative as well as a Tonic,

Possessing, also, the peculiar merit of acting as a powerful agent in relieving Congestion or Inflammation of the Liver, and all the Visceral Organs. In this respect, these Bitters have no equal.

For Female Complaints,

Whether in the young or old, married or single, at the dawn of womanhood or the turn of life, these Tonic Bitters display so decided an influence that a marked improvement is soon perceptible in the health of the patient.

For Inflammatory and Chronic Rheumatism and Gout,

These Bitters have been most successful. They are caused by vitiated blood, which is generally produced by derangement of the digestive organs.

PIN, TAPE and other WORMS, lurking in the system of so many thousands on this Coast are effectually destroyed and removed.

Morbid Condition of the Blood.

This is the fruitful source of many diseases, such as Tetter or Salt Rheum, Ringworm Boils, Carbuncles, Sores, Ulcers, Pimples, and Eruptions of all kinds. For the cure of these various affections, which are mere symptoms of a morbid condition of the blood, medical science and skill have not, as yet, discovered a Blood Purifier equal to Walker's Vinegar Bitters.

Diseases of the Blood, Liver, Kidneys, and Bladder.

It thoroughly eradicates every kind of humor and bad taint, and restores the entire system to a healthy condition. It is perfectly harmless, never producing the slightest injury.

Bilious Remittent and Intermittent Fevers,

Which are so prevalent in the Valleys of the Pacific Coast, especially those of the Sacramento, San Joaquin and their tributaries, during the Summer and Autumn, and especially during seasons of unusual heat and dryness, are invariably accompanied with extensive derangements of the stomach and liver, and other abdominal viscera. There are always more or less obstructions of the liver, a weakness and irritable state of the stomach, and great torpor of the bowels, being clogged up with vitiated accumulations. In their treatment, a purgative, exerting a powerful influence upon these various organs, is essentially necessary. There is no cathartic for this purpose equal to Dr. J. Walker's Vinegar Bitters, as they will speedily remove the dark-colored viscid matter with which the bowels are loaded, at the same time stimulating the secretions of the liver and restoring the healthy functions of the digestive organs generally. The universal popularity of this valuable remedy in regions subject to miasmatic influences, is sufficient evidence of its power as a remedy in such diseases.

For full directions read carefully the circular around each bottle.

For sale by all druggists and dealers.

R. H. McDONALD & CO.,

Druggists and Agents, Corner Pine and Sansome streets, San Francisco, Cal., and Sacramento, Cal; and 34 Platt street, New York.

Liberality of Physicians.

[From the Pacific Medical and Surgical Journal.]

It has always been said that physicians would disparage any remedy, however valuable, which they did not originate themselves. This has been disproved by their liberal course towards J. WALKER'S VINEGAR BITTERS, they well knowing them to be an invaluable preparation manufactured from the native herbs and roots heretofore known only to the Spaniards and Indians of California. Many of the profession, after having tested their virtues, have adopted them into general use in their practice, thereby showing a willingness, commendable on their part, to countenance articles that have intrinsic merit. This is highly creditable to the learned profession of California, and contradicts the prevalent notion of their opposition to remedies based on interest to discard them. We have always had confidence in the honorable motives of our medical men, and are glad to find it sustained by the liberal welcome they accord to Dr. J. WALKER'S INIMITABLE VINEGAR BITTERS, even though they are not ordered in the books, but are made known to the public through the newspapers, and other mediums of advertising.

Pure Blood and Pure Water.

Pure blood may be compared to pure water and impure blood to muddy water. If you pass muddy water through muslin, you soil it; continue the process, and you cover it with thick mud. Blood is the great circulating medium, passing through all parts of the body, and, if impure, it leaves its impurities behind, which breed sickness and death. Medical science has utterly failed hitherto to furnish a medical agent for renovating and purifying the blood equal to Dr. Joseph Walker's Vinegar Bitters. They are easy in their administration, prompt in their action, and certain in their result. Their peculiar vegetable properties penetrate at once to the seat of disease, and eradicate all impure or poisonous matter from the system. Climatic changes, which so materially affect the great majority of preparations, have no effect on this remedy. It is used successfully in all climates and countries, north and south alike, and has never been known to fail in a single instance when the directions have been followed. Let those afflicted with disease try one bottle of these Bitters and it will prove a better guarantee of their merits than all we or others can say in their favor. Thousands now pronounced incurable may be saved and their lives prolonged by the use of this valuable medicine. To those who seek health we would say, there is no man, woman or child, however wasted by disease, but what may be relieved or cured by these Bitters, if their system is in a condition to receive nourishment, and the Lungs, Liver and Kidneys, and other vital organs, are not wasted beyond the process of repair.

None genuine unless signed

DR. JOSEPH WALKER'S

VINEGAR BITTERS.

SAN FRANCISCO, Cal., Jan., 1869.

Read the following Letter from Dr. J. Walker.

READER.—Do not cast this aside with a look of contempt. If you chance to be one of the lucky few who are never ailing, preserve this and hand it to your invalid friend, that he may know the means of becoming well, hearty and vigorous, and to live to die of old age.

Four years ago I was, what I thought, "a used up man," which was also the opinion of my friends and acquaintances.

I had the Consumption, Bronchitis, Palpitation of the Heart, Piles, and Rheumatism in my Hip. My leg became paralyzed, and my whole side partially so. I was then in California, and was given up by physicians as incurable. I tried everything I thought would help me that I could find in the apothecary shops, but to no purpose. Die I thought I must.

One day I was near a camp of Indians, and found them gathering and picking herbs. I inquired what they used them for, and they told me. I then went to experiment on a compound which I perfected and commenced taking, and to my utter surprise, in three weeks was able to attend to my business, and after taking it eight months I felt better than I ever did in my life, and considered myself well. Many persons who knew my former condition were surprised when they saw how well and hearty I was, and came to me for the medicine for themselves and friends. In fact, with my small means of manufacturing, I could not supply the demand. I had to put them up in jugs, junk bottles and anything I could get, and found they produced such astonishing effects upon all diseases, that I thought it my duty to put them within the reach of all suffering humanity.

I moved to San Francisco, and commenced putting them up, calling them J. WALKER'S CALIFORNIA VINEGAR BITTERS.

I have disposed of hundreds of thousands of bottles, and, to my knowledge, not a single person who has taken them but it has helped or cured. On women the effect is magical, making the old fresh and vigorous, and giving to the young life and ambition.

Now I assert without fear of successful contradiction that there is no disease these Bitters will not cure. I know that there are hundreds that will doubt this, but to them I say, bring me the case, and if I do not cure them with my Bitters, I will forfeit $100, providing the lungs are not too far gone, or the bones not destroyed by minerals or other means. People may call me a humbug, and doctors may cry out against me, and well they may, for their occupation is gone.

In conclusion, to the afflicted let me say, give my Bitters trial, it is all I ask—they will speak for themselves.

Respectfully yours, JOSEPH WALKER.

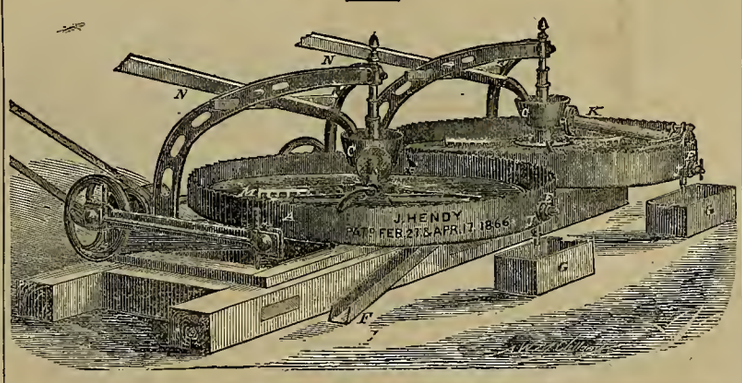
PREMIUM FOR BEST CONCENTRATOR
AWARDED BY THE
MECHANICS' INSTITUTE, 1868,
ALSO AT THE STATE FAIR FOR 1868,
To J. HENDY.



A LARGE NUMBER OF THESE
IMPROVED CONCENTRATORS
ARE IN PRACTICAL USE ON THE PACIFIC COAST.]

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

OFFICE OF NORTH STAR MINE, GRASS VALLEY, Nov. 12, 1868.

JOSHUA HENDY, ESQ.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.

Respectfully yours, J. H. CROSSMAN, Supt. N. S. Mine.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GYOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

Stockworks in Limestone—The Eberhardt Mine, White Pine.

The assertion has been made by many quite confidently that there are veins or systems of fissures in Treasure Hill; but it would manifestly be a very different thing to assert that these contain rich ores, or even that they contain the principal ore deposits, or anything whatever of a paying nature. There exist such things as barren veins,—and they are the rule,—in this world where all is not made of silver. Veins may be barren indeed, of all but spar or quartz, and yet have been the ore channels of adjacent wealth the most astounding in character and quantity.

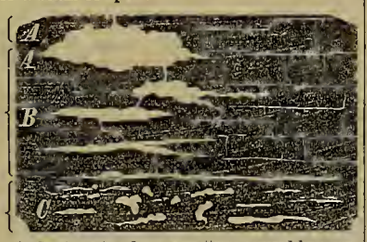
Stockworks of ores of the useful and precious metals are most interesting freaks of nature. Where nature plays pretty freaks, or lavishes herself fondly in oddities humanly-attractive, there is always hidden some beautiful, simple law, which she is thus inciting us to recognize, and to appreciate if possible in all its satisfactoriness and grandeur. It is not difficult to comprehend the straight-forward ordinary and regularly operating principles of the geology of veins; there is nothing more abstruse in that than there is in the formation of a sediment, or of an incrustation. Stockworks are apparently exceptions; but they are nothing more than modifications, arising from altered circumstances—to astonish and agreeably surprise us. How much of exceptional freshness do we find in the operation of natural laws; and is not nature kind in affording us an infinite continuation, puzzles the solving of which is not merely a pleasure but wisdom and fortune in hard cash on the spot?

The richest ore deposits of most of the metals ever known were in the form of stockworks. History, romance and the arts, cling fondly around the famous metallic silver deposits of Mexico and Peru, and their discoverers and heroes, of two centuries ago. Who knows how the Chloriders or the Eberhardters may yet float down on Time, by the side of the genial ex-hardsman and miner of Regla, the subsequent Don and Marquis that saved the finances of the Spanish State, and who left lasting to this day memorials of his wise liberality to his native mining region. Or of Pizarro, who is nothing to the world but a name of sounding syllables.

We find the Treasure Hill chlorides situated and mined as stockworks in limestone—in dolomite or magnesian limestone, properly speaking. Of all rocks known and famed for strange and wonderful things,—for caves and eyeless fish, for underground rivers, for stalactites, and pseudomorphs, for fossils, and crystals of exquisite beauty, that rival the diamond, only that they are perishable,—limestone rock stands foremost, but we associate with its phenomena not merely the queer and fanciful things of subterranean physics. It was in its caverns that our Gothic fathers sacrificed to the gods, for those were

"The blood-stained mansions of gigantic Thor."

The shelter of limestone caves is not abandoned to gloom and savage wolves entirely. "Lot dwelt in a cave, he and his two daughters." (Gene is xix.) They found themselves more cosily situated than the pillar of salt. Chloride of Silver too loves the limestone caves; so does sulphuret of lead, for the galena deposits of Illinois and Wisconsin are all comfortably nestled congregations of crystals of ore in openings and crevices in the same friendly rock, where naught could disturb them but the miners' pick when they had the misfortune to be betrayed to the light of day by seams of tale-telling spar, leading the miner from the "cap rock" down to their hiding places. Where can the chloriders have got the expression of "cap rock" from, but from some old Galenean amongst them, who comprehended the significance of a seam of spar?



A. Crevice going down, sometimes covered by a capping of a different consistency of rock.
B. Ore in irregular bodies, forming, in the aggregate, a chimney.
C. Flinty stratum, in which the ore bodies are still more irregular.

The above is a diagram of one of the most characteristic of the galena mines of the Western States, figured with dozens of others like it in Whitney's Report on the "Lead Regions of the Upper Mississippi," a work, by the by, of decided merit, and worthy of perusal by White Pine miners. It is known as Major Davenport's Diggings, near Shulsbury, Wisconsin. The vertical lines represent the seams, corresponding to the vein in other rocks, and the horizontal enlargements the bodies of ore, in openings that had been eaten out between limestone strata. The same diagram would answer in part to represent a mine reported by Mr. Stetefeldt, containing sulphuret and base metal ores, in Cortez district, as well as other mines in the limestone districts of Nevada, including some of those, perhaps, on Treasure Hill; though the details in Nevada are widely different, owing to the prevalence of intense metamorphic action which is entirely wanting in the Mississippi mining region.

Great similarity is believed to exist between this character of the Mississippi mines, and the renowned rich silver lead district of the Sierra de Gador in Spain, as described by Le Play; the ore there occurring, likewise, in irregular shapes in limestone caves. The above is adduced to illustrate the peculiarities of stockwork deposits in limestone, which are owing mainly to the character of that rock, and the reactions of subterranean waters upon carbonate of lime.

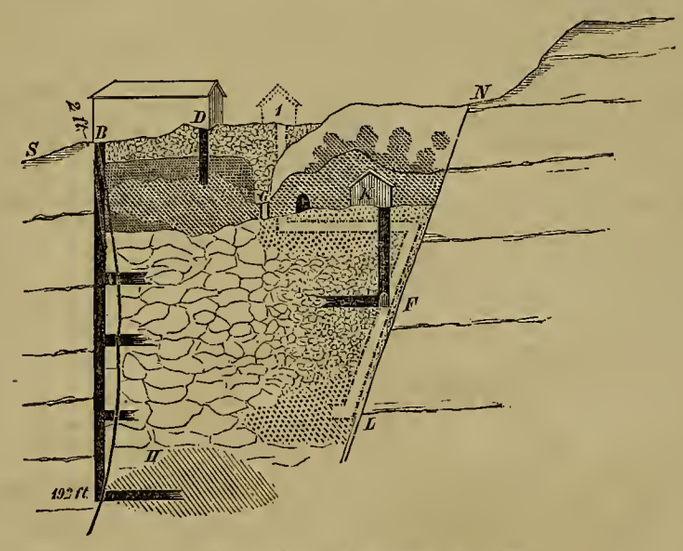


DIAGRAM OF THE EBERHARDT MINE, WHITE PINE.

Further comparisons of the world's famous lead and silver districts situated in limestone or dolomite, would be of interest in this connection; the fact being somewhat remarkable that they generally belong to a very ancient geological period—the Carboniferous or Silurian—and that the limestone is usually magnesian, while the deposits are noted for their curious exceptional nature from the rule of veins.

It is almost universally agreed by scientific men that ordinary and simple chemical reactions in the waters circulating under the surface have been the means of concentrating minerals in deposits. Silver in solution as chloride in alkaline waters permeating limestone rocks, would be precipitated by the disengagement of carbonic acid from the limestone, or by the waters becoming sour from any other cause; or by thinning, by the addition of fresh waters from the surface, of its saltiness, the alkaline ingredient which has made the chloride soluble.

It is the working miner's *business* to find out where are situated the richest deposits; he need not be jealous or fearful of ever being robbed of his prerogative of doing the necessary hard work on uncertainty. He knows by his infallible "science of knocks," that he has a rich deposit after he has found it. The thinking miner recognizes in addition the grand truth that there is in everything a reason, or at least a method, and he seeks to discover it and to work by its light. Every intelligent miner is therefore a geologist by pursuit, and would do well to acquaint himself, if possible, with such elementary truths of geology and chemical reaction as have daily and vital bearing upon his interests.

The great Eberhardt ore deposit here represented, which has yielded now about two millions of dollars' worth of chloride of silver, more than one and a half millions of which is in circulation as bullion and coin, is a stockwork, or a succession of stockworks in limestone—a brecciated mass between two fissures which may, and it would seem very probably do continue in depth into one true vein.

Webster's Unabridged, last edition, will be found well nigh sufficiently explicit to determine the matter of the "name." Our diagram illustrates the "thing" itself, representing the nature of the developments that have been made. It is a north and south section across the vein. The opposite walls are 183 feet apart, and not truly parallel by a number of degrees (in the short distance of the south wall that has been developed,) the intervening space being filled up with country rock. The latter, as found between the opposite wall fissures, is broken up to a different degree of fineness somewhat as represented in the engraving, viz., more at the surface, and for some distance down along the northern wall, than in the middle and along the southern wall, at which places the breccia is more nearly massive, and is not in any very marked manner different in appearance from the country rock found outside of the wall fissures.

Irregularly throughout this brecoia, but greatest in horizontal expansion, are found the chloride bonanzas, or stockworks, represented in the cut by shaded broken lines slanting from the left downwards to the right hand. There has been one great rich bonanza, of wonderful extent, represented by the heavier broken lines seen inclosed within the irregular boundaries, and in two parts—the open cut to the right, and the underground galleries to the left of the gate G—which has afforded the principal wealth of the Eberhardt mine; and its ore is not yet all taken out, the principal forces of the mine being at present employed in the lower levels. In the

Fat vs. Lean.

BY A YOUTH OF ALDERMANIC PROPORTIONS.

Mr. Editor :—I am a young man just budding from youth into manhood, and possessing all the traits of character peculiar to that class of humanity. Thus far I do not differ from the generality of my race, but I am afflicted with a common and well-known disease, to which none but strong and able-bodied men are subject. I am corpnlent. Yes, a young man just tnrning six and twenty, complains of being overburdened with a superabundance of adipose matter. My friends have invariably endeavored to persuade me that I am no fatter than other men, but the growing rotundity of my figure and the tell-tale story of the weighing beam, which has mounted up, and up, until now it stands in the 200-pound notch, is more convincing that I have full grounds for complaint than all their argnments to the contrary.

Now the truth is, I don't want to be corpulent, and I want your friendly advice as to how I shall proceed to reduce my size. I want to be lithe and free in limb, and he ahle to walk the streets with an easy, graceful movement. Ducks waddle—so do fat men. People say, oh, it gives you dignity. Confound the dignity, I say, if a man has to carry an extra fifty or sixty pounds weight, in order to support it. If that is dignity, why I have no respect for it, and the sooner I get rid of mine the better. When I meet an old friend on the street, his exclamation is, "How well you are looking. You are getting quite *stout*." Not strength of muscle, certainly, as the more of this kind of strength I accumulate, the harder work I have to carry it. Why, sir, I would rather have the phthisic, neuralgia, tooth-ache, worms, or any other of the numerous plagues which torment the alender man, than be afflicted with this everlasting load of fat, which only needs to be incorporated with the necessary quantity of alkali to couvert it into a batch of No. 1 soap. Sympathizing persons say, "Chew tobacco, or smoke, and your size will decrease. Now, Mr. Editor, I know that I am not the keenest person in the world, but I think I detect in this recommendation a bit of aarcasm which said sympathizing persons wish to throw in my path. The fact is, I do chew tobacco,—indeed, I have almost converted myself into a regular tobacco-worm; but that fat keeps accumulating. So tobacco won't do. Another says, "try Banting, and you surely will gain your highest ambition, and that shortly. Well, that will do very well for persons who are inclined that way, which I decidedly am not. I recollect in early daya it was the custom of aome old fossils who had played themselves out before the public, to go into retreat,—hermits I believe they called them. Now I hope my advisers do not wish me to make a hermit of myself, and abstain from all the sweet and delicious eatables that I see others enjoying with suoh gusto. This will not do, especially in San Francisco, where a walk through our markets would cause a man, who thus proscribea himself, to feel indeed like the rich man when he saw Lazarus across the abyss.

Aa for exercise, that is entirely outof the question in my present condition of flesh; besides, everybody knowa that exercise creates an appctite, in the satisfying of which more fat is created.

Now, Mr. Editor, I see that your paper is run in the interest of inventors, and what I want ia, that you ahould aet some of your inventive geniuses to work to get up something that will reduce fatty accumulations in the human system, without the necessity of putting the patient through a atarvation process. The person who would give to the world snch an antidote, would secure to himself the everlasting thanks of our most worthy and respected fat fellow citizens. Lambert.

[We cannot recommend anything better than Banting; but do not doubt that ingenuity aet to work could hit upon some method that would accomplish our correapondent'a purpose,—more effectually, perhaps, than agreeably, if he were not too fastidious.—Ed.]

Written for the Mining and Scientific Press.

Tin Ore Concentration.

Editors Press :—A very interesting experiment having heen made the other day at Messrs. Dwyer & Storm's, South Point, I beg to furnish yon with the details, in the hope that some of your readers may possibly derive information from them, which may he of value to millmen or to those engaged in the dressing or concentration of ores.

The San Jacinto Tin Mining Company, operating in San Bernardino County, about sixty miles N. E. from Los Angeles on the Butterfield road, have heen for some time making experiments on different kinds of concentrators for dressing the tin ores, which they have, from time to time, extracted and forwarded to this city for treatment, but without attaining results sufficiently satisfactory to the company.

A lot of 2,000 pounds of the ore was delivered by the company's agent on Monday last, to Mr. Hungerford, for treatment in his improved concentrator, with a view of comparing its results with those obtained from the Cornish buddle and other sulphuret saving machiues. The average assay of the ore iu Mr. Hungerford's possession gave a yield of 25 per cent. of metal, contained chiefly in the red oxide of tin. The clean-up of the conceutrator, at the expiration of two hours, showed 1,315 pounds of concentrated ore, yielding by assay 6 per cent. of metallic tin. Two Cornish gentlemen who were present, were much astonished at the result ohtained, pronouncing it supsrior to the work done by the improved buddles now in use in Cornwall.

Where concentrators can be had so low and are easily transported and not liable to get out of order, with common care I fancy that fine gold, amalgam, and auriferous sulphurets should no longer be found in the tailings of our quartz mills.

W. G. Kelly, M. E.,
Late Supt. N. Y. and Idaho G. & S. M. Co.
San Francisco, June 16th, 1869.

The Wonderful Clock of the Day.

"The celebrated clock of Strasbourg is put into the shade hy that now exhibiting in Paris for the Cathedral of Beauvais. Forty thousand francs was the sum originally subscribed for this clock, and for the last four yeara ten clockmakers and twenty assistants have bcen at work on it. It has cost 100,000 francs more than the origiual estimate—has fourteen different movements, and 90,000 distinct pieces of machinery. The case is thirty-three feet high, in carved oak, over fifteen feet broad, and nearly nine feet in depth. At each hour a figure of Providence, snrmounting the clock, makes a gesture, and numerous saints appear at windows, apparently listening to the crowing of a cock. The principal of the fifty dials has a figure of Christ in euamel upon copper, and ahove and surrouuding this are the twelve apostles, also in enamel. The pendulum weighs nearly 200 pounds. The machinery must be wound up every eight days. Not only doos the clock show the hours, and chime each quarter, but there are dials showing the days of the week, the motions of the planets, the rising and setting of the sun, the hours in the different chief cities of the world, the seasons, the zodiacal signs, the length of each day and night, the equation of time, datea, saints' days, the changes of the moon, tidc, solstices, movahle feasts, the age of the world, leap years, longitudes and latitudes, eclipses, and every century that expiros."

Watering Railroad Stock.—Twenty-eight American railroads have been named, with an aggregate stock in 1867, of $287,000,000, which in two years has been increased by "watering," to $400,000,000. The nice little sum of $113,000,000 has thus been "made out of nothing." This heats San Francisco "wild cat," and all the milkmen of the age.

New Orleans, since the war, has been one of the most prosperous cities in the Union. She has built fully 6,000 houses, and is adding 10 per cent. a year to her population. San Francisco is doing no better.

Familiar Science.

Teeth and their Decay.

Civilization makes sad work with our teeth. Savages and people who live on very plain food are rarely troubled with defective ones. The foundation for sound teeth must be laid in early life. Bread made from unbolted whcaten flour furnishes a most excellent pabulum for them, hy rsason of the abundance of lime which it contains. Butter also coutains a good proportion of lime, and hence those who eat freely of it secure a good amount of material for building up their teeth. Children are generally lovers of bread and butter; no food can be healthier for them, and the nearer the approach to Graham bread, the better. The lime in both flour and butter occurs as a phosphate of lime. Hot drinks and concentrated acids are deleterions to the testh; the latter act directly upon the lime in their composition, and tend to crumble them down. This disintegrating action is sometimes pretty sensihly felt, hy the teeth being "set on edge," when we take anything particularly sour into the mouth. That peculiar sensation is produced by the acid eating its way into the teeth, with an activity which would soon completely destroy them, if continued.

Sugar has generally heen placed under a ban for its supposed injury to testh. Those who thus regard it point to the employés in sugar refineries, who are constantly tasting of the sugar, and who generally lose their teeth, from natural decay, within a few years. On the other hand, we are as often cited to those engaged on sugar plantations, where there is still more "tasting," but where there is very little indication of dental decay.

Again, the strongest solution of refined sugar has no action upon teeth, after extracted, even whsn allowed to remain therein for months; but wherever a very small quantity of lime or alkali is added to the solution, disintegration soon takes place. This latter circumstance explains the oontradictory nature of the facts connected with the plantation and refinery. Lime is always more or less employed in refining sugar, and the decay of teeth from "tasting" in the refinery is undoubtedly due to its presence during the process of refining. Hence the inferior varieties of sugars are injurions to the teeth, while pure white sugar is perfectly harmless. Confectionery is often more or less adulturated with lime; hence the damage to teeth which is somctimes attributed to that source.

Pure cane juice and pure refined sugar will nevcr injure the tecth. Neithor will pure honey, or the juices of such fruits aa contain a large proportion of sugar, such as strawberries, plums, etc.; but very sour apples, or any other excessively sour fruit is bad for reasons already given.

Teeth are made for grinding grain, or some similar work, and with a plenty of such work, proper diet, and good general health, they wonld never decay, except from extreme old age. They suffer when they have nothing to do. When a griuder is removed, the opposing teeth, through lack of something to press against, will generally be pushed forward into the cavity, until it becomes loosened, and finally lost, perhapa without decay. Teeth ofton prematurely decay from a faulty structure—porous or fragile—a structure marked by a chalky appearance, and generally due to bad health or improper food. No amount or quality of dentrifice will ever give the pearly whitenëss, so much admired, to such teeth. Acids and impure swcets act more readily upou such teeth, than upon those which are covered with a pure enamel.

To Renovate Black Silk.—Rub the silk all over on the right side with a solution of ammonia and water (two teaspoonfuls of powdered ammonia to quarter of a pint of warm water), and smooth it on the wrong side with a moderately hot iron, and the silk will regain a bright black appearance.

How Rain is Produced.

Where does the rain come from? You answer, "From the clouds." But where do the clouds come from? You may think the wind hlows them over you. But if it hlows clouds over you from somewhere else, it also hlows them *from* over you to other places. The fact is, the water of the clouds is just as much over you on a clsar day as on a cloudy or rainy day. On a fair day when no clouds are seen, the water is divided up into such small particles that it does not ohstruct the sun's light, and so you *see* no clouds or water. A change of temperature in the atmosphere, as when a warmer and colder current of air meet, causes the small particles of water to unite in pairs, and the pairs unite, and these quadruple drops unite, and so on until hundreds or thousands of the small invisible particles unite in one, and even then that one may be many hnndred times smaller than a pin's head. A mass of these combined drops which are still small enough to float in the air, reflects, refracts, or bsnds out of their course so many of the sun's rays that they stop and often darken its light. It is thus that clonds gather in a clear sky. When a sufficient numher of drops unite to form one too heavy to float in the air, it begins to fall. It meets and unites with many others in falling, and often so many unite that great rain drops are formed by the time they get to the ground. Each large drop is made up of thousands, perhaps millions of the small drops that float in the unseen air in a clear sky.

The Philosophy of the Aquarium.

C. B. Brigham, in the *American Naturalist*, thns describes the manner in which the balance of forces in a self-supporting aquarium are maintained: "The element in water which the fishes live on by breathing is free oxygen, which, as the watsr is fanned through the gills or lungs of the fish, comes in contact with the walls of its vessels, and arterializes the blood; all water contains a certain amount of this oxygen, sufficient to keep a fish alive for a short time, but if no means are taken to create a fresh supply, it will become exhausted sooner or later, and an escape of oarbouic acid will render the water poisonous to the fish. In plants, on the other hand, we have an agent takiug up thc carbonio acid in the water, and resolving it into carbon and oxygen, the former of which it converts into its substance, while it expels the latter from every part of its tissue, especially from the leaves in the form of minute buhhles, plainly aeen in healthy planta, and often compared to drops of quicksilver in appearance. It is true that plants absorb oxygen also as fishes do, but they give out so much more than they absorb that this is of slight acconnt."

Amount of Water in the Atmosphere. Did you ever think how much water ia in the air, floating nnseen? It generally amounts to nearly three gallons above each foot of the earth's surface, and often much more. As new vapor is always rising, the amonnt of rain that falls during a year is very large. At one place in the Himalaya mountains as many as 300 inches deep falla in twelve months—or enough if it all fell at once to cover the land with water twenty-five feet deep. In San Francisco 35 to 43 inches fall annually. In the Sierra Nevada the annual fall is from five to six feet.

Dried Scent to Put into Satchels, or Little Bags, for Drawers.—Half pound of lavender flowers, half ounce of dried thyme, half onnce of dried mint, quarter ounce of cloves, quarter ounce of caraway seeds, one ounce of common salt. The lavender flowers mnst he ruhbed from the stalk, the thyme and mint reduced to powder, and the cloves and caraway aeeds hruised in a mortar. The whole should then he mixed with the salt, which must be well dried before it is used. When the ingredients have heen thoroughly mixed, the compound may he put into silk or muslin hags for use.

Cause and Effect.—It is often remarked that, at times, a candle or lamp, when first lighted, will "spirit" or "sputter;" when on being lighted at another time, with the same wick, and apparently under the same circumstances, no disturbance in the blaze is noticed. The phenomenon observed in the first instance is due to the fact that the air is overcharged with moisture, which has penetrated the wick, and where (being formed into steam) it expands suddenly, producing a series of little explosions.

Mechanical Progress.

Drills.—Capt. Clariaoal, of the Engineers' School at Metz, reports experiments npoa drills of different forms and sizes, and upon iroa of different hardness. We give from *Van Nostrand's Magazine*, a portioa of his coaclusions:

The power required by a flat drill 0.025 meter in diamotor, to boro a bole in the direction of the fiber, is about 1.25 times as great as that required by a ceater bit of similar diamster operating nnder similar circnmstances.

The power required by a flat drill, 0.025 meter in diameter to bore across the fibers is about 1.4 as much as that required nndsr similar circumstances by a ceuter bit.

When the diamoter of the drills is 0.015 meter, the above qnaatities become 1.6 and 1.8 respectively, which seems to show that small drills reqnire a comparatively greater power than large ones. When the diameter of the drills is 0.008 meter, the ahove proportion becomes 1.52 which corroborates the above.

The average advisable circumfereace speed of drills is 0.12 meter per second in wrought iron, 0.06 meter in cast iron, and 0.15 to 0.18 in bronzs (gun metal). When theso velocities are exceedcd the drill is apt to become soft, and wheu they are not reached the work is not economized.

A comparison of results obtained with borers of both kiads of the same diameter, (0.25) meter), shows that the power required to drive a flat drill in cast iron is 2.6 times as much as that reqnired to drive a center bit.

Experiments on hard wbite cast iron, showed that the power reqnired to drill sucb iron was very nearly double tbat stated for gray cast iron.

Tbe experimeats made on steel showed that, nnder similar circumstances, more power was reqnired to drill shear or soft steel than to drill hard cast steel, and that flat drills increased the power necessary by at least one-third.

Sensitive Flame Burglar Alarm.—An ingenious application of the sensitive flames has heen made by Barrett. A copper rod supports a metallic ribhon, composed of two or more thin leaves of metals which expand nneqnally when heated. A few inches from it is a sensitive flame. As long as tbere is no noise this hurns quietly; but a shrill whistle, or any disturhance, will cause it to diminish one-half in length and to spread out wide in the middle, like the wings of a bird. It thus heats tbe metallic rihhon, which expands nneqnally, bends toward one side, comes in contact with a fine platinum wire attached to a galvanic battery, connects the poles, and rings a hell. Such a light as this in a banking honse wonld betray to the watchman an attempt at robbery, and the inventor proposes to use it as a burglar alarm.

Silverware Proteoted.—The *Mechanics' Magazine* says tbe sulphur compounds witb which the eity atmosphere is impregnated, cause the loss of thousands of pounds worth of silverware annually, in the form of dirt from the frequent cleaning made necessary therehy. But Herr Strolberger, of Munich, has after all sorts of experiments found a remedy. He warms the article, and hrusbes it over carefully with a thin collodion diluted with alcohol. Once is enongb. Silver goods are kept bright for any length of time, while those in the same neighhorhood soon become perfectly black.

Paddle vs. Screw.—Tho London *Artizan* says that a paddle steamer, recently altered at Greenock, was of 350-horse power, with cargo space for 400 tons of goode. Her cousnmption of fuel was 24 tons a day and her speed 7¼ knots. She was converted into a screw steamer, and fitted with a twin propeller, and the consequence has been that with engines of 75-horse power she steams at the rate of 10¼ knots, and carries 800 tons of cargo, with a daily consumption of ahout eight tons of coal ouly.

The New York *Tribune* says that the steamer Lafayette just had her machinery altered from paddle-wheel to propeller, at a considerable outlay, thereby increasing her speed two knots an hour, giviug much more space for cargo, and diminishing her daily consumptiou of coal by 40 tons.

Traction Engines.

Engineering says that the traction-engine system has oa the whole proved a coapleto failure; and that if it ever comes iato geaeral use, a radical change must be made in the arrangement of the entiro machine as compared with those now in use. Wo quote: "Iastead of the portable engiae, we must take the railway locomotive as our model. As the road to be traversed is rongh, and macbiuery does not like rough roads, the two must be kept apart as far as possible. Thersfore, iustead of mouating a boiler balf full of water on rigid wheels without the interposition of springs, and a heavy, qnick running engine and fly-wheol on top of the boiler, we mnst provide a rectangular frame of iron or of oak between iron plates. The frame must be supported on wbeols—preferably of wood—throngh the intervention not only of spriags, bnt of perfectly efficient and elastie springs, with india-rubber buffing pieces to take up the last trace of jar and vihration. Next we have to provide a crank-shaft running in brasses fixed in wrought-iron cheeks—no cast iron except that in the cylinders, aad a little in the gearing should be allowed in a traction engine—wbich crank-shaft must be driven by a pair of pistons, in order to get rid almost or altogether of the fly-wheel—an unaeeessary and objectionable excrescence, which should bave no more place on a traction engine tban it has on a locomotive."

Something New in Clocks.—*Engineering* describes a turret clock just made in Edinhurgh for Bombay, which has a dial 8½ feet in diameter, and a center second hand. This last item is especially notable in connection witb the size of the clock. It has heen considered impracticahle heretofore, to regulate the motion of so long a second hand. The momentum wbich it would have acquired at the point in passing through a space of five inches—the distance between one second mark and another—would have caused the hand to sway backwards and forwards during tbe whole second. Besides, the strain upon the machinery from such a motion would have been great. This difficulty has heen overcome hy a series of sixty levers, so arraaged that the second hand rests in one of them at each beat; the point of the hand being so contrived that when it rests upon a lever it is detained there, and can get neither backward nor forward until the clockwork removes the lever out of the way.

Lubricator for Cylinders.—Ordinary lubricators are liahle to decompose at high temperatures, leaving hehind a thick viscid coatiag which, in cylinders, iaterferes considerably with the motion. Ericsson's hot-air engine is especially difficult to lubricate, from this cause. The use of *melene* is advised for this purpose; it heing a substance obtained from the paraffines, insoluble in water, soluhle in the fixed oils, volatile without decomposition, not boiliag under 370°, of the consistency of wax at ordinary temperatures, and floating on the surface of cold water. It is cheap enough to he used on a large scale, and preserves from oxidation and adhesion.

The Fan Steam Engine.—This engine is analagous in its principle and action toan inward-flow (water) turhine. It consists of an outer annular casing which receives steam from tbe boiler and discharges from its inner surface in tangential jets; anianer cylinder casing having openings at the center for the discharge of waste steam; and a fan consistiug of scoop-shaped blades radiating from a shaft, which rotates within the inner casing, and is driven hy the jets of tangential steam. An engine of this kind has heen successfully used in a sawmill, and was considered equal to an ordinary high-pressure engine.—*Artisan.*

Metallic Springs.—In metallic springs it is found that the elastic power resides in great measure near the surface. A well-tempered har spring will lose much of its elastic strength by filiag off a very thin scale from its surface. The doubling of the thickness, the width remaining constant, will not give douhle power, while doubling the width will uearly douhle the elastic power if the thickuess he the same. *Scientific American.*

Scientific Progress.

Invisible Light.

Some years since, iu a photograph taken at Berlin of a bronze statue, a black streak appeared, in the negativo, at tbe tip of a laace held upright hy the figuro, and at two otber poiats. Prof. Dovo, who was applied to for an explanation of this extraordiuary circumstanee, came to the conclusion that tbose markiags might be dne to electrical discharges going on from prominent points of the figure at the time the pieture was taken, and which, though invisible to an observer, would nevertheless, by reasou of the actinie power of electrio light, produce an impression on the photographie light. Prof. Rood, of Columbia College, N. Y., in a series of ingenious experiments, proved that discharges entirely invisible to the observer in daylight, might thus produce images of tbemselves—the photographie plate being relatively more sensitive to these impressions than the human eye.

Geissler tubss,—glass tubes exhausted, aad sealed up, with platinum wires in their extremities, were employed. When the electric discharge from an indnction coil was made to pass through these, it developed a delicate purple and blue, or sometimes pink light, which, though visible in the dark, was not perceptible in daylight. A photograph, however, of these tuhes, taken in daylight, showed as well developed an image of the interior light, or discharge, as of the tube itself. Again,—if a spectrum is produced with sunlight, hy means of prisms and lenses of quartz, we shall see all the rainbow tints, crossed by the black lines, exactly as with the prisms and lenses of glass; but if we allow this spectrum to fall upon a collodion plate, the picture produced, besides showing the visible bands in the blue, indigo and violet parts of the spectrum, will give an equally distinet drawing of similar bands or lines, reaching to a great distance heyond, what, to the eye, is the end of the luminous stripe. This part of the picture may be regarded as a photograph, not of *light*, but of *darkness*. It may be made appreciable to tbe eye *indirectly*, if it is allowed to fall on a screen made of some fluorescent substance, as for example, a solution of quinine, wbich absorhs the very rapid actinic rays and emits them as luminous ones. The *Journal of the Franklin Institute* gives a cut of the photograph of the extra-violet spectrum.

Diatoms for Microscopists.—The *American Naturalist* thus alludes to Möller's new side plates for the microscope: "Möller of Wedel, Holstein, has accomplished the most wonderful feat of modern manipulation, with tbe exception, perhaps, of Nohert's ruled lines. The slides he prepares have been described to us in tbe letter of a correspondent, wbo is tbe fortunate possessor of two. "The diatoms (four hundred species in all), arranged by genera and species, form groups of one hundred, set with the most perfect regularity and symmetry, aad the whole occupies a space of about three-sixteenths of an inch. Each slide is a cabinet,—a collection in itself,—and is accompanied by a catalogue of its contents. This one is called the 'Type Plate,' and cost $40. The 'Test Plate,' from tbe same operator, contains, set in one row with the most perfect regularity, twenty tests, hy order of difficulty."

Organic Matter in the Atmosphere. The presence of spores in a miasmatic atmosphere may be determined hy means of sulphuric acid, which frees carbon from its combinations in organic substances. If a watchglass containing strong sulphuric acid be exposed to an atmosphere containing such suhstances, it will after a time become blackened by them. This occurs much more readily in malarial districts than in other places.

Prof. Cope on Genera.

The origin of *genera*, according to the idea of Prof. Cope, is in the retardation and accceleration of the developmsut of individuals, at the time whsn development is going on most rapidly; that is, at the approach of mstnrity. The origin of *species*, is in natnral sslection, and tbe gradual modification of tbe preëxisting species. We quote a few sentences from Prof. C's new work upon the subject, which will serve to give an idea of his manner of treating it:

"As one or more periods in the life of every species is characterized by a greater rapidity of development (or metamorphosis) than the remainder, so in proportion to the approximation of sneh a period and the epoch of maturity or reproduction, is the offspring liable to variation. During the periods corresponding to those between the rapid mstamorphosis, the characters of the geaus would be preserved unaltered, though the period of ohange would be ever approachiug." "As the development of the individual, so the development of the genus. We may add, so the development of the whole of organized heings." "The nearest species of adjacent genera are more nearly allied in specific characters than the most diverse species of the same genus." "Like varieties of distinct species are much nearer in shape and appearance than unlike varieties of tbe same essential species."

Two of the six propositions with which he concludes, are as follows:

"Species have developed from preëxistent species by an inherent tendency to variation, and have been preserved in given directions and repressed in others, hy the operation of the law of Natural Selection.

Genera have been produced by a system of retardation or acceleration in the development of individuals; the former on pre-established, the latter on preconceived lines of direction. Or in other words, while nature's series have been projected in accordance with the law of acceleration and retardation, they have been limited, modified and terminated hy tbe law of natural selection, which may itself have operated in part by the samo law."

Akazgia—A New Alkaloid.—At a recent meeting of the Polytechnic Association of the American Institute, was described a new alkaloid fonnd by Dr. Frazer, of Edinhurgh, in specimens of tbe Akazgia plant brought from the west coast of Africa, and which he supposed to be a new species of Strycbnos. Akazgia is a crystalline alkaloid closely resembling strychnia, hut differing from it by being precipitated by alkaline bicarbonates. Travelers report that the natives of West Africa use Akazgia as an ordeal. A supposed sorcerer is compelled to drink an infusion of the bark of this plant and walk over small Akazgia stieks. If guilty, he tries in vain to pass the sticks and falls in convulsions, when he is beaten to death by the savages; but if innocent, the kidneys will act freely and the poison is thus eliminated. Dr. Frazer found certain twigs of the so-called Akazgia of different structure, which did not yield the new alkaloid, and it is probahle that those natives who have escaped from the ordeal, drank a decoction made from this variety.

American Association fon the Advancement of Soience.—This Association will hold its annual meetiag in Augnst next, at Salem, commeuoing on tbe 18th at ten o'clock, A. M. Microscopy will constitute a large part of the scientific matter under discussion. Every one who has a first-class instrument is requested to bring it. A large room will be specially devoted to the display of these instruments and apparatus thereto pertaining. The Association will be invited, on the first day of the session, to assist in the dedication of tbe Museum of the Peabody Academy of Science.

Organisms in the Rocks.—Dr. Jenzsch, of Gotha, who has devoted himself for some years to mieroscopic lithology, anuounces that in various kinds of crystalline and volcanic rocks he has discovered minute animal forms in prodigious numhers in a fossil condition. Among them he finds infusoria and rotiferæ intermingled with algæ, and he infers their formation in a large expanse of staguant water.

Farming and Gardening.

Rust and Smut in Wheat.

A communication appeared some days since in the *Times*, of this city, assnming to correct the *Bulletin* for pronouncing the rust "a vegetable parasite or fungus." The *Times'* correspondent says:

"The parasite is simply the *result* and not the *cause;* it being an *insect* feeding on the juices of the plant that are exuded from the ruptnred stalk, and that by exposure to the air are oxidated, or inspissated on the surface, furnisbing a delicate pabulum for the sustenance of insects, that by an inscrutable law of nature, are generated for such an exigency. When the wheat plant, in a state of maturation is exposed to unusual moisture from rain or fog, it pumps up or absorbs an excess of liquid, so that when suddenly exposed to an increase of temperature from an nnclouded sun, the liquids expand, rupture the stalk, and necessarily cause an outflow of the life blood of the plant. * * * The soaking of the seed wheat in bluestone is not designed to correct the *rust* in wheat, but to prevent the *smut*. Smut is a constitutional disease that is hereditary and tranmissible, and that, like the syphilis and other human diseases, can be corrected by proper medicaments. * * * To repeat, *rust* comes from a repletion of food and subsequent exposure; while *smut* is a constitutional disease, affecting the plant from birth to maturity, but only evincing its impurity in its ripened fruit."

The crude communication, from which we extract the above, having been quite extensively copied and commended as the true philosophy of the rust and smut in wheat, we have thought it might not be out of place to give the more commonly accepted and undoubtedly correct cause of the origin of these pests, often so destructive to the hopes of the farmer.

What are Rust and Smut.

They are in no way due to insect life, either proximate or remote—they are vegetable parasites or fnngi, similar to mildew—and no nearer related to inseots than is the latter well known fungus. Fungi, in their respiratory functions approach to the peculiarity of animal life, inasmuch as they absorb oxygen and exhale carbonic acid gas, instead of absorbing the latter and exhaling oxygen, as most plants do; and, like flesh, they contain a large amount of nitrogen. They also contain a substance, known to chemists as *fungine*—which bears a near resemblance to flesh; bnt which is an universally acknowledged vegetable principle. *Fungi* derive the carbon which entere into their sustensnce from the substances on which they grow, and not from the air, as is the case with most other plants; hence their destructive effect upon vegetation.

Mildew is a characteristic representative of this class of vegetable organisms, and is well known from its universal presence wherever dead organic matter is exposed to moisture; *but it never attacks healthy plants.* Whenever the cuticle of a leaf or the young shoot of a fruit tree or vine is fractured, then some variety of this parasite will promptly settle and take root. It will adhere to any fissure in the stock or blade of wheat or other grain, or wherever any sap of the plant has been forced to the surface.

The varieties of this plant are numerous. *Rust* and *smut* are enumerated among them. The former attacks the straw, and is eo called from its resemblance, in oolor, to the rust of iron. It exhausts the life of the plant by so destroying its juices that it ie not able to mature its seed. Smut generally attacks the grain or kernel; and usually not till after the rust has so weakened the plant that the kernel is thereby diseased and shrivelled, so as to afford proper food for the smut.

The sporulcs, or germs of rust and smut, are exceedingly minute; so very small that it is supposed they often find their way into the juices of the plant through its *stomata*—the breathing holes of the skin. This is inferred from the fact that they are often fouud growing beneath the skin when even the microscope fails to show any fracture. The skin, in such cases, is puffed out into blisters, and finally bursts. Their *usual* mode of attack, however, is through fractured portions of the plant.

What Causes Rust in Wheat.

It is a subject of reasonable inqniry to learn the manner and conditions under which these parasites make their appearance. They are usnally observed when two or more cold, wet days immediately succeed several very warm, bright and dry ones. The stomata of the plants are closed by the bright, dry days, and suddeuly opened by the succeeding wet ones, especially if the moisture commences with warm weather. If the first warm day of moisture is succeeded by a cold day, the plants are chilled while their pores are open. Their vigor is suddenly checked—the plant is sick, and the pestiferous little sporules (which are always flying about and watching for a chance) immedistely enter the neglected door and commence their work of destruction.

The worst species of rust effect a lodgment on the inner surface of the outer chaff scales of the grain, and is of an orange color. When that appears to any considerable extent, the crop is ruined, unless such appearance is immediately followed by long-continued and very dry weather. The botanical name of this plant is *uredo rabigo;* the rust which attacks the straw is called *uredo linearis*. If fair growing weather immediately succeeds the appearance of the last mentioued, the evil is usually dissipated. and a healthy green aspect of the field succeeds.

There is a kind of rust that is very general on the common berberry bush, known to botanists as *erysiphe berberides;* and many farmers at the east are in the habit of carefully grnbbing out this bush from their wheat fields, for fear of its spreading to the grain. There is no danger, however, of such an occurreuce, as it never attacks grain.

How Shall We Gnard Against these Plagues?

The question naturally arises: can we in any way guard against these pests, and if so, how? The best thing, at the start, is to do everything to secure an otherwise healthy growth; for, as we have already intimated, this pest never attacks a healthy plant any more than the common mildew will come to plague a neat and tidy houeekeeper. It is the indolent farmer and the badly-managed field that suffere most. Then let none but the hest and most healthy seed be sown—not to guard against the danger of planting these germs with the seed, and allowing the plant to take them up in its growth. That probably is never done, although it may he possible. But their presence in the plant, even under such circumstances, would most likely be harmless, unless the plant became enfeebled or its tissues broken. But there is no need for securing their presenco hy such means, for the entire atmosphere is always full of them. Millions are always floating over every acre of surface, and lodging npon all parts of the plant; when, if the conditions are favorable, they will be seen to take root. The necessity for good seed is to eecure a healthy and vigorous growth, such as will resist the insidious attacks of these pests. The land should also be in good condition. If dry, plow deep for moisture; if wet, drain; if poor, dress it up to the proper standard.

But if, notwithstanding all precautions, this pest has already made its appearance in emall force, the only thiug which remains to he done is either to dry up the juice which has got out of its proper vesels, and thereby affords a natural food for the rust; close up the pores by which the germs may be entering the wheat leaves or kill the germs themselves. We know of no better way to accomplish these ends than the sowing of wood ashes over the field, at the rate of about eight bushels to the acre. We have heard of good results therefrom. The ashes should be sown while the wheat is wet either with dew or rain. They will at least benefit the next year's crop, even if they fail to help the present. Powdered sulphur has been successfully employed ou grape vines and fruit trees, to kill the mildew *(Puccinia graminos);* and we see no reason why it might not also have equally as good au effect on the rust or smut fungi —unless it may be too expensive. The alkali of the ashes would undoubtedly kill the germs; while the effect of the sulphur would be to absorb the extravassated juices on which the rust lives, and thus starve it out, and possibly also to close up the pores of the skin of the plant, by which the rust germs may be seeking an entrauce to the diseased juices within.

Soaking the seed in a solution of blusstone, lime or salt will undouhtedly he beneficial, not in killing the germs of the rust, as snpposed, but in killing animal germs, and in otherwise promoting the growth and healthiness of the plant. Soaking in pure water is better than nothing, as by that means the poor seed, which, by prodncing unhealthy plants, invites the rust, is readily removed by being skimmed off. Stir and skim your seed until the light nnhealthy grains are all removed. Such a course will he fouud altogether preferable to either winnowing or separating.

Surprise Oats.

Can any one of the readers of the *Farmer* tell where thsse oats originated? I see that packages of them are heing sent to this State through the mail. Are they better than the *Norway* oats? Will some one that knows please answer.—*Cor. Willamette Farmer.*

The "surprise oats" originated some seven or eight years since, on the farm of Mr. Van Olinda, of Sandwich, De Kalb County, Ill. Mr. Van Olinda says that he found a single head of oats in his *wheat field* which strnck him as differing from any grain which he had ever before met with. There were but seven grains on the stalk; five of these were planted the succeeding season, and from them has originated the present supply.

The plant first oheerved, was no donbt some variety of wild oats, which had never before been snbjected to cultivation; but which, on being brought under careful culture, has been developed into a very valuabls grain. The varietiss of oats which have been observed and named, already reach about seventy in number, and are constantly increasing.

The eurprise oats present many valuable characteristics. They are described as remarkahle in size, weight and beauty—weighing nearly as much as barley—from 40 to 46 pounds to the bushel. Some of the Chicago brewers, who have tried them, say they malt excellently well; better than any other variety of oats. It is claimed that they have yielded as high as 125 hushels to the acre, on ordinary wheat land, in Illinois. They are said to be two or three weeks earlier than ordinary varieties. Two years ago Van Olinda was selling them in packages of two quarts, (tbe smallest package put up by him) at the moderate sum of $5; or $40 per bushel! We do not know how they are selling at this time; hut it appears from the above correspondence of the Willamette *Farmer*, that they are being forwarded to this State, in emall packages, by mail, which mode of transportation would indicate a pretty high price for the grain. Those who have examined them, generally pronounce favorably with regard to their value; although some speak indifferently of them. We will endeavor, next week, to make some extended remarks on the importance of the cultivation of oats in this State, and answer the fnrther query relative to the Norway oats.

Squirrels and Gophers—How to Destroy Them.

The accelerating increase of these destructive vermin is a matter of no little importance to the farmers of California. Various remedies have been proposed to get rid of these pests, but, as yet, with very little euccess. The *Bulletin*, of Thursday, in reply to a correspondent, who asks how to use phosphorus for this purpose, gives some directions which may be as dangerous to the farmer as to the squirrele. We will suggest a safer and better process, as follows:

Warm a ponnd of hog's lard, so that it will run; pour it into a bottle and add half an ouuce of phosphorus and a pint of proof whisky; then cork and immerse the same in water a little below its boiling point—say 150 degrees. Allow it to remain until the phosphorus has dissolved, (being careful to keep the water below the boiling point); then remove and agitate the bottle until its contents become intimately mixed, and forms a milky-looking fluid. Cool and pour off the spirit, and you have a fatty compound, which, after being again gently warmed, may be readily incorporated with a mixture of flour and sugar to the consistency of a stiff dongh. Make np into little pellets and place conveniently for your enemies. Being slightly Inminons and extremely palatable, they will readily partake of it to their certain death. For rats, especially, the preparation will be much more attractive by the addition of a little oil of rhodium, or oil of annise seed. Put a vessel of water near by, and the vermin will immediately go to it and generally die before they get away; thus about a house the carcasses can he easily disposed of, so that they will not constitute a nuisance.

If you fear it may be eaten by cats or other nseful animals, make a small box, with an opening in both ends, just large enough for the squirrels to enter. They will not hesitate to enter wben they can see their way out, especially with such a tempting bait before them.

A Haywood correspondent of the *Bulletin*, of last week, gave a very good method for destroying squirrels, when all other means fail, which mnst be very effective and quite unattended with danger, althongh somewhat tedious. We copy as follows:

Take a piece of cotton cloth six inches long and three inches wide, dip in coal oil, then cover the cloth on one side with fine sulphur; double the cloth lengthways and again cover it with eulphur; then roll the cloth around a sharp-pointed stick, set fire to the cloth and pnsh it down the squirrel hole as deep as possible, and immediately cover it up tight by putting—first, over it a lump of dirt, and then bank it with fine soil. After a few trials parties will discover the proper time to pnt the lighted cloth into the hole. In one case out of forty holes, but five were again opened.

Birds, Bugs and Berries.

The Boston *Journal of Chemistry* euggests that the law in Massachusetts relating to the destruction of robins and some other birds, be euspended for some three years or so. The editor says that last year he lost all his cherries, and Delaware grapes, and most of his etrawberries; and insists that all the eentimental and delightful essays upon the impolitic, as well as cruel, killing of birds by farmers and orchardists, is *humbug.* Calculations have been made somewhat in this wise: "If one robin will eat three pounds of raw worms in twenty-four hours, a sufficient number of robins would eat all the worms,—and consequently, of conrse, preserve all the fruit." Now the joke of the thing is,—he says,—that a man never finds a worm in the crop of a killed rohin in the frnit season, but does find any qnantity of cherries and strawberriee, and such like delicaciee.

Let the California fruit grower congratulate himself upon his comparative immunity from the thousand and one nnisances which destroy the hopes and the grapee of New Englanders. The evil is not yet come; and it may he long deferred by careful watching. Look out for the first caterpillar. Get "Packard on Insects,"—jnst published under the anspices of the Essex Inetitute. Acquaint yourself with the look of every insect in its every stage. Some of these you wish to preserve; they are your friends,—for they war npon the others, which are your enemiee. It ie plainly of the highest importance that yon be able to distinguish hetween these two classes. By keeping yonr eyes about you, and your friends posted, yon may succeed in keeping many of the worst of the nnisances out of the Pacific States entirely.

In regard to the birds, we may add, that for ourselves, we desire to study the snbject farther, before pronouncing a sweeping denunciation against the whole tribe. Although it may be true that during the fruit season, they feed upon choice fruit, it may also be true that some of them at least did all they could, in the earlier months, to secure for us, and for themselves, that frnit, by feeding upon the earliest germs of that piratical horde which would otherwise have destroyed it utterly. If this he so, the least we can do, in common justice, is to divide the crop with them; and thus by letting the birds aloue, kill two birds with a single stone,— *i. e.* we may gratify our kindly feelings for the "charming little sougsters," and at the same timo savo half our cherrics.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

San Francisco, June 26, 1869.

Financial.

There is no disguising the fact that our local money market is somewhat stringent, although no difficulty is experienced in making loans for legitimate purposes on acceptable paper, at 1¼@1½ per cent. per month; but speculative designs are frowned down, their projectors being compelled to submit to harder terms. When gold took its last upward flight in New York large amounts were forwarded from here to secure the premium; but it may be doubted whether the operation was wise. It is true that merchandise was purchased and placed in this market at greatly reduced figures; but the market was bared of coin, and the stringency which succeeded exerted such a depressing effect upon business that the bulk of the goods remained on hand, while the increased rates of money more than counterbalanced any temporary advantage gained by heavy treasure shipments to realize the premium paid on gold at the East.

Although the new crops are commencing to make their appearance we learn of no concerted attempt to market them, nor does there appear to be any great demand for money to move them to the seaboard. It is generally believed that the financial pinch experienced for several weeks has gone through its worst stages. Cases of individual tightness cannot be held as indicating the actual condition of the market; but, like all news of an unpleasant character, they create more remark and produce a sense of uneasiness for which if a reason were demanded none satisfactory could be given. It is very certain that business is being done on a sounder basis, and although we learn of no very marked or noteworthy transactions, the character of that which is done is more satisfactory. At all events, we are, and have been, in a far better condition, financially and commercially, than the people at the East.

The Commissioners of the Funded Debt of the City of San Francisco have submitted their eighteenth annual report to the Board of Supervisors. From it we make the following summary:

Amount of Bonds outstanding at the date of last report, June 4th, 1868 ..... $1,189,200 00
Redeemed during the past year 600 00

Leaving outstanding on the 31st ult. $1,188,600 00

These bonds become due on the 1st of May, 1871, previous to which there will be required from the City Treasury the sum of $237,720, to meet the balance of the interest accruing upon them. Of this amount $118,800 falls due the present fiscal year. The financial operations of the Board during the past year leave a net gain to the city, after deducting all expenses, of $117,330 97.

The Sinking Fund on the 31st ultimo amounted to $1,226,349 20. It is made up of the following items, the stocks owned by the Board being set down at their cost:

Loans on Stocks and Bonds	$ 193,920 00
Loans on Real Estate	86,330 00
$219,500 S. F. 5 per cent. Bonds	120,545 50
$239,000 S. F. 7 per cent. Bonds	169,089 13
$45,000 Santa Clara County 7 per cent. Bonds	31,625 00
$11,000 Santa Cruz County 10 per cent. Bonds	10,450 00
$6,203 73 State Controller's Warranta	5,300 00
$3,000 M. R. R. Bonds (Page, Bacon & Co.)	2,464 15
Cash on deposit with Parrott & Co	13,045 21
Total	$1,232,779 99
Interest due on Loans and Investments	13,249 21
	$1,246,029 20
Less Coupons due but not presented	19,680 00
Available Sinking Fund	$1,226,349 20

Statement of receipts and disbursements, outstanding loans, etc., of the Commissioners of the Funded Debt of the City and County of San Francisco, from June 1st, 1868, to May 31st, 1869, inclusive:

Balance of cash on hand per statement of May 31, 1869		$ 11,771 90
Loans outstanding at that date		763,530 00
Stocks taken to account		340,635 98
Real estate taken to account		1,158 20
RECEIPTS—1868-69.		
City Treasurer—Requisition 1868-69	$118,920 00	
Interest	127,278 24

Rent of lots	1,200 00	
		252,443 94
Total		$1,369,540 02
DISBURSEMENTS.		
Interest on Bonds	$ 121,905 86	
Bonds redeemed	600 00	
Attorney's fees	2,400 00	
Salaries of the Board of Commissioners (including an amount due the Commissioners of 1857-58) clerk hire, office rent, advertising, awards of land, notarial fees, etc	13,792 97	
	$ 138,698 83	
Loans outstanding at this date, to-wit:—On Stocks and Bonds	$793,930 00	
On Real Estate	89,300 00	
Stocks taken to account	337,535 98	
Cash on hand, deposited with Parrot & Co	13,045 21	
		1,230,841 19
Total		$1,369,540 02

City Stocks.

In miscellaneous securities no sales of importance have been made during the past week. Early in the week San Francisco Gas stock realized $79 75 and Spring Valley Water $65@64 25 per share.—The par value of the stock of the California Insurance Co. has been changed from $1,000 to $100 per share, the shares now numbering 3,000 instead of 200 as heretofore. At the close, we note sales of Spring Valley Water at $64 25@64 50 per share, and California Steam Navigation at 60 (buyer 3) per cent.

The returns of our local insurance companies to the Internal Revenue department for the month of May and previously this year have been as follows, upon a currency basis of 74 cents on the dollar for the month of January, 77⅛ cents for February and March, 75½ cents for April, and 73½ cents for May:

	May.	Previously this year.	Total.
Pacific	$109,193	$383,464	$492,657
Union	41,881	183,877	225,758
Fireman's Fund	47,480	115,917	163,397
California	9,448	43,211	52,659
Merchants' Mutual Marine	28,381	103,153	131,534
Occidental	25,582	83,225	110,807
Home Mutual	12,258	54,539	66,797
Peoples'	16,895	60,701	77,596
Total	$291,118	$1,030,087	$1,321,205
Same time in 1868	156,028	670,596	826,624
Increase in 1869	$135,090	$359,491	$494,581

The above statement shows an increase of $4,003 over the receipts in April. The receipts of the several companies in May as compared with April show the following difference:

	Increase.	Decrease.
Pacific	.....	$1,199
Union	.....	6,900
Fireman's Fund	$24,536	.....
California	.....	688
Merchants' Mutual Marine	.....	7,462
Occidental	.....	1,898
Home Mutual	.....	913
People's	.....	1,653

The receipts of the city railroads for the month of May and previously this year were as follows:

	May.	Previously this year.	Total.
Omnibus	$27,456	$92,906	$120,362
North Beach & Mission	26,824	89,998	116,822
Central	19,192	60,695	79,887
Front Street, Mission & Ocean	10,849	34,037	44,886
Market Street	14,598	43,183	57,781
Potrero and Bay View	3,872	10,255	14,127
Totals	$102,601	$331,064	$433,865
Same time in 1868	86,201	292,622	378,823
Increase in 1869	$16,400	$38,442	$54,842

As compared with the total receipts in April, we find a gain of $9,496. The receipts of May as against April show the following difference:

	Increase.	Decrease.
Omnibus	$1,517	.....
North Beach and Mission	1,773	.....
Central	2,039	.....
Front Street, Mission and Ocean	1,172	.....
Market Street	2,343	.....
Potrero and Bay View	652	.....

Mining Share Market.

With regard to mining stocks, the volume of transactions has been considerably lessened; however, during the week under review, the sales partook somewhat more of a legitimate character, and were it not for the continued tightness of the money market operations would be greatly extended. The business in White Pine stocks is on the increase, and the sales now making are quite large.

In the opening remarks of an extended review of the White Pine mines for the week ending June 19th, the *Daily News* says: "In our rounds we also gathered statistics for which we have no room here, and ascertained from actual observation that Treasure Hill now employs 1,463 miners, who extract 435 tons of good milling ore daily, and that the supply of ore now lying upon the various dumps awaiting milling facilities amounts to 4,171 tons. According to milling tests of fair samples of this ore it yields under stamps from $100 to $600 per ton. We have shipped this week $65,078 63, and, with the ore on dumps and at the mills, we have about $1,500,000 left."

Gould & Curry—sold to a less extent than last week, and at declining rates. During the week ending June 21st they extracted 283 tons of ore and forwarded 373 for reduction, leaving 297 tons on hand. Most of the ore extracted was taken from below the main adit level. Stopped sinking of shaft on the 17th. The 7th station sills will be 1,162 feet and 7 inches below the top of the shaft, and together with the sump, which is 20 feet deep, makes the total depth of shaft 1,182 feet and 7 inches. At various points in the mine prospecting is carried on, and encouraging indications are constantly met with. So far for June account $31,966 in bullion has been received.

Hale & Norcross—was in the market at rather fluctuating rates, but at the close exhibited some improvement. On the 22d they were retimbering the air passage on the fifth level, from cross-cut No. 5 to its point of connection with the Chollar-Potosi works, which would be completed in a few days, and then will commence to cross-cut and explore the vein in the south half of the mine. In the upper mine the 175, Santa Fé and 300-levels are well opened, and are said to show large bodies of ore, which they are ready to remove in almost any desired quantities. During the week ending June 19th the upper works yielded 131 tons of ore, and the lower works 1,011. In the same time 1,243 tons were delivered, leaving 1,281 on hand.

Chollar-Potosi—has maintained itself quite well during the week. For the week ending June 18th we have an ore yield of 1,762 tons, viz: New Tunnel, 747; Blue Wing, 696; Croppings, 180; Potosi, 139 tons. Sample assays show averages of $132 to the ton. No change since last week in the Blue Wing and New Tunnel stopes. In the Potosi branch drift to the Grass Valley deposit considerable ore has been found as the work is carried forward. The new shaft developments show porphyry and quartz, and at the 1,100-level the drift to connect with the Hale & Norcross has been carried ten feet over the line.

Imperial—sold moderately at declining rates. On the 22d inst. the Imperial-Empire shaft was 49 feet in depth below the 1,100-level. The bottom of the shaft is in hard porphyry, with a small increase of water and no indications of ore. The drift going south is in 117 feet south of the shaft, and is running in the "east country." They are extracting about 60 tons of ore per day from the Alta mine. On the 23d forwarded $7,428 in bullion.

Amador (Cal.)—sold at $280. Datea of the 22d state that the Badger drift had been extended north some 12 feet—the ledge in this drift showing 5½ feet of ore worth $45 per ton. The new south shaft has been sunk 18 feet, carrying a vein 16 inches wide, which is gradually increasing, the ore being worth $18@20 per ton.—Ophir drift is in 379 feet.

The Telegraph in China.—The wires for the telegraph between Canton and Shanghai, is nearly ready for shipment. The line will probably be in working order during the present year. A line is already far advanced through the Mediterranean *via* India to China, which it is proposed to connect with the Canton and Shanghai. When both these lines are completed, San Francisco will be in telegraphic communication with China. A still further extension to Japan will be a matter of course.

Hydraulic Cement—Supposed Valuable Discovery.—The Honolulu *Gazette* reports the discovery of what is described as a valuable fire-proof, hydraulic cement. It is formed of volcanic ash from the volcanoes of Molokai, and the Hawaiians expect to find in it a new and important source of commerce.

U. S. Bonds in Europe.—The London *Times* says that the amount of United States bonds held in England is $750,000,000. A correspondent of the New York *World* states that the total amount of United States bonds held in Europe reaches $1,400,000,000.

An Absolutely Pure Stimulant.—Ask any analytical chemist who has tested the comparative wholesomeness of distilled liquors, and he will tell you that St. Croix Rum is the purest of them all. This matchless stimulant is the only alcoholic element used in the manufacture of Plantation Bitters—and mark this: it is not the St. Croix Rum of commerce that is so employed, but an article made from the sugar-cane by the agents of the proprietors of the Bitters, on their own sugar estates at St. Thomas, and far superior to any rum obtainable in the general market. Medicated with the finest Calisaya Bark (also gathered and prepared by the employees of the firm in South America), and other rare vegetable curatives and restoratives, the Plantation Bitters are in all respects the best tonic, alterative and regulating preparation ever compounded for the use of man.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

Globe.—*Miner*, June 12th: Tunnel extended eight feet this week; total length now, 234 feet, and rock working favorably.

Mountain.—Tunnel now in over 1,600 feet.

Suspended.—Operations on the Michigan, otherwise known as the Indian Chief tunnel of the Alpine G. & S. Co. When Mr. Alison arrives from London and pnts an end to backbiting here, work will probably be resumed.

M. C. M.—This company having tested the Boston machines for converting quartz into fine dust and found them np to the work, will proceed with the finishing the mill as fast as practicable.

Pennsylvania.—*Chronicle*, 12th: After four years' hard work the Pennsylvania boys having proved the valne of their ledge, have been rnsticating during the past three weeks, but are at work again, drifting south.

AMADOR COUNTY.

Oneida.—*Ledger*, Jnne 19th: Wo lsarn that it is the intention of the owners to sink both shafts to the depth of 800 feet, immediately. This is wise. It proved to be the case in the Hayward mine, and the Oneida is on the same vein.

Machinery.—On Monday several tons of machinery was received at Latrobe for the Amador and Summit mines, at Sutter Creek.

BUTTE COUNTY.

Mining Dam.—Oroville *Record*, Jnne 19th: The Messrs. Young and others are making preparations to put in a wing dam opposite the town. Mining operations along the river have changed the channel somewhat, and the boys are going after the old channel during the present summer.

Mountain Spring.—Letters to same: Moure & Stewart, three miles below the Hill, did well. They had water about two months and clean up about 300 ounces. Drake & Davis' claims, at the head of Cascade, didn't do much, as they failed to get their tunnel done in time to use much of the spring water. But it is only a question of time with them, as they have thousands of acres of undoubted richness. The parties opening Lower Cascade Valley have commenced operations. The work is carried on by Captain James Owens. They think that it will cost them $12,000 before they get returns. They started the arastra at the Barranco miue this week. Squire Woodman is workiug a gang of Chinamen in the river just below Stringtown.

CALAVERAS COUNTY.

Petticoat.—*Chronicle*, June 19th: At the depth of 190 feet in the new shaft, a wide lead of first quality ore has been struck. The shaft will be sunk a considerable distance further before commencing to take out rock in quantities.

Palomo.—Affairs are progressing favorably at this mine. An average of 30 tons per day is being crushed. At a depth of 200 feet the ledge has increased to seven feet in width, and the quartz improves as they descend.

A Rich Strike.—Tullock & Co., from Knight'e Ferry, have been opening a very promising quartz vein half a mile from Copperopolis. The lode is large and well defined, varying from three to eight feet. The ore will pay from $10 to $40 per ton.

New Discovery.—We are informed that a lead of gold-bearing gravel, said to be very rich, has been discovered near the Mokelumne river, abont 15 miles above West Point. The partiee who have located the first claim are Messrs. Eproson, Hoskinson & McDonald.

INYO COUNTY.

Cerro Gordo.—*Alta* correspondence, June 17th: "New discoveries of rich and extensive deposits of silver ore are being made every day, and the hum aod bustle of our camp is increasing. Belshaw & Elder's furnace is still running, and turniug out the bullion faster thau it can bo carried away. The Mexicans are running small vasos. No oros are worked here that pay less than $200 per ton, and all the ores average over $400 per ton. The San Ignacio mine averages over $800 per ton, the St. Lucas, Belmont, General Rathbone, and a hundred moro will assay from their croppiugs more than the average of the best at White Pine."

KERN COUNTY.

Kernville.—Havilah *Courier*, June 15: The mill at this place is pouuding away, and with tolerable success.

MARIPOSA COUNTY.

Mariposa Mine.—*Mail*, Juue 18th: This mine is now in good working order. The water has all been pumped out, and the drifts securely timbered. The miners are taking out quartz, and in a short time our ears will be greeted with the sonud of the whistle.

Hornitos.—*Gazette*, Jnne 18th: Mr. Dyer is going to commence work on his vein on Quartz Mountain in a few days. This vein has not been worked in several months. It is his intention to use Giant Powder and thoroughly prospect it.

NEVADA COUNTY.

Mining Situation.—Grass Valley *Union*, June 16th: The stopping work at the Empire does not make the mining situation cheerful, and it is possible that other mills will hang up. Night before last the hands at Allison Ranch were paid off and discharged, but not with any intention at present of stopping work. Contracts will be let for carrying on work. The Hope Gravel Co. is drifting for the lead, and it is pretty certain that the old river bed will be found in a day or two. The strike still maintains a solid front and various reports to account for the firmness of the strikers, are current. One of theso has it that assistance to the leaguers has been furnished from San Francisco, by parties interested in powder. The report is probably a false one.

Union Hill.—The mill is in successful operation, and the rock paying well—the ledge now larger and rioher than it has ever been.

The Eureka.—Same of 20th: It has been stated that the Eureka mine would stop taking out rock to repair the shaft and to timber up the drifts. Mr. Watt, the Supt., informs us that no decrease of working force will be made. The mine is arranged so that repairs can go on at the same time regular work is being done.

Bald Mountain Ledge.—*National*, 14th: This ledge is near Eureka South, 35 miles from here. The ledge is three ft. in width, cased in slate, and well defined. A tunnel has been run in 50 ft. We saw a piece of rock weighing a pound prospected, and not less than $1 in gold was the result.

Idaho Mine.—Same of 18th: For the past two weeks work has been hindered by foul air. The difficulty has now been obviated by a draw pips from the 200 foot level to the top of the hoisting works.

West Idaho.—A tunnel has beeu run in 120 ft. whioh struck the ledge, and on Wednesday they started to sink. The ledge is two ft. wide, rich in sulphurets and galena, and shows free gold.

Gold Hill Mill.—The mill is now crushing boulders from the Slide near town, and quartz from Deadman's Flat and other localities. All the rock pays well.

Allison Ranch.—Same, 19th: A party of practical miners have taken a cootract to take out rock from the Cariboo ledge, at the south end of the Allison Ranch mine. The owners of the mine furnish every thing, aud the coutractors or lessees pay them a percentage of the yield of the rock. About 25 men will be furnished employment.

Purchase.—*Gazette*, 18th: The Banbury aud Stacy ledge, near Eureka, has passed into the hands of Black, Irwin & Young. One-half was sold for $4,000. Black & Young's mill is crushing rock from this ledge, which pays well. The ledge is large, well dcfined, and the entire cost of taking out rock and crushing it does not exceed $5 a ton. The rock is in a partially decomposed state, and their 10-stamp mill is able to reduce 25 tons every 24 hours.

A Good Move.—Cornishmen, recently of the Banner mine, have made arrangements to erect a quartz mill on a ledge at Washington. They are to have half the ledge for putting up the mill and machinery.

The Prospects.—*Transcript:* Though times are dull the prospects are exccllent. In the district on tho Yuba above Washington, a party of experienced miners who would not work with Giaut powder will put up a mill and test the valne of the ledges. At Diamond Creek, Mr. Singleton is working a good mine. Eureka is a lively camp; a large amount of prospecting is boing done. At Mooney Flat, compauies have gone to work with ample capital to open the rich pay channel which connects the rich cement heds of Smartsville with the channel on the ridge. The miues along the ridge are payiug well, and the North Bloomfield Gravel Co. are investing large amounts to open their claims and complete thcir ditches.

Meadow Lake.—Truckee *Tribune*, June 19th: Mr. A. Friedmau, of this place, visited Meadow Lake a few days since, aud from him we learo that the majority of the houses have been crnshed in by tho snow. Not more than ten or a dozeu families are now there; but the few are as sanguine as ever that the mines are good and will yet be proven so. Mr. F. witnessed the working of some ore by the Burns process. The rock is desulphurized and decomposed by some process which takes about six hours, and can then be pulverized in the hand, no matter how hard the rock may have been. The gold is left bright, and can be readily separated by ordinary pan process. The estimated cost is about $5 per ton. The process has been patented. Mr. F. thinks that a reactionary flow will soon set in towards Meadow Lake.

PLACER COUNTY.

American Falls Mining Co.—*Herald*, June 19th: A company under the above name existed here for many years and spent $80,000 in endeavoring to drain and work Murderer's Bar on the Middle Fork of the American River, near its junction with the North Fork. An attempt was made to blast out the bsdrock forming the Falls, and open a channel deep enough to drain the entire bar and bed of the river, but from some cause the company failed to succeed. A company is now sinking on the npper end of the bar, using water-power for pumping and hoisting, and contemplate drifting on the bedrock.

Colfax.—*Stars and Stripes*, June 17th: Tho Rising Sun mine is agaio in a prosperous condition. The proceeds of a week's crushing lately amounted to $1,100. The company are sinking their main shaft for a more permanent ledge. The Ranger Co. have been running a tunnel for a year, which, when completed, will strike the ledge 200 feet below the snrface. There was some rock shipped from McCaffery's claim to a mill in the vicinity of Ophir, to be orushed. The parties who crushed it offered to buy 200 feet in the ledge.

SISKIYOU COUNTY.

Klamath Quartz Ledge.—Yreka *Union*, 19th: Since operations have been resumed, a tunnel has been run 60 feet, when a lode of quartz from four to eight feet in thickness was struck. The quartz is of excellent quality.

Hardscrabble.—We understand that Lieut. Harry Mathewson's Hardscrabble claim is paying handsomely at present—netting about $200 per wesk.

SIERRA COUNTY.

Cleaned Up.—Downieville *Messenger*, June 19th: The result of the crushiug of 100 tons of Ned Lsonard's rock was $8 per ton. Nearly all of this was from a spur of the main ledge. That crushed at the Gold Bluff mill was from the main ledge.

TUOLUMNE COUNTY.

Brown's Flat.—Souora *Democrat*, June 19th: We learn that several of the claims are doing well. The old Mississippi is doing a large business.

Confidence Mine.—This well known mine having been tested sufficieutly to satisfy the owner of its richness, this week a commencement was made in building a 20-stamp mill.

YUBA COUNTY.

At Work.—*Appeal*, June 17th: The Pennsylvania mill at Brown's Valley, which has been silent and quiescent for over two months, commenced crushing yesterday with 16 stamps.

ARIZONA.

Wickenburg.—Prescott *Miner*, June 5th: Parties ioform us that both mills are running, and times quite brisk. Great improvements have beeu made at the mine. The Vulture Co. have a whim for raising ore. Mr. Taylor, foreman of the mine, talked of going to Scotland, for steam wagons, to be used in hauling the ore from the mine to the mill. J. D. Cusenbary, and Mr. Phelps, were expected to arrive shortly.

Walker's.—The old camp bide fair to become again the busiest in the mountains. Bowers & Wells have commenced digging ditches, making reservoirs, getting out timbers, blocks, etc. They have in their employ 20 meu.

The Sterling.—Monday was pay day. Mr. Wnuderlich disbursed about $3,000. The number of mon employed at mill and mine is 35. The lode is splendid. A whim to hoist ore is nearly completed. The now battery will soon be in position.

Montgomery.—A man from this mine on the Hassayampa, brought in some very rich pieces of rock. The arastras were almost completed when he left.

COLORADO.

Bullion Shipments.—Central City *Herald*, Juoe 9th: The shipments of gold and silver per Wells, Fargo & Co., for April, foot up $127,071, aod for May, $156,930. These figures are approximate, and show a healthy increase over the true shipments of corresponding months last year. We feel warranted in stating that the mines of Gilpin County are now producing over $200,000 per month.

A Comparison.—The *Herald* quotes the published yield of several White Pine mines, and adds: "We can show as rich ore as White Pine, but not a chloride ore, and not so easily converted into cash. The Terrible and Equator are now producing ore which nets the owners $800 per ton, after paying the expenses of ssnding it to New Jersey."

North Empire.—*Register*, 10th: Robert Jones rsports mining affairs as flourishing. The Disbrow boys are about putting a pump into their mine on the Conqueror.

Williams & Sullivan had four cords of ore from the James lode, Nevada, crushed, which yielded ninety ounces of very pure gold bullion.

Bullion.—The shipments of bullion have, for the first seven days of the month, amounted to $70,000.

Jones Lode.—Yesterday we fonnd Messrs. Sullivan & Andrews raising rich ore, at the rate of a cord per day. They are down 50 feet, and have a vein of pay ore eight to twelve inches wide, which yields, undor stamps, an average of 25 ounces per cord. One load of several cords last week yielded 26¼ ounces.....On the same lode, Dee & Ganley are taking ont ore of the same general character, though not quits as rich. They are down 30 feet, and are raising a cord a day, which yields 14 to 16 ouuces.

Spring Gulch.—There are two mills running, McIntyre and Montana. The former, leased by John Young, is crushiug ore from the Alps aud Roderick Dhu. The mill has 24 stamps and two Freiberg pans. They are crushing about 14 cords per week. The Montana mill, John Schellenger, is crushing dirt and rock from the Patch, on Quartz Hill. He is running 20 etamps, and gets through 35 cords per week, obtaining two ounces per cord.

Baker S. M. Co.—Georgetown *Miner*, Juno 10th: The large reduction works of this company will be completed about the first of July. William H. Crawford will purchase ores. Col. Baldwin, Capt. Dickerson aud several parties will commence mining in Daily next week. The workmen on the Baker mine have struck a large deposit of solid mineral nearly three feet wide.

Items.—Mr. Watson commenced smelting at the Brown Co's works on Monday. ....A. C. Smith & Co. are developing some fine lodes on Sherman Mountaiu.....The crushing and dressing works are rapidly approaching completion....The Baltimore and Colorado tunnel was in 90 feet on Saturday.....Crow & Clark will commence shipping their first-class ore, from tho Terrible lode, to Newark, New Jersey, for reduction....The Equator lodo cootinues to yield a large amount of sccond-class amalgamatiou ore, as wsll as considerable first-class.

IDAHO.

Flint District.—*Tidal Wave*, June 11th: L. J. Swart and Dan. Edwards are pitching into the Leviathan mine, and will start Black's mill on the ore in about four weeks.

Red Jacket.—Same, 15th: Charles S. Miller of Dalles, Oregon, will immediately commence developing the Red Jacket mine on War Eagle Mountaiu. He has other locations both here and in Flint, that will be attended to in due time.

Nortaern Idaho.—Same, 18th: The Moose Creek mines have been almost abandoned for want of water to work them. Reports are not favorable from Warren's Diggings.

MONTANA.

Crow Creek.—Helena *Post*, June 4th: Times lively. Five hydraulics are run with good results. In all about 40 claims are worked, yielding good average pay. Plenty of water is reported.

Sterling.—The Sterling Co. with 17 men, clean up large. Mesler & Co's ditch is completed. Fletcher & Clark are mining extensively. Dr. Stafford is hydraulicing. Gilbert & Co. have a ditch from Willow Creek upon Gold Run, about seven miles. Quite a number of men could obtain constant employment at good wages. Taken all together, the prospects are flattering.

Blackfoot, etc.—Water short in prospect, but a large number of miners at work. At Deer Lodge only three hours' supply of water in the 24.

Gold.—We noticed yesterday at Bohm & Aub's bank a gold brick, weighing 1,039 ozs.—coin value $18,547.69; currency value $26,000. Another was valued at $7,000. In Hussey, Dahler & Co's was another of $14,000. All these bricks were made from gold taken in at two of the banks in Helena. During the month of May, Wells, Fargo & Co. shipped from Helena, 30 per cent. more gold bullion than during the corresponding month of 1868.

Lincoln Gulch.—There are about 35 claims being actively worked, and all pay

well. On Nos. 5 and 6 there was a dump of dirt, the result of last winter's drifting, and on last Saturday from this dirt, one man with a shovel cleaned up 84 ozs. The upper drain ditch company is working from 25 to 30 hands, and average some $17.50 to the hand.

VIRGINIA CITY.—About 30 miners are at work in Rochester Gulch. Alder Creek is lively. Washington Gulch is creating some excitement.

ANOTHER BRICK.—Same of 11th: Bohm & Co. ran another gold brick yesterday, weighing 900 ozs., and amounting to about $23,000. This is the result of one day's purchase of gold dust.

WATER SHORT.—Reports are unfavorable from Reynold's City, Deer Lodge, and Blackfoot.

RADERSBURG.—Blacker & Keating ran some quartz through an arastra, the other day, which yielded $96 to the ton.

BANNACK.—The Pioneer Ditch Co., after hydraulicing two weeks, cleaned up $3,000 in gold. White & Co's Ditch Co. netted $7,000 in gold from a little over one week's run with two hydraulics. Frank Gregory and others own a hydraulic which they are working with satisfactory results. The greater part of the water comes from Horse Prairie Creek. On this extensive preparations are made for mining this summer. Geo. Yearing expects to run five hydraulics. Almost every claim around Bannack is being worked, and there will be more gold taken out than any year before. Mr. Clark has, at the end of the railroad, a five-foot turbine wheel, by which he will run 20 stamps at little expense. Butterfield & Hopkins mill will be started at once.

NEVADA.

NYE COUNTY.

About 60 miles southwest of Austin, in Mammoth district, and half a mile from the village of Ellsworth, in Nye County, the Ural S. M. Co. have a location of six mines, known respectively as the Vernon, Adrian, Oakland, Gould & Curry No. 1 and 2, and the Ural lodes, and comprising an aggregate of 5,200 ft. Mill workings from the Ural and Gould & Curry No. 1, have yielded respectively $66.75 and $131.93 to the ton, while assays of small quantities have often exceeded that amount. The company having fully satisfied themselves with regard to the value of their property, are now making arrangements to put up a mill upon the same, and commence active mining operations. It has been organized on a capital basis of $1,000,000. Their principal office is at Owego, N. Y., and the company is chiefly made up of men who mean business, and who have gone into the same as a legitimate mining enterprise. The Superintendent is Chas. E. Gillett, of Ellsworth, Nev.

HUMBOLDT.

WHITE CLOUD.—The *Alta* of the 17th, gives a letter from this point. We quote: "I have examined four newly discovered lodes that look as well as the best in Owyhee; some of them bear a strong resemblance to the Comstock lode. If I am not greatly mistaken, this district will become one of the most important in Nevada. The facilities for working the mines are better than I have seen in Idaho or Nevada. Water, grass and timber are abundant, and they are very essential to successful operations in Nevada mining.

Prospecting seems to increase. Parties are scouring the hills with pick and shovel, in quest of new lodes and not a day passes without striking something.

The ledges appear to be well defined and easy to work. The White Cloud is the widest, and one of the best we have ever seen.

This is one of the most healthy localities in Nevada, and a pleasant place to reside in."

COPE DISTRICT.

It is not an easy matter to learn the truth in regard to this new mining field. We give two clippings in reference to it:

Grass Valley *Union*, 20th: Mr. Gibbs informe us that there is no reason for any excitement about the new district, and that there is no sense in a rush. There are two ledges which assay well in silver, and contain some gold, but the extent is not yet known. Mr. Gibbs left the Cope District Thursday, and is certain that as yet no one knows whether there are extensive deposits of precious metals there or not.

Elko letter of date June 14th, to the *Enterprise:* "The opinions concerning the new mines, of persons returning from them, vary. Many assert that the reputation of the place is based upon a rich boulder found by Col. Drew's party, which is not surrounded by any other indications of the great ledges talked about, and that the placer diggings are purely mythical. Notwithstanding these reports, crowds leave this place daily. Some fine specimens of quartz are brought back, but when one tries to ascertain where they were discovered the specimen-carriers are singularly reticent. The country is described as one of the most beautiful in the State, and well watered."

REESE RIVER.

SILVER PEAK.—*Reveille*, June 19th: We are indebted to B. B. Stansbury, just returned from Silver Peak, for information in regard to the Great Salt Basin Co. The mill is now in perfect order and runs to a charm. It has 30 stamps and crushes and amalgamates 45 tons of ore daily. This is furnished by the famous Red Mountain mine. The amount of gold ore which this mine is capable of yielding, appears to be without limit—not less than 15,000 tons now lying at the mine. The ore is brought from the mine to the mill, a distance of seven miles, in two huge wagons, each drawn by 12 mules, over a railway track laid for the purpose. These mammoth wagons carry 22½ tons of ore each at a load. The forward spindles are 3½ inches in diameter, and the hind ones four inches, the box being 18 feet long. Mr. Stansbury thinks the bullion shipments of the company reach in the neighborhood of $20,000 per month.

Some 40 miles south from Silver Peak is another district called the Gold Mountain district. One of the ledges called the Gold Mountain lode, has been sold to an Eastern company for $30,000, and a 20-stamp mill was being erected to work its ores.

Col. Catherwood, who had been operating in the Palmetto district, was said to have sold out and gone East.

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

BOWER'S MILL BURNED.—Gold Hill *News*, June 18th: The Bower's mill was destroyed by fire this morning. The fire is believed to be the work of an incendiary, as the mill has not been running for several months. It contained three batteries of five stamps each, and 18 pans, with machinery in proportion. It belonged to the estate of L. S. Bowers, deceased, but was held under a mortgage by George Waters. It was insured for $16,000, which nearly or quite covers the actual loss.

MINING ITEMS.—Same of 19th: In the Yellow Jacket, less than 100 men are employed, owing to the difficulty of ventilation. The two main drifts at the 800 and 900-foot levels are being pushed northward, and are in some 700 feet from the south shaft. At this shaft the old hoisting works are being overhauled and renovated. The whole will be completed about the first of next month, when the works will be started up.....In the Crown Point, the only work being done is at the two lower levels—1,000 and 1,100 feet below the surface—which are still being driven east from the shaft, toward the ledge.....The new Imperial shaft is about 1,150 feet deep. The water decreases as depth is attained. Only hard porphyry, and barren quartz in the bottom of the shaft, with no signs of metal. The rock blasts well, and Giant powder is used with good effect. The upper levels of the old mine continue to yield ore enough to pay expenses.....Kentuck seems in depressed circumstances at present, no extensive quantities of ore being produced..... The lower Occidental tunnel, which is nearly 1,000 feet in length, is being driven ahead. The flow of water remains about the same. The mine continues to yield well.....Sinking in the Gould & Curry main shaft is discontinued. The upper levels of the mine yield 70 tons of ore per day, averaging nearly $40 per ton.....In the Flowery, the connection between the drift and the shaft will be made in a few days, giving a good circulation of air, and opening up a large increase of ore..... Bullion is still drifting east at the 1,400-ft. level....Challar-Potosi, Hale & Norcross and Savage, are yielding satisfactorily..... Daney hoisting works will be in running order about the first of next month. The mammoth tunnel is 160 feet west of the winze.....Ophir drift west at the 700-foot level from the shaft is in 370 feet.....The first Sierra Nevada clean up for the month, on the 15th instant, yielded $12,000. ....Neither the Belcher nor the Segregated Belcher are yielding ore at present. ....About 40 men are employed in Overman, and the yield of ore is abundant, but of a low grade ...The main Julia shaft is 300 feet deep.....Lady Bryan has plenty of good ore in sight.

WHITE PINE.

THE PROSPECT.—*News*, June 15th: The bullion shipment of last week fell a little short of that of the week preceding—partly owing to the elections. Mining was generally suspended. The shipment was about $70,000 for the week, to $78,000 for the previous week. Ten mills,—in all 120 stamps,—are kept constantly at work on good ore. The supply at the mill is kept well ahead, and the large stacks at the mine dumps, while the dumps at the batteries are kept full, give guarantee for the erection of more mills. The milling capabilities of the district will be more than doubled during the summer. The Consolidated Chloride Flat Co. is now erecting a second mill of 20 stamps. The Aurora Co. is erecting the finest mill in the district—30 stamps. Another is to enter the list in a few days—the mill of the Metropolitan Mining Co.—15 stamps. The Pogonip & Othello Co. has such an amount of fine ore as to demand a mill, and the managers are arranging for the machinery. When the mills now under way are running, we will have a crushing force of 185 stamps.

ITEMS OF PROGRESS.—*News*, 11th: Ore worth $4 per pound is coming out of the Posthole mine....15th: Silver Wave ore, average assay, $420 per ton....Eberhardt is working 85 men....White Pine Mountain, across the cañon west of Treasure City, is 1,027 feet higher than the highest peak of Treasure Hill,—as ascertained by Major Sherman....Chloride Flat is lively with pack-mules laden with sacks of ore. ....The Rattler is shipping ore to the Nevada mill....18th: Rich ore struck in the Kasell mine yesterday....Work suspended on the Good Omen....Do. on the Phil. Sheridan, temporarily....Original Hidden Treasure is yielding 100 tons of ore daily, 40 tons being shipped to the mills at Hamilton and Newark. The ledge is 97 feet wide. The company contemplate putting up a 40-stamp mill....Pocotillo difficulty settled, and work commenced....Mammoth ore assays $720 per ton....West Point main shaft now down 40 ft. Giant Powder used... Evening Star ledge—in Mahogany Cañon, between Eberhardt ridge and Argyle Hill,—has been stripped 140 ft., and no walls yet. .. .The Mazeppa has struck a solid body of rich chlorido ore in the 9-ft. breast.... The Industry mine near the line of Chloride and Pogonip Flats, last Sunday shipped $2,763.42, and on Wednesday, $2,548.86—total this week, $5,312.38.... Oakland Co. has struck ruby silver at depth of 40 ft....Horseshoe ditto.

HAMILTON.—*Empire*, 15th; Mr. Brown will put up smelting works on the Queen City, Base Metal Range....Mr. Howe will have furnaces on his mine, in the same range. His ore averages $300 per ton.... 17th: Bullion Hill is the name of a newly discovered series of ledges, about two miles west of Hamilton. Mr. Marsh got an assay of over $7,000 per ton. It will be another Treasure Hill.

TREASURE MILL.—*Empire*, 18th: "It takes three men to carry away the amalgam and handle the quicksilver. There is a pile of ore now at the mill about 4 ft. deep, 50 ft. wide and 100 ft. long; and yet it comes at the rate of 40 or 50 tons per day.

OUTSIDE DISTRICTS.—Reports from Patterson are favorable....Cole & Johnson's claim in Pinto Disirict, has a 57-ft. ledge, and is rich all the way through....We saw yesterday two bars of bullion from Robinson District,—one from the Mayflower, and one from the War Eagle.... Kern is a new district on the western end of Snake Range. Indications are good.

NEW MEXICO.

ANIQUIU.—Santa Fé *Gazette*, June 5th: The reports from the newly-discovered mines near Abiquiu are exceedingly favorable. Many of our citizens have gone up to see what is to be seen. Should the placers prove as rich as is anticipated, water will be taken to them from the Rio Chama in time to do a good quantity of profitable work this season.

MORENO.—*Lantern*, May 29th: Maxwell's 30-stamp mill has left Sheridan, and will soon be pounding away among the mountains on the other side....L. B. Maxwell bought out the Leaveuworth Co. for $8,000 cash....The last contract on the ditch has been let....Connelly & Chaffin, in tunneling to the Pacific lode, have struck a rich vein of ore. The depth is 200 feet. It is called the Golden Gate....The Grouse Co., composed of Thomas Lothian, Martin Lasswell, Geo. M. Carpenter, Henry Shuman and Charles Williams, cleaned up on Tuesday last 20 ounces of dust, the result of five days run with three men.

WYOMING.

CARISO.—*Sweetwater Mines*, June 9th: Z. Swaringer informed us that the sale of 400 feet on the Cariso ledge has been closed, and that Mr. French would arrive on the 16th. A 30-stamp mill is to be brought from Silver City, Idaho.

WHITE FAWN.—This ledge is turning out good. At a depth of eight feet it prospects well.

ITEMS.—Major Baldwin's claim on the Silas Wright looks well. John Snetzer on the same ledge has a vein five feet in width. He has a shaft down 10 or 12 feet....J. W. Reed has discovered a good-looking ledge near the St. Lawrence.....The Mary Ellen ledge has been found 1,200 feet west of discovery. It is looking better in the last shaft than at any other point.... Donald & Smith have resumed work on the Barnaby lode.....Young America 10-stamp mill arrived on Monday.....The Willow Creek Co. will be ready to commence sluicing this week.....Jim Mill's 10-stamp mill arrived to-day.....Poorman has a 10-foot shaft, and a vein of 2½ feet. Rock frequently shows free gold.

MAMMOTH.—Same of 12th: Col. Elliot has erected a splendid shaft house and dwelling houses for hands. There will be a large mill erected as soon as the machinery arrives from Chicago. The Mammoth lode has a crevice of thirteen feet of good mill ore. There are several extensions.

ITEMS.—The Minnesota prospects well. ....The World Beater has a 27-foot shaft, and a 2½ foot vein. The work goes on day and night, and splendid quartz is coming out. We saw specimens covered with free gold.....A 14-ounce nugget came out of Rock Creek on Wednesday.....Captain Turner has leased the arastra on Wilson Creek, and will commence running on rock from the Carrie Shields and White Fawn ledges.....Henry Clay Co. are sinking a shaft.....Mr. Anthony's 10-stamp mill at Atlantic City, will start up in a few days. ....The claims on Atlantic and Smith gulches are paying handsomely.

COAL, IRON AND RAILROADS ON THE GULF OF MEXICO.—E. G. Barney has made a report on the mineral resources of Alabama, in reviewing which the Mobile *Register* puts forth the claim that coal and iron can be produced cheaper in that State than in Pennsylvania. The Grand Trunk Railway, terminating at Mobile, is advocated in connection with projects of mineral development which, it is stated, would, if carried out, be of more worth to Mobile than cotton ever was. The present Gulf demand for coal is 500,000 tons annually.

CHINESE IN THE EASTERN STATES.—It is said that there are now about 1,000 Chinese in New York, engaged in various light occupations. Some enterprising Yankee has given out word that he intends to obtain an additional number, which he proposes shall be engaged in housework, after the manner of similar employment in this city. Another still more enterprising genius, proposes to procure some fifteen or twenty thousand of the same race to work the sugar and cotton plantations of the Northwestern States. He proposes to take them thither over the Pacific Railroad.

STORAGE OF PETROLEUM.—M. Deville thinks that many of the fires from petroleum are caused by its expansion in bulk in hot weather, causing bursting of the containing vessels, or oozing out of their contents unnoticed, which are then a source of danger. The preventive is to leave sufficient room for such expansion in filling the vessels.

CASKS MADE AIR AND WATER-TIGHT.—The *Chemist and Druggist* says that a series of experiments has been instituted with the object of testing paraffine for this purpose. "The result has been to establish fully the value of the process. Paraffined casks, while retaining the safety and economy of wooden vessels, are in respects of cleanliness and non-absorption, equal to glass."

A PRETTY FANCY.—A very peculiar and charming effect is produced by mounting diamonds on fine invisible springs, so that whenever the wearer moves they acquire a peculiar quivering movement, and scatter their rays of brilliant light like minute stars.

GEORGE FRANCIS TRAIN may be mad, but there is method in his madness. Three years ago he had the foresight to purchase 400 acres of land in Omaha, which is already worth six or seven times what it cost him, and still rapidly increasing in value.

CENTURY PLANT.—The citizens of Rochester, N. Y., are being treated to quite a novelty—a century plant in bloom. It is attracting much attention.

San Francisco:

Saturday Morning, June 26, 1869.

Notices to Correspondents.

E. B. P., Havilah.—"Horse-power" is a mere conventional expression of power, in a steam engine for example, and does not mean anything definite, the real criterion of power being the amonnt of steam pressure with which you follow up a certain (correspondingly) sized piston. As this pressure varies from 7¼ to 100 pounds to the square inch, from low to high pressure engines, the ordinary rnle for obtaining the nominal horse-power of an engine is to multiply the sqnare of the diameter ("D") of the piston in the cylinder, in inches, hy the stroke, ("S") the nnmber of feet it travels per minute, allowing for pressnre conventionally; or, precisely stated, $D^2 \times \sqrt[3]{S} \div 15{\cdot}6$, for high pressure. For a condensing engine, divide by 47, instead of 15·6. In the use of water, the theoretical horse-power is ohtained hy multiplying the head of water from the tail-race, in feet, by the quantity of cubic feet per minute; and the theoretical power being as 1, the effective horse-power, in case an overshot wheel be nsed, would be 68-100ths of that figure.

Founder.—An opinion has been expressed by Professor Hennessy, based on some results fonnd in the writings of Professors Thompson and Clausius, on the dynamical theory of heat, touching the infinence of pressnre upon a molten fluid (so circumstanced as to he incapable of losing any portion of the heat evolved in consequence of condensation), that so long as the matter continued in a fluid condition, the resistance to compression wonld be very small. Shonld, however, the fluid he on the point of changing its state to that of solidity, the effect of ths latent heat of fusion, (supposed to he incapable of emission), would interpose a resistance of enormous power. The fused matter of which the intsrior of the earth is generally suppossd to exist, may be in a condition similar to that just atated, owing to the low conductive power of the outer crust.

Interested.—Earthquake tahles, of periods of more than 1,100 well-recorded earthquakes have been made of such as have occurred at the four special seasons of the year to which you allude, and are called hy Professor Perrey, of Dijon, and others, the *critical epochs*. As will he seen, the period extends over twenty days, viz., ten days before and ten days after each solstice and equinox—

Vernal equinox (March 10—30)	310
Summer solstice (June 11—July 1)	264
Autumnal equinox (Sept. 13—Oct. 3)	249
Winter solstice (December 11—31)	318

Notwithstanding the inferences which may and have heen drawn from the table given, it is far from settled that any very great difference of earthquake energy exists between the times stated, and other parts of the year.

Carlin.—You were right; ten psr cent. is ths legal rats of interest in California.

Continental Life Insurance Company, 203 Montgomery street, corner of Pine. *

Schlaginweit's Lectures on Central Asia.

Prof. Robert Von Schlaginweit has lectnred twice at the Mercantils Library befors the cultivated German population of San Francisco, and on Monday evening last he also made some remarks befors the Academy of Sciences, which wers highly appreciated. His appearance and mannsr remind one of Bayard Taylor, bnt his matter is very simply and accurately descriptive. He conveys a great deal of information in a manner so effectivs as to create in the mind of the auditor a perfect and lasting picture of the conntry described. Worthy of remark is the fact that the educated and better class of Germans in San Francisco can so nearly fill the hall of the Mercantile Library with an audience whose mental and physical appearance impresses one most favorahly as to the character of the Tentonio element on the Pacific Coast.

The elevated plains and harreu regions of Thibet; the sway of China and tinctnre of Mongolian blood so far towards the west; the people's habit of holding annnal markets like that of Nijni Novgorod in Russia; the prevalence of religious feeling, in Buddhistical tenets and in the industrions use of the prayer wheel; odd customs, snch as polyandry,—the reverse of polygamy,—where one woman has many hnsbands, generally brothers; the absence of a very ancient literatnre, like those of India and China; the extreme vigilance of tho boundary police with whom every traveler has his encounters—and many other interesting points to which we are unahle to do justics, constituted the matter of the Professor's lectnres.

Interior Changes.

In Alpine County, the Indians engage in grading lots, excavating cellars, filling up streets, furnishing wood, and undertake a variety of work by contract. Wherever the white man's industries establish themselves in the newly-prospected countries, the Indian hows to destiny and falls into line—or vanishes like clouds after sunset, unaccountably from our sight. We have seen the Washoes congregated in all their native glory in the regions designated Alpine Connty, and we wonder at the changes that are going on, above and below the surface, in that conntry of the pine nut, under the strong arms aud telling hammers of a race that will conquer, if it be the old earth itself, and that will not be discouraged. Times are changing, nnder the pertinacity of labor, even the aspect of those sweet-scented pine hills. We snrmise that it will now be a rarer sight to happen npon several hnndred hnmming bucks, and as many modest-eyed aboriginal belles of the mountains,—in whose faces and eyes we have observed playing the same consciousness of magnetic femininity that bslongs to polished and civilized society—dancing in circles on the grass and making merry by moonlight on a midsnmmer night. Where we rambled over trails, on our way to the summit of Cary's Peak, or labored up the timbered ridges of the pallisaded region of the Sierra in that vicinity, we would to-day happen upon fresh cut mountain "grades," and here and thsre upon a *halde* of disemboweled rock, from out the mouth of some dark cool tunnol, leading into the interior mysteries of those ont-of-the-world mountains, where the sprites of the little green valleys in all prohahility mnst have bsen hiding themselves ont of our sight when we were there,—since it is evident that in such a country they do exist, were we but able to see them.

Old Subscribers.

Whose term of subscription expires with the end of the present volume (XVIII) will oblige us by remitting their subscription for the next year at once, so that it may be received before the next issue.

Artificial Stone Manufacturing.

Indications of activity, prosperity, and snccess ars met with in the establishmeut of "The Pacific Stone Company" at the corner of Tnrk and Larkin streets. Difficulties that for a time made tho inaugnration of this new enterprise an exceedingly laborious and worrying task to the superintendent, (Mr. Steen) have one by one been satisfactorily overcome. Infusorial earth is now discarded, and common white quartz snbstitnted for the mannfacture of silicate of soda; while sand of a superior quality is obtained from North Beach, and from Alameda County. For certain kinds of stone, pnre quartz sand is preferred; for others, the disintegrated sandstone of the bay peninsula is found to be better, making a tougher stone. Thers is at present in hand a largs contract for balustrades around the porches of the residence of Mr. Ralston, in San Mateo Connty, whoss architect, having examined some test prodncts of the establishment, pronounced them superior, as stone, and for that purpose, to any building stone that could he quarried in the country. For city railings and fences, there are produced very tasteful designs of massive sandstone, the cost of which is only about double that of a cheap wooden fence, while the effect is exceedingly substantial. Scarcsly a beginning has yet been made in the arrangements for the immense variety of applications to which the Ransome stone process is adapted. The grindstone trade alone is said to be enough to keep these works,—which are not small,—constantly employed, the consumption of that article being surprisingly large in the aggregate. Molds are made for any desirahie size and shape, from a chnrch pillar to a statue; the sand, properly mixed and moistened with silicate of soda, is shovelled in; then the cementing or binding fluid, chloride of lime, is forced into the pores by suction, in other words by exhaustion of the air with an air pump. The unalterable silicate of lime, and the soluble chloride of sodium result; the latter being easily washed out hefore the stone has set. It is expected that a business amounting to millions of dollars per annum will soon be done in this State under the Ransome patent.

Figures.

One ton of ore shipped from Battle Mountain station on the Pacific Railroad, beyond Humboldt district, will serve, from amongst numerons batches recently forwarded, as an example of what can he done, from what *has been* done, with low grade ores in the vicinity of convenient transportation. It assayed $75, in gold and silver, and contained 15 per cent. of copper. A firm on Battery street paid $35 for the same, to ship to Swansea. Deduct:

Cost of mining	$ 7.00
Sacking	3.00
Hauling five miles to railroad	5.00
Freight to San Francisco	12.50
	$27.50

There is left a margin per ton of $7.50. But if the ore assays more in copper, the prices offered in this city are much increased, viz., such figures as the following: For 20 per cent. copper ore $50; for 33 per cent, $85; for 35½ per cent. with only traces of silver, $94.07.

Three men can mine two tons a day, at a cost of not exceeding $16. From these figures it would appear that many mines containing ores of a low grade in silver, could he developed successfully without capital.

Emigrants on the Plains.—Ths railroad has not yet altogether driven the ox teams from the plains. The Cheyenne *Argus* recently reported 36 wagons on Crow Creek, hound to California and Arizona. Farmers who have stock and wagons which they wish to transfer to this side of the Rocky Mountains, with their families, can accomplish their object cheaper by using the emigrant road, than they can by "riding on a rail."

Iron Manufactures—Foundry Work.

The Superintendent of the Risdon Iron Works, Mr. Jossph Moore, has rscently rstnrned from his visit to Eastern and European iron manufacturing establishments, and has hrought with him many of ths latest and best improvements in machinery, tools and procssses.

At ths Risdon Works thsre are two boilers for the U. S. steamer Saranac, now undergoing repairs at Mars Island. The boilers are made on the Martin patent, and contain six furnaces each, msasnring 23 feet wids, 11 feet long by 15 iuches high, and weighing very nearly 40 tons each. There are 1,434 brass tubes in each boiler, set in perpendicnlar rows. The boilers have the water insids and fire ont, instead of being in the usual mauner of tuhular boilers. The hydraulic tests of 40 pounds per square inch has beeu successfully applied.

There is also in the shop, finishing, 10,000 feet of watsr-pipe for the White Pine Water Company, made of sheet iron, and intended to stand enormous strain; also three or four thousand feet of 22-inch pipe for the Spring Valley Water Co., of this city. This is ahout the ninth mile of pipe the Risdon Works have made for the above Company. Although pnt under a heavy pressure, they remain perfectly tight. Some excellent tools for this branch of their husiness have been gotten up expressly to enable them to manufacture work of this kind bstter and at lower rates than they would he able to do without snch special machinery.

There are also a number of boilers for stationary engines, and more for marine engines, in the manufacture of which class this Company are prominent on this coast, having at the present time six steamboats on hand—from the handy tug-hoat for light vessels, up to a heavy side-wheel, viz.:

1	side-wheel, City Ferry Company, 2 engines	22x5
1	propeller, California Dry Dock	2.22x24
1	" Capt. Kentfield	2.22x24
1	" Goodall & Neilson	1.24x24
1	" California Pacific Railroad	1.28x24

These boats have all been huilt and will he in operation in five months' time, and have all heen made nnder a pressure of other business, evidencing large resources of mon and tools.

There aro also being shipped 25 boiler-iron cars, for the Virginia and Truckeo Railroad, capable of carrying eight tona of quartz each, intended to run the quartz to "timber," or water, instead of, as has besn done, taking water and timher to quartz.

There are also four stationary engines in course of construction, besides other heavy steamboat work, making and repairing.

Important Expedition.

A military expedition is about to be sent out to examine and map out that extensive region of conntry in the Nevada, lying between White Pine and the head of navigation on the Colorado. Able geologists, mineralogists, and botanists, will accompany the sxpedition, whose reports upon their several specialties will donbtless furnish a large amount of valuable information. The region referred to is almost a *terra incognita*, although there is good reason to believe that its mineral value is fully equal to any of similar extent in the Great Basin. The geographical department especially, as well as the entire *personelle* of the expsdition, will be under the immediate charge of eminent officers of tho U. S. Engineer Corps. Gen. Thomas, who has conceived and planned this expedition, deserves the thanks of the community for this eminently practical and useful employment of a portion of the military under his command. We feel confident that important results will bs attained, and such could not have been realizsd from private enterprise.

Geo. P. Booth, of Ssymonr, was the engineer who run the first iron horse over the Pacific Railroad.

Affairs of the Mercantile Library.

A circular has been issued to the friends of the Mercantile Library Association, by the President of that body, Mr. Swain, stating, in the plainest language, that it will be necessary to raise a sum which ought not to be less than $75,000, in order to save that institution from dissolution. The elegant and commodious building which has just been erected on Bush street at a great cost, to meet what appeared to be a growing taste for letters, is burdened with a heavy debt. "A portion of that debt," says the President, "*must* be liquidated, and the expense of interest *must* be removed."

It has been repeatedly alleged that the wealthy men of San Francisco are not enterprising in discovering and watching their united interests. The charge has never been made that, upon occasion, they are also wanting in liberality. Californians love to congratulate each other in the fact that a superior average of intelligence, and a higher degree of energetic manhood is to be observed on this coast, to any other country in the world. If this generally accepted doctrine be not idle vanity—an article of newspaper commerce such as should become doubly nauseous in a land that has real cause for pride—certainly no single fact, no institution west of the Plains, could be pointed out with better effect as characteristic evidence of the truth, than the Mercantile Library of San Francisco. So central, widely-extending, and powerful has been its influence for good, from the "early days," and so genial and satisfactory has been its uniform management, that we can scarcely doubt but that the President's appeal will be very generously responded to. Amongst the public institutions of San Francisco, the Mercantile Library is our chief pride. Should the Library be allowed to become involved, let no newspaper ever again assert that California is liberal, or that her leading citizens are above even a moderate average of intelligence.

The California Medical Gazette.

We acknowledge the receipt of the June number of this journal from the publishers, A. Roman & Co. Among the especially interesting pages in it, is the first. It contains an article by Dr. Stout of this city, upon apparatus for treatment of fractured thighs,—with an engraving of a new arrangement for that purpose, devised by that gentleman himself. We are always glad to see newly-invented surgical apparatus. It suggests new relief to suffering. We wish the inventive faculty were more often exercised by the intelligent members of the profession; particularly those devoted to the surgical branch of it. It is true, that the only inducement to it is a purely philanthropic desire to relieve pain; for it is not considered exactly in character, by the members of this noble profession, to *patent* any device connected therewith. We think the idea is, in a great measure, a false one. Why should not a man who has devoted his best years to laborious and often repulsive duty, provide for his declining ones by such use of his hardly-earned experience, as shall secure his pecuniary ease? We see no reason why a false sentiment should place him at a disadvantage with his fellows, and deprive him of the reward offered by Government for the very purpose of stimulating invention and accelerating progress. We may have something more to say upon this subject at a future time.

A Few More Subscribers

Can find room for their names on our subscription books. This announcement may be interesting in connection with the fact that we next week commence a new volume of the MINING AND SCIENTIFIC PRESS. The beginning of a volume is always a good time to commence new subscriptions.

Arizona.

The hopes and prospects of this Territory, so long harassed by Indians, and hindered in its development, by weary distances of desert roads and mountains, brighten just in proportion as the probability of the speedy continuation of the Kansas Pacific Railroad along the 35th parallel. Should the companies having charge of that enterprise show signs of life during the course of the summer. Arizona will be well deserving of a visit by the speculative; for the Indians will certainly soon withdraw to farther mountain recesses, or to Mexico, and half of the territory being excellent grazing country, largely timbered, with immense tracts of fine farming land, there will be no farther drawback to the growth of permanent interests, the forfeiture of which has so especially characterized that country. The Prescott *Miner* estimates the population of Yapavai County at 3,000, and says there are within 30 miles of Prescott 200 good sized lodes containing sufficient gold to pay handsomely for working and treatment by chlorination process. The Sterling lode, for example, contains $15 to $20 in free gold. No statement need be attempted here of the rich copper, silver and lead veins of that Territory. Thanks to Ross Browne, sufficiently ample details are accessible in "Mineral Resources, etc."

The Arizonians are wearied of frontier hardship, seclusion and barbarism, and slow progress in the development of mines that ought to be valuable but are not, from extraneous causes. Geologically and Mineralogically that region does not differ much from the silver mining regions of Sonora, Chihuahua and Durango in Mexico; we are told that some of its mines were worked profitably 75 years ago.

Railroads can work wonders for countries situated like Arizona. We know now, not only how continental railroads can be built, but how they pay; and these things move rapidly under energetic hands. Arizona need not be discouraged. Her salvation is in a Southern Pacific Railroad.

Progress of the Rust.

The wheat fields in several portions of the State, appear to have been more or less injured by the rust. It made its first appearance, and has done the most damage, along the coast valleys where cold winds prevail, and where the fogs linger—in the Salinas Valley, and in the western portion of Santa Clara County. We also hear of it in some of the interior counties, as in Napa, the northeastern portion of San Joaquin, and in the southern part of Alameda. It is as yet difficult to say whether it will materially affect the general aggregate of the yield. Interested parties are evidently making an effort to spread such an idea; but the public will do well to defer yet a little longer, the formation of any definite opinion. It is curious and significant to notice from our exchanges, that summer fallowed lands, and those fields which have presented a healthy and vigorous appearance from the start, have suffered less than where the lands have been over cultivated; or are of an inferior quality for wheat growing. This fact has a significant importance when read in connection with what we have elsewhere said under the head of "Rust and Smut in Wheat."

PERSONAL.—We notice the departure for the East of Mr. Durbin Van Vleck, the engraver whose artistic productions are well known on this coast, and have been very frequently associated with the pencilings of Nahl. He will establish himself in Boston.

Mr. G. F. Deetken, of the Eureka mine sulphuret works, Grass Valley, has left for Europe, to inquire into gun cotton as an explosive and bring it to this coast, such progress having been made in the practical use of that very economical agent.

Anna Dickinson is at Salt Lake.

METALLURICAL.

RICKARD'S TAILINGS CONCENTRATON AND AMALGAMATOR.—W. T. Rickard, formerly of Gold Hill, has devised an amalgamator, which is especially useful at the same time as a slum concentrator, and which is described in the London *Mining Journal* as a U-shaped vessel of galvanized iron, some six or eight feet long and four feet wide, through which a shaft passes, carrying a series of circular copper plates, so connected as to form a continuous screw, which just dips into the bath of mercury, and keeps the mercury continually clean, and in a fit condition for catching the gold. It is necessary to clean the copper plates with a little sand and dilute sulphuric acid, wash in clean water each plate as soon as the surface is perfectly bright, and immediately after apply sodiumized mercury, made in the proportion of one part of sodium to 1,000 parts of mercury. A back and forward action of the screw dashes the particles of ore with violence, first on one side and then on the other of each amalgamated screw-plate, which soon becomes coated with gold or silver amalgam. The slum experimented upon was from Weston & Co's mill, Virginia City (upon Occidental ore), and assayed before amalgamation $29.25; after amalgamation, $11.37½—bullion obtained, $17.87½. The same slum, when tried in barrels, yielded but at the rate of $7 per ton. Mr. Rickard says, in speaking of his machine: "After trying every known machine likely to obtain the bullion from the troublesome residuum without success, I at last caught an idea from a crazy old fellow, which, with the assistance of an experienced gold amalgamator from California, enabled me to perfect a machine which has rewarded my efforts with perfect success."

PATENT FLUX.—Dr. Charles W. Moore has been engaged in smelting some of the base metal ores at Shermantown, experimentally, with his "patent flux," in a temporarily constructed cupola furnace, heated up by a blacksmith's bellows; and has shipped to San Francisco several bars assaying .560 fine. He proposes to erect extensive works at Shermantown, and promises, says the *Empire*, to "be able soon to reduce the ores to bullion at the rate of thirty-five tons per day out of 266 tons of base ore"—which is probably typographically erroneous. This flux we understand not to be a patent, but a secret. A cheap flux is like one of the many tools of a mechanic, a most valuable article in smelting when understood and used with reference to the special purpose to which it may be adapted, of course upon the mineralogical contents of the charge, but varying accordingly.

FROM MONTANA AND COLORADO we learn that Mr. Augustus Steitz, of St. Louis, is in charge of extensive reduction works at Helena; and that Mr. Stewart, at Georgetown, Colorado, is amalgamating raw low grade ores to 45 and 60 per cent.; chlorinating high grade copper and zinc ores, obtaining 75 to 80 per cent.; and smelting galena, with a result of 90 to 95 per cent; employing a working force of 12 men.

ACCIDENT TO PROF. BUNSEN.—This enthusiastic scientist has met with an accident which threatens the loss of his only remaining eye. Being engaged in preparing some pure rhodium, he had placed a quantity in the form of a finely divided precipitate, in a water bath to dry. On inspecting it some time after, he found that, owing to the carelessness of some one, the supply of water had been turned off, and the temperature of the bath too highly raised in consequence. While engaged over it, an explosion took place. Both his eyes were burned, and both hands badly torn; nevertheless the precious capsule containing the result of his experiment was not dropped, but carefully replaced upon the furnace.

The scientific world will rejoice to hear that his physician has expressed hope of saving the eye. The other has been sightless for years, in consequence of a somewhat similar explosion.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.,

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,

Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S Hallidie & Co., 519 Front street:—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

CALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1857, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Cantier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest size—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,

18v18-9p 519 Front street, San Francisco

To News Agents.

From July 1st, 1869, News Agents desiring five or more copies weekly of the MINING AND SCIENTIFIC PRESS, will be furnished direct from the office, at a reduced price from former rates. Orders for a less number can best be supplied through San Francisco wholesale agents.

Medical Practice and Quacks.

We have received the June No. of the *Pacific Medical and Surgical Journal*, from the publishers, Messrs. Bancroft & Co. Besides the usual amount of such original and selected matter as addresses itself more especially to the members of the profession, we always find something in this journal which is of interest to the general public. We copy a little anecdote from the present number:

Almost the pioneer among advertising quacks in California, was "Doctor" J. C. Young. He was totally destitute of all pretensions to medical knowledge; having worked as an upholsterer up to the moment he was transformed into a doctor. More shrewd in one respect than most of the breed, he did not attempt to practice medicino, but always employed some one who did the prescribing. The writer of this article was once called in consultation with Dr. C—, a regular practitioner who had emptied his purse in a long series of "experiments on alcohol." On arranging for a second visit, Dr. C— was unable to attend between eight in the morning and six in the evening. Such a strange announcement required an explanation, which was given as follows: "I am occupied in the service of Dr. Young. It is mortifying to me as a regular graduate to confess it, but the necessities of my family have compelled me to take the position. Dr. Young gives me $250 a month for prescribing for his patients, and I am under obligation to remain in his office from eight in the morning till six in the evening." "And does not Young prescribe for his patients?" "Oh, no! I thought everybody knew that. He sits in the front office at his desk, keeping the books. When the patients enter, he receives them and passes them into my room. I examine and prescribe for them, they supposing always that I am Doctor Young. I give them the prescription, which they take to Young, and he settles with them and receives the money. I pass for the Doctor and he for my olerk."

This is better than we had supposed. "Doctor" Young was not, after all, totally depraved. While we do not wish to be understood as recommending the above dodge as a new and ingenious form of speculation, we may say that we do hope that all future adventurers in the medical ranks may have sufficient good sense and sufficient humane feeling, to do as Young did, and employ some one who has at least been through the regular steps of a medical training, and is therefore, not wholly in the dark.

INCREASE OF AUSTRALASIA GOLD YIELD. There seems little reason to doubt that the yield of Australasian gold is on the increase, this result being attributable, as we shall show presently, to the discovery of several new fields. In the year 1868 we received Australasian gold to the value of 6,989,594*l.*, as compared with 5,801,207*l.* in 1867, 6,839,674*l.* in 1866, 5,051,170*l.* in 1865, 2,656,971*l.* in 1864, 5,995,368*l.* in 1863, 6,704,753*l.* in 1862, 6,331,225*l.* in 1861, 6,719,000*l.* in 1860, and 8,624,566*l.* in 1859. It will be seen that the total receipts of Australasian gold for the 10 years ending 1868 inclusive were altogether 61,713,528*l.*, 1868 having made the largest yearly contribution to this aggregate, with the exception of 1859. Although the yield of Australasian gold has been increasing of late, it had been declining for some time previously, the aggregate receipts for the five years ending 1863 inclusive having been 34,374,912*l.*, while for the five years ending 1868 inclusive, the corresponding aggregate was only 27,338,616*l.*—*London Mining Journal.*

THE ATLANTIC TELEGRAPH—DOUBLE LINE COMPLETE.—By the completion of the new duplicate line from London to Valentia, on May 21, the two Atlantic cables are now enabled to be worked together; and one is used exclusively for sending dispatches one way and the other for sending them the other way. The regular communication between New York and London ought now to be almost instantaneous.—*Am. Artisan, June 2d.*

ENGLISH PATENT LAWS.—The question of the abolition of the Patent Laws was recently discussed in the British Parliament, and the London *Times* supports the measure. That journal has heretofore expressed its opinion very decidedly against the policy of giving pateuts for new inventions.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,

SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, in the mining or milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London. 6v18-6m

FOR CLEANING THE HEAD AND HAIR. THE CLEANing of the head and hair has been the subject of consideration for a long time. This object will be accomplished by using

CAMILLE CHAMPOO,

which not only does away with the poor soap so offensive to use, and so injurious to the hair, but it cleans the head, strengthens and beautifies the hair, preserves the color, and prevents baldness. It is cooling in nature, and can be used with safety and reliance on the smallest infant. Price 50 cents per bottle. Prepared by EMERTON & LUELLING, 273 Mission street, San Francisco, Cal.

HEATHFIELD & BOOLE, Wholesale Druggists, 206 and 208 Battery street, San Francisco, Sole Agents for the Pacific Coast. 24v18-3m

Ayer's

Hair Vigor,

For restoring Gray Hair to its natural Vitality and Color.

A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long ou the hair, giving it a rich glossy lustre and a grateful perfume.

Prepared by Dr. J. C. Ayer & Co.,

PRACTICAL AND ANALYTICAL CHEMISTS,

LOWELL, MASS.

PRICE $1.00.

Sold by all druggists and dealers in medicine everywhere. Crane & Brigham, San Francisco; R. H McDonald & Co., Sacramento, General Agents. 25v18eow4m

That will resist the extremes of heat and cold without liquefying or hardening.

It is therefore peculiarly adapted to the varied climate of this coast, especially localities where THE WEATHER BECOMES EXCESSIVELY HOT, causing oil and all other kinds of grease to run from the axle, retaining the proper position. It remains soft until exhausted, leaving no deposit of GUM, TAR OR PITCH. Its superior lubricating properties, durability and cheapness have been tried and approved by the CENTRAL PACIFIC AND OTHER RAILROADS, STAGE PROPRIETORS, STABLE KEEPERS, TEAMSTERS, CONTRACTORS, MILLMEN, FARMERS, and many others who prefer to

USE NONE BUT THE BEST.

It being prepared by a peculiar CHEMICAL COMBINATION OF OIL, previously freed from gum or other deleterious substances, it must be obvious that by its use friction will be reduced to the lowest point. We feel assured that all desiring A NO. 1 LUBRICATOR will give this the preference over any other Grease IN THE MARKET.

Sold by the Trade generally, and at the Factory, 100 Commercial street, San Francisco.

2v18-3m PETTIT & CO.

LEA & PERRINS'

CELEBRATED

WORCESTERSHIRE SAUCE

Declared by connoisseurs to be the only

GOOD SAUCE.

The success of this most delicious and unrivalled condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine, is to ask for

Lea & Perrins' Sauce,

and see that their names are upon the wrapper, labels, stopper, and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L and P give notice that they have furnished their correspondents with power of attorney to take instant proceedings against Manufacturers and Vendors of such, or any other imitations by which their right may be infringed.

Caution against Fraud.

Ask for LEA & PERRINS' Sauce, and see name on the Wrapper, Label, Bottle, and Stopper.

Wholesale and for Export by the Proprietors, Worcester; Crosse & Blackwell, London, etc., etc.; and by Grocers and Oilmen universally. Agents, CROSS & CO. San Francisco. 3v18-6m

SAN FRANCISCO, May 5, 1869.—MESSRS. DEWEY & CO. Gentlemen:—Allow me to express to you many thanks for services rendered me in procuring my patent, which has just come to hand. Mining Property for Sale.

A Two Thirds Interest

OF THE

Golden Rule Mining Company's

Claims and Mill,

Situated in Tuolumne County, California, two and a half miles south of Jamestown, on the Great Mother Quartz Lode. A good 15-stamp Water Power Quartz Mill is situated on the property, with a never-failing supply of water, as can be shown by the last four years continual running. This Claim has three parallel Ledges, from 50 to 100 feet apart, averaging from two to six feet in width, with a length of six hundred feet. They are so situated that a tunnel has been run through them at right angles, making a surface drainage of from seventy to eighty feet in depth on the mine. The mine is well ventilated by shafts from the surface, and well timbered so far as worked. In the mine are steam Hoisting Works, capable of hoisting from a depth of 300 feet. A force of thirteen men only are required to keep both mill and mine running regularly.

On the surface and flats for a distance of 500 feet from these veins, the ground or surface was mined by placer miners, in former years, producing from two to five ounces per day to the man, during the season when water could be obtained, which fact goes to prove that a heavy deposit of ore was once contained in the crippings of these shutes, which, by all former and present theories of deep mine workings, came from below, indicating that when sunk upon to a proper depth, the lead will develop a mine equal to the Amador or Eureka.

This claim has paid its 19th regular dividend of $1,500 each, during the past four years, besides all the construction and other expense account, and has levied no assessments during the same time, and at present has on hand $8,000 in the Treasury, and no debts.

The last level 150 feet from the surface rock, averaged $7 per ton, on which was a profit of from $1 to $1 50 per ton. The length of the two shutes of ore on the east vein, and the only one worked upon, has been about 200 feet.

Now I propose to sell two thirds of this valuable property for $16,000, cash; and any party who desires to purchase a property of this kind—which theory has proven that is required depth, on well known shutes of ore, for a sure fortune—can obtain a chance here, providing he or they will go down a sufficient depth. No purchaser is solicited unless he first goes and examine the mine, or sends a mining engineer in whom he or she have confidence, to indorse what he may think proper of what has been here stated.

For any further particulars, direct by letter to Wm Bosworth, San Francisco, P. O. Box 1978, or at my office, room No. 5, over Donohoe & Kelly's Bank.

PATENT OFFICE REPORTS, from 1843 to 1847, MECHANICAL are wanted for duplicate copies at this office. Parties having them for sale will please state price, and address DEWEY & CO., Mining and Scientific Press office San Francisco.

[Continued from Page 401.]

underground workings, to the left of G, the lighter shaded part was very rich chloride, and the darker shaded less rich, but is also a worked out, timbered, argentiferous epace. In the open cnt to the right of G, there is exposed a bank or quarry of the height from K, the Keystone shaft-entrance, to the surface line N, in which there are less rich argentiferous spots in the breccia above the bonanza proper, represented by a similar ore ehading.

In the plane of our section there have been fonnd, accordingly, two bodies of ore, at the levels of K and H; while on entering shaft No. 1 and descending along the dotted lines to L, representing another eection across the vein 240 feet farther west, there aremet with, at nearly the same levels, two similar bodies, the upper one of which has been proven to be continuous, but not in the same extraordinary richness, by a level which was run westwardly in from the open cnt (indicated hy the black arch between G and K) to the original Eherhardt shaft.

The sonth wall is nearly perpendicular, as represented; the north wall dips S. about 82°. All along the drift F, ou the north wall, there is a clayey seam of from one to two inches in thickness, which assays a small amount in silver. At its western end, there are to be seen, overhead, cave-like openings indicating the former presence and action of apparently warm waters.

It is evident that the entire mass of matter between the two walls cannot be called *one* true fissnre vein. If the two fissnres have any true relationship to each other,—which is not necessary to imply the permanence of the mine,—that relationship must appear in depth; the breccia hetween the walls would, in that case, be a gigantic and very much battered horse. Either of the two fissures may be a true vein in depth. The sonthern one was two feet wide at B, and filled with breccia, but narrowed to a crack of a few inches in solid rock at 80 feet depth.

The simplest method, perhaps, by which it will he possible to account for the character of the Eberhardt deposit, is by supposing—1st, That the two fissures, and the breaking np, and some probable faulting, first took place by the usual causes of such phenomena; 2d, That acid or solfataric waters circulated through the crevices in snch a manner as to dissolve out irregular openings in the breccia; 3d, That there happened snbsequent flows of waters bearing sulphate or chloride of silver—probahly the latter. A change from an acid to an alkaline character in the water, or the reverse, would be sufficient to account chemically both for solution and for precipitation.

Some of the dimensions are given as follows: Length of ore house, 175 feet; depth in Blue Bell shaft to the hase of the stock-work galleries, 40 feet; in Defiance shaft, 40 feet; depth of open cnt near the gate, 35 feet; of Keystone shaft, to the level of the drift F, 80 feet; of the deposit L, 170 feet; of the original Eberhardt shaft, 40 feet; length of tunnel thereto, from open cut, 80 feet. The dimensions of the upper stockwork as worked out, which is all that is generally known of the Eberhardt mine, are, according to the survey of Westcoat & Mason, approximately — underground, 80×32½×2¼ feet=6,480 cubic feet; and in the open cut, probably about the same, making a total of 13,960 cubic feet.

Out of 400 assays taken indiscriminately on this level with a view to obtaining a general average, the result per ton was $1,500. Pure chloride of silver is 75 per cent. silver and 25 per cent. chlorine. Number of men now employed in the mine, 115. Stamps, at Drake and Eberhardt mills, owned hy the Company at Shermantown, 2½ miles distant, 8 and 10 respectively—working 15 tons in the two mills per day. Owners of the Eberhardt: Messrs. Applegarth, Drake, Barris, Sproul and Crawford, one sixth each; and Messrs. Turner and Willard together the remaining sixth.

DR. HALL has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs. Curling, Druit, Lee, Parker, Acton, Aitken, Churchill, Ricord, Vetpean, Boech, Sperino, and Hewitz. Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to newomers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco. 21v18 3m

Pain Killer.—We beg leave to call the attention of the public to this long celebrated and unrivalled Family Medicine. The Pain Killer is a purely vegetable compound, and while it is a most efficient remedy for pain, it is a perfectly safe medicine even in the most unskillful hands. For Summer Complaint, or any other form of bowel disease in children or adults, it is an almost certain cure, and has without doubt been more successful in curing the various kinds of Cholera than any other known remedy, or even the most skillful physician. In India, Africa and China, where this dreadful disease is even more or less prevalent, the Pain Killer is considered by the natives, as well as European residents in those climates, a sure remedy.

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

New Almaden Vichy Water,

(CALIFORNIA VICHY WATER.)

FROM THE SPRINGS,

NEW ALMADEN,

Santa Clara County.

F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.

OFFICE, 506 JACKSON STREET,
GENERAL DEPOT:
Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the velnous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases wh re a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water caused the efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Kidneys, and Inflammation generally, *when there is no fever;* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.

Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v13tf

A NEW
Gold Metal.

THE GOLD METAL WATCHES

Now being introduced by

C. E. COLLINS & CO.,

No. 629 Washington Street,

SAN FRANCISCO,

Surpass anything yet made in the way of an Imitation Gold Watch. They wear well, and keep good time.

The Ladies' Watches cost $8 and $10 each.
The Gentlemen's cost $15 and $20 each.
Chains, from $3 to $6 each.

RECOMMENDATIONS:

SAN FRANCISCO, May 12, 1869.

This is to certify, that I have carried one of the small size Gold Metal Watches which I got of C. E Collins & Co., and I find that it runs as well, and keeps as good time, as any watch I ever carried, and I can therefore recommend them. I am engnged on the Sncramento steamer "Chrysopolis." C. A. COLBY.

I am engineer on the San Jose Railroad. I have been carrying one of C. E. Collins & Co's watches for about one year, and I can safely say it is the very best watch for time that I have ever seen. GEO. CORNWALL.
Engineer on the San Jose Railroad.

MESSRS. C. E. COLLINS & CO:—Having heard your watches spoken of in the highest manner, I have resolved to order one for myself. You may send me one of the Lady's $10 watches, without the chain. Send it as soon as possible, as I am very much in need of a time-piece.
R. B. PATTEN,
Toano, C. P. R. R.

The public are cautioned against buying their watches at high prices, as many of them are sold for genuine *Gold Watches*, at from $100 to $150 each.

For List of Prices and Description of Goods, send directly to us. Can be sent by Express to be paid for on delivery.

C. E. COLLINS & CO.,
No. 629 Washington street, San Francisco.

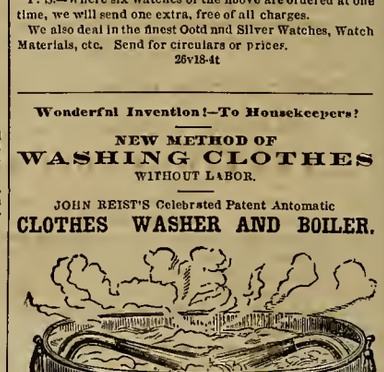
P. S.—Where six watches of the above are ordered at one time, we will send one extra, free of all charges.

We also deal in the finest Gold and Silver Watches, Watch Materials, etc. Send for circulars or prices.
26v18-4t

Wonderful Invention!—To Housekeepers?

NEW METHOD OF
WASHING CLOTHES
WITHOUT LABOR.

JOHN REIST'S Celebrated Patent Antomatic
CLOTHES WASHER AND BOILER.



This Boiler is most effectual, reliable, and universally recommended; and is the first SELF-ACTING, PORTABLE WASH BOILER, for household purposes ever made, and strange to say, has never been improved, as nearly all others, which are infringements, have proved total failures. See decision U. S. Patent Office, November 6d, 1868. See its wonderful operation and you cannot do without it. WM. FRIEL, Agent for San Francisco.
Dealer in Stoves and Tinware.

Inventions and Patents.

New Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.]

Copies of U. S. Patent Claims furnished immediately at small cost. Full copies of American or Foreign Patents can be obtained by telegraph or mail through this office at favorable rates.

For the Week Ending June 15th.

Automatic Fan.—David Aaron, San Francisco, Cal.—91,297.

I claim giving the fan E, pivoted at *b*, a quick return-motion by means af the slolted bar G, wrist-pin *a*, and disk D, driven by a spring and gears, or other maving power, substantially as set forth.

This iuvention consists in connecting a fan to a train of gears in such a manuer that it will be given a fanning motion by the movement of the train, and is especially adapted for nse in the sick-room. It will also bo a delightful breeze generator during the heated months of summer, producing the desired effect automatically, without any effort on the part of the person being fanned.

Steam Engine Stop Valve.—William H. Howland, San Francisco, Cal.—91,337.

I claim, 1. The coustructian and arrangement af the above-described valve, with reference to the case A, provided with the recess E, and the ports K and J, substantially as specified.

2. The aoft-metal packing *c*, when arranged longitudinally through the face of the arms F, substantially as described.

The object of this p.resent invention is to provide an improved cock which may be used as a gaugo-cock for steam boilers, or an oil cup which shall introduce a certain quantity of the lubricant, at any time. It may also be nsed as a faucet for beer and other liqnids, throttle-valve for steam pipes. and for all purposes where an ordinary stop-cock is used, bnt with the advantage of always remaining tight without being tapered, while it is not liable to become fast in its seat, and can be constructed at a much less cost than other cocks.

Steam Plow.—Linus Stewart, San Francisco, Cal.—91,383.

I claim, I, The arrangement of the revolving cutters within a supplementary frame, all in the same line, at right angles to the line af travel, and sa placed that the curves described by the arms ar blades *a1 a1* may intersect each other, substantially as described.

2. The horizontal connecting-shaft G, united to the shafts *a* and *a2*, by universal joints *b b*, substantially as and for the purpose described.

This invention relates to improvements in steam or locomotive plow and cultivators for turning and pulverizing the soil and preparing it for the different purposes of agriculture. In this plow the soil is cut and turned by plow-shaped cutters or arms arranged around a central hub. These revolving plows are carried at the rear of the machine upon horizontal shafts, inside of a movable supplementary frame, and are operated by gearing connected with the engine, which is carried upon the frame of the plow. These plows or cutters cut the soil transversely to the travel of the plow. The supplementary frame inside of which the cutters revolve, is raised or lowered by a novel contrivance, so that the plows can almost instantly be raised out of the ground when necessary, in order to avoid any obstruction which may he in the way. The horizontal shafts which transmit the motion to the cutters, extend almost the entire length of the plow, and are made in sections and connected together by universal joints, so that they will accommodate themselves to any elevation or depression of the cutters.

The Correct Figures.—A number of errors relating to figures have crept into our print unavoidably, that demand correction. In the issue of June 12th, the first undercurrent sluice at the American mine yielded from $300 to $800 to the *run*, not to the man; and the last one $50 por *month*, instead of to the ton. The hight of the channel above the present Yuba is about 750 feet instead of 1,500.

The greatest fault known to which we can point authoritatively (samo date, on the Geology of Treasure Hill) is not a *mile* vertically, but a quarter of a mile, or 1,320 feet; see article "Fault" in Humbles' Dictionary of Geology.

M. Michotte, of Brussels, has purchased all Rosinni's unpublished works for 150,000 francs.

Company Transactions.

New Incorporations.

The following new companies have been incorporated:

Excelsior S. M. Co.—White Pine. June 24th. Capital stock, $1,600,000.

San Fernando Tunnel and S. M. Co. White Pine District.

Washtello M. Co.—White Pine District.

Potosi Tunnelling Co.—White Pine District.

California and Nevada Smelting and Reduction Works.—Nevada. Capital stock, $100,000.

Petaluma and Cloverdale Railroad Co.—June 22d. Capital stock, $1,400,000. Directors: William Zaitman, W. D. Bliss, H. T. Fairbank, F. W. Lougee and Alex. McCuno.

Haywood Park H. A.—June 24th. Capital stock, $55,000.

Larkin and Greenwich Street H. A. June 24th. Capital stock, $6,000.

Menlo H. A.—June 18th. Capital stock, $74,760. Trustees: J. D. Fry, T. L. Thever, E. Martin and S. P. Middleton.

Meetings, Elections, Etc.

Spring Valley Water Works.—June 2d. Trustees: John Parrott, Lloyd Tevis, W. F. Babcock, Charles Mayne, J. D. Walker, N. G. Kittle and Charles E. McLane. W. F. Babcock, President; and H. Watson, Secretary.

Silver Wave M. Co.—June 2d. Trustees: M. J. McDonald, W. J. Williams, W. N. Hawley, L. J. Lewis and C. W. Fox. President, W. J. Williams; O. D. Squire, Secretary.

Alpha Consolidated M. Co.—June 21st. Trustees: J. D. Fry, Thomas Bell, A. Hayward, L. Gerstle and Thomas Sunderland.

Pogonip and Othello M. Co.—June 21st. Trustees: F. F. Low (President), M. Livingston, Geo. W. Beaver, and Geo. Oulton (Superintendent). W. W. Stetson, Secretary and Treasurer.

Oakland North S. M. Co.—June 18th. Trustees: John Gray, J. H. Alderson, S. E. Oakley, G. W. Stewart and E. O. Brown. John Gray, President; and J. M. Buffington, Secretary and Treasurer.

Mahogany from Central America.—Upwards of three hundred large mahogany logs may he seen at Hobbs, Gilmore & Co's box factory on Market street. They came from Central America, where a large supply can be obtained for this market at a much less cost than similar wood from the East.

Silver Wave Mining Company, White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventh day of June, 1869, an assessment of twenty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary at his office, No. 418 California street.

Any stock upon which said assessment shall remain unpaid on the eighth day of July, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the twenty-eighth day of July, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.

Office, No. 418 California street, San Francisco. je12

Machinery.

VARNEY'S PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everre-quired repairs. The constant and increasing demand tar them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

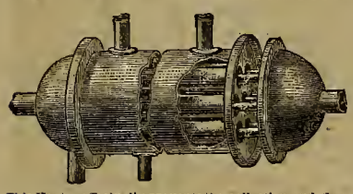
The pan being filted, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and com pletely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the office, **329** Fremont street,

1v1 San Francisco.

CROSS' COMBINED Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

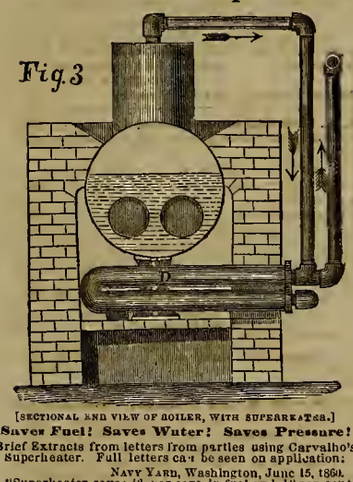
Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Barglon, at Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

WM. B. CROSS,
16v18-3m Patentee, Sacramento, Cal.

Important to every one using Steam for any purpose.

CARVALHO'S Patent Steam Superheater

Fig. 3



[SECTIONAL AND VIEW OF BOILER, WITH SUPERHEATER.]

Saves Fuel! Saves Water! Saves Pressure!

Brief Extracts from letters from parties using Carvalho's Superheater. Full letters can be seen on application:

NAVY YARD, Washington, June 15, 1869.

"Superheater saves 12 per cent. in fuel and 10 per cent. more in speed of engine."

NAVY YARD, Washington, Oct. 8, 1867 (after *seven* years of service.)

"Superheater yet attached to boilers, and appears to be in good order."

HOWARD WATCH AND CLOCK CO., Boston, May 19, 1866.

"Superheater saves us at least 10 per cent. in fuel and gives a large increase of power."

JONES & SMITH, New York, March 21, 1867.

"Superheater saves 20 per cent. of coal, less steam pressure, exhaust more serviceable in drying paper."

STEAM ENGINE WORKS, Soutb Brooklyn, April 23, 1867.

"Superheater saves not less than 20 per cent. fuel; no priming!"

CROCKETT LEATHER CLOTH CO., Newark, N. J., Oct 16, '67.

"Superheater economizes 25 per cent fuel; does our work with 25 lbs. less pressure steam, and steam superior for drying purposes."

N. Y. DYEING & PRINTING ESTAB., Oct 4, 1867.

"Superheater brings contents of our dye vats to boiling point in one-third less time and one-third less increase of water; saves us at least 15 per cent. fuel."

CONTINUOUS OIL REFINING CO., Binghampton, N. Y., Sept. 20, 1867.

"Superheaters give entire satisfaction, and we superheat to 55 deg—an increase of 200 deg."

CAREW MANF. CO., So. Hadley Falls, Mass; Oct. 17, '67.

"Superheater saves 15 or 20 per cent. fuel; steam for paper mill now perfectly pure and dry—an important advantage in our business."

STATEN ISLAND FANCY DYEING ESTAB., June 18, 1867

"Superheater saves at least 25 per cent in fuel, and we have the advantage (hardly to be over-estimated) of perfectly dry steam."

ÆTNA IRON WORKS, San Francisco, Sept. 15, 1867:

"Superheater saves 25 to 30 per cent. in fuel; no priming."

CANTRA COSTA LAUNDRY, Oakland, July, 1868

"Superheater causes a use of 50 tbs. steam instead of 60 lbs.; use much less water, and there is a saving in fuel."

BAYLISS, M. Co., Cal., August, 1868.

"Superheater causes a use of 40 tbs. steam instead of 60 lbs.; use much less water, and there is a saving of fuel." (2 sets.)

SIXTH MECHANICS' INST. FAIR, S. F. Sept 4, 1868.

"Superheater used proves that it saves fully 30 per cent. in fuel." (Chief Engineer.)

NEVADA MILL, Virginia City, May 30, 1869.

"Superheater is a perfect success, and saves 4 to cords of wood in eight, or 25 per cent. in fuel; engine works better."

And many other letters of the same tenor.

Awarded Silver Medal, Mechanics' Institute, San Francisco, 1868.

Awarded Silver Medal, Maryland Institute, Baltimore.

Awarded Silver Medal, American Institute, New York, 1865.

CCCCC VOLUME V. YALE.

The College Courant.

A New Volume commences with July. Now is the time to subscribe!

What is the College Courant?

It is a live *weekly*, fully up to the times.

It is a mere students' paper, without responsible publisher.

It is a journal with an Alumnus as publisher, and three as editors.

It is NOT a new, visionary enterprise, an experiment.

It is a paper well established and well sustained.

It is NOT the organ of any sect, party, society or clique.

It is a national college, scientific and literary paper.

It is NOT a weak, starving child, begging for support.

It is a paper that has reached a strong manhood.

It is NOT a small sheet on poor paper, printed with old type.

It is 30 by 46 inches in size,—16 pages, beautiful in typography.

It is NOT a receptacle of prosy educational essays.

It is the repository of the best thoughts of the ablest writers.

It is NOT a refuse basket for stale gleanings.

It is a paper with the freshest news, and discussing live questions.

It is NOT a paper containing matter of vital interest to every educated person.

It is NOT made up of a promiscuous mass of materials.

It is a paper with its matter well classified and well arranged.

It is NOT a heavy quarterly or a prosy monthly.

Perhaps we cannot give a better idea of the paper, than by enumerating a few of the

CONTRIBUTORS SINCE JULY 1, 1868.

President Woolsey, Yale, (four articles); President Chadbourne, Wis. Univ., (four articles); President Blanchard, Wheaton Coll., (three articles); Prof. J. Bascom, Williams, (four articles); Prof. J. D. Dana, Yale (six articles); Prof. E. R. Ruggles, Dartmouth, (two articles); Prof. E. D. Sanborn, Dartmouth, (two articles); G. M. Beard, M. D., (ten articles); Prof. J. M. Hoppin, Yale, (three articles); Prest. Wheeler, Baldwin Univ., (two articles); Hon. R. O. Smith, (ten articles); Prof. P. Kellogg, (two articles); Pres't Barnard, Columbia Coll.; Prof Alex. Winchell, Univ. of Michigan; Prof. Noah Porter, Yale; Prest J. . Tuttle, Wabash Coll.; Prof. W. F. Whitlock, O. Wesleyan Univ.; Prof. O. F. Lumry, Wheaton; Prof. Sanborn Tenney, Williams; Prof. H. N. Day; Prof. Elias Loomis, Yale; Prof. Chas. Martin, Hampden Sidney; Prof. Schele de Vere, Univ. of Va; Prest Fairchild, Oberlin Coll.; Prof. Cyrus Northrop, Yale; Prof. W. S. Tyler, Amherst; Rev. L. Bacon, D.D.; Prof T. Dwight, Yale; Prof. O. C Gilman, Yale; Prof. O. H. Wheeler, N. W. Univ.; Oonuld G. Mitchell, and scores of others.

THE COURANT, the coming year, will as is excel the past in value and interest, as the past has excelled any previous year. No College President, Professor, Alumnus, student or liberally educated person can afford to be without it.

THE SCIENTIFIC DEPARTMENT,

Edited by one of the Professors of Yale College, contains the most important scientific intelligence, most of which is translated for it from the leading French and German Scientific periodicals.

Its departments of College News, Personals, Gossip, Foreign Notes, etc , contain, in a condensed form, everything of importance concerning the colleges of this country and Europe.

☞ Specimen Copies sent on receipt of stamp.

TERMS.—One year in advance, $4; Single copies, 10c.

SAN FRANCISCO

Pioneer Screen Works,

JOHN W. QUICK, Manufacturer,

Removed to A. Pritzel's Iron Works, 203 Fremont street, near Howard, San Francisco.

Screen Punching in all its branches, at rates reduced from 25 to 40 per cent less than the established rates. I can furnish Improved Quartz Screens several sizes finer than any Screen ever punched, giving universal satisfaction, and for strength, cheapness and durability are not excelled. Also, Punched Screens of all sizes and fineness made from all qualities of material, for Quartz, Cement, Flour and Rice Mills, etc. Screen Punching made a specialty; therefore millmen forwarding their orders to me will receive none but the best. Orders solicited.

N. B.—J. W. QUICK is the only competent and successful manufacturer of Screens in the State, having made Screens for the principal mills in this State and adjoining Territories for many years. Quartz mill owners using punched Screens which have universally failed to give satisfaction, when visiting the city will please call and see me 5v17-1y

THIS OLD ESTABLISHED HOUSE IS IN PERFECT order for the accommodation of guests. Persons seeking comfort and economy will find this the best Hotel in the city to stop at. The Beds are new and in good order, and the Rooms well ventilated. The Table will always be supplied with the best in the market.

Prices varying from $1 50 to $2 per day for Board and Room.

FINE BATH HOUSE AND BARBER SHOP ATTACHED TO THE HOUSE.

☞ Teams belonging to the House will be in attendance at all the boats and cars to convey passengers to the House FREE OF CHARGE, and to any part of the city for **50** cents

21v12 F. E. WEYGANT, Proprietor.

RAILROAD PROGRESS.

THE completion and inauguration of the Pacific Railroad appears to be attracting considerable attention in Europe—both among capitalists and men of small means.

With the latter the effect is to attract a still larger amount of attention to this continent, and especially toward its western shores. This interest is being manifested in an increased amount of emigration westward.

The attention of capitalists appears to be especially drawn to a more close consideration of the probable effect which this great national highway is to exert upon the future commerce of the world. The impression is already quite general that some decisive measures must be taken to improve present facilities, or the East India travel will entirely pass over this road, and probably take American shipping between this port and China and Japan. To obviate this, a railroad has already been projected to connect Calcutta or one of the Burmese ports, by rail, with the head of steam navigation on the great river of Southern China. Both the English and French are also looking to other roads across the continent to the south of Mexico. Baron Burleau, the French Minister to Peru, has just passed over the Pacific road, by order of Napoleon, to examine that work, and report to the Emperor his opinions upon its international importance. The French have in view the immediate construction of a road across some portion of Central America, the management of which shall be under the personal control of the Emperor or his private agent.

Work upon the various roads in this State is being diligently prosecuted. A large amount of railroad material has arrived at this port during the few days past, among which were two large and elegant locomotives for the Central Pacific.

NORTHERN PACIFIC.—Although but little is said about the Northern Pacific Railroad, there is every reason to believe that measures are in progress, which will soon enable those who now have that enterprise in hand to commence active operations upon it. A railroad running through so high a latitude would have great obstacles to encounter in the winter time, and it is questionable whether it could sustain itself, in competition with the existing road, and the one that is pretty certain to be built further south. However, these are days of wonderful conceptions, and the Northern Pacific Railroad may be regarded as a foregone conclusion.

SOUTHERN PACIFIC.—One hundred and fifty miles of the Memphis and El Paso Railroad, to connect ultimately with San Francisco, will be completed to Texas this summer. The iron has already been purchased, and will be on the ground in less than a month. Fremont has gone to Europe to raise funds for the completion of the road, and add another grand chain with which to link the East with the West.

CITY RAILROAD CONSOLIDATION.—Efforts are being made, in this city, to effect a consolidation of some or all of our city railroads. Several meetings, with this end in view, have been held the past week.

GEO. E. ROGERS,

(Successor to O. W. Bell.)

ASSAYER,

512 California st., San Francisco.

J. A. MARS, Assayer.

Ores carefully Assayed. Gold and Silver Ores worked.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Metallurgy.

MOSHEIMER'S
PIONEER MINING SCHOOL,
—AND—
METALLURGIC WORKS.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of

Chemistry, Assaying and Metallurgy,

That I am prepared to teach all the above branches in less time than in any European School.

I also undertake to assay and work any kind of ore, or mineral substances.

For terms, apply to **JOS. MOSHEIMER,**
Practical Chemist and Metallurgist.

Office, 323 Montgomery street; Metallurgic Works, 2006 Powell street, San Francisco 6v18-6m

LEOPOLD KUH,
Assayer and Metallurgical Chemist,

(Formerly of the U. S. B. Mint, S. F.)

Office, No. 611 Commercial Street, opposite the Mint, San Francisco.

BULLION MELTED AND ASSAYED,

The correctness of which is guaranteed in every respect All kinds of Ore and Mineral tested, assayed and analyzed in the most satisfactory manner.

Refers by permission to W. C. Ralston, Cashier Bank of California; Messrs. Ploche & Bayerque, Wm. M. Lent, John D. Fry, E. Cahill & Co., A. K. Grim, President Pacific Union Express Co.; John M. Eckfeldt, M. and R. U. S. B. Mint. Hale & Norcross S. M. Co., and the principal mining companies on the Comstock Lode. 25v17-tf

PROF. HENRY WURTZ,

Formerly Chemical Examiner in the U. S. Patent Office may be employed professionally as a SCIENTIFIC EXPERT. Geological Examinations and Reports, Analyses and Assays, etc., etc. Practical advice and investigations in the Chemical Arts and Manufactures. Invention and examination of new chemical methods and products. Address, 26 Pine street, Rooms 35 and 36, New York. Always in from 12 to 3 P.M. ☞ Written communications preferred.

Important to Gold and Silver Miners and Companies.
PROFESSOR WURTZ,

Who is the inventor and Patentee of the new and wonderful uses of SODIUM IN WORKING GOLD AND SILVER ORES AND JEWELERS' SWEEPINGS, will furnish at the above address information in relation thereto, together with experimental packages of

SODIUM AMALGAM.

All instructions and experiments elsewhere obtained are spurious and unreliable. WORKING EXPERIMENTS ON AMALGAMATION OF ORES, Etc. Prof. W. has in operation in New York a large and small Hepburn Pan, for working 1,000 or 20-lb. charges of material for experimental purposes. 3v17-1y

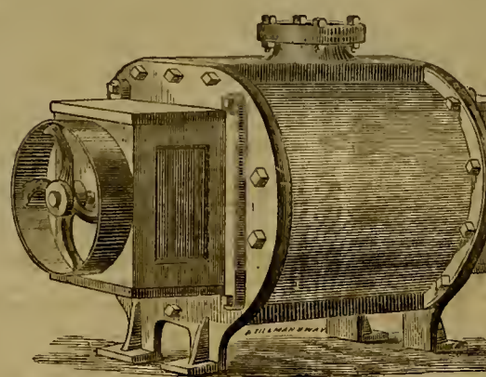
Notice to Miners,
Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,
8v13-1y Stove Store, No. 1 Clay street, below Davis.

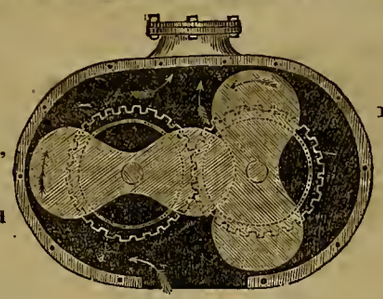
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.
MANUFACTURED BY KEEP & BARGION,
At the Globe Iron Works, Stockton, California.



Awarded the First Premium at the Paris Exposition.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

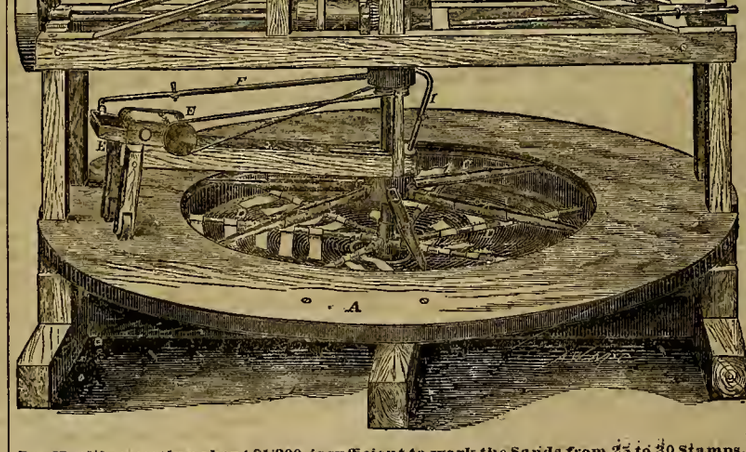
Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

KEEP & BARGION,
4v16 3m **Globe Iron Works, Stockton, Cal.**

PAINE & STEPHENS'
IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.



One Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps,

Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Banner Co's mill near Nevada, and see for themselves.

CERTIFCATES:

☞ GRASS VALLEY, Jan. 4th, 1869.—This is to certify, that we have used the Paine, Stephens & Harry Concentrators for over twelve months. They have given us entire satisfaction, and are the best we ever used. WILLIAM WATT, Supt. Eureka Mine.

This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphuret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets.
WM. L. TISDALE, Supt. Star Spangled Banner Mine.

NEVADA CITY, Oct. 26, 1868.

Any one wishing to purchase one of these useful machines, can do so by applying to THOS. N. PAINE, at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.
